## THE PHYSIOLOGIC APPROACH TO OTOLARYNGOLOGY

CHAIRMAN'S ADDRESS

RALPH A. FENTON, M.D.

PORTLAND, ORE.

The great progress that has come to the specialty of otolaryngology in America during the past fifty years makes it profitable to take account of the stages by which this advance has been achieved. The exactions of professional education and the demands of a busy practice not infrequently prevent one from following collateral lines of medical reading and may interfere with one's awareness of the discoveries which may—not now perhaps, but later—become the foundations of an increasingly valuable system of diagnosis and therapeutics.

It is of course much easier to follow remembered routine from special internships or from intensive courses of study, without bothering to add thereto anything save some highly touted medicament or impressive bit of apparatus recommended by pharmaceutical detail men or pseudomedical advertising magazines. Careful tests by the Council on Physical Therapy and the Council on Pharmacy and Chemistry are available for all such matters, and some of us might be saved eventual embarrassment by resort to their records, before rushing into print in praise of therapeutic methods that are based on special financial returns to certain manufacturers or promoters. Empiricism, whether based on laziness or on credulity, has never spelled progress. "Such intemperate promises readily insinuate themselves into the minds of youth, who, ignoring the many almost unconquerable difficulties lying ahead, proceed with bold independence and then find themselves in difficulties, to the prejudice of their own reputations and of the health of others"; thus wrote Antonio Scarpa, surgeon-anatomist, 135 years ago.

Perhaps some may more readily accept such hearsay evidence because most of us, as otolaryngologists, are graduates of the school of anatomic rather than pathologic or physiologic research; and on such anatomic foundations have been built splendid surgical knowledge and incomparable refinements of technic.

Scientific method, however, would include accurate determination of the physiologic data respecting each branch of our specialty, and of the resultant pathologic changes. We have perhaps been sent on a detour by the insistence of our confrères the internists for eradication of focal infection.

We have shared enthusiasm and disillusion respecting bacterial infestations, opsonins, toxins, resistance, vaccines, and the like. On the basis of known values established in the cure of deficiency diseases with otorhinologic complications, elaborate dietary systems and biochemical indexes have been set up for easy clinical application to all sorts of cases; and here disappointment has often followed. Too rarely are our most expert clinicians well grounded in otolaryngologic histopathology, a defect rapidly being remedied in graduate teaching.

The physiologic approach to otolaryngology was for many years a matter of measurement of motor or sensory functions—hearing and vestibular tests, olfactometry, vocal cord movements, nasal air capacity and currents and the like, all valuable clinical indexes, based however on gross phenomena. Of recent years, with the collaboration of highly trained histopathologists, biochemists, physiologists and endocrinologists, many important contributions to the physiology of our specialty have appeared.

Experimental observations, begun with frogs, rabbits, dogs and cats, carried on with monkeys and eventually demonstrated in man, have extended our knowledge of the cellular activities of normal and diseased ciliated membranes and have explained the growth, destruction and regeneration of these structures. Vital staining has had an important rôle in this study, as also on the revaluation of the problems of pneumatization of the temporal bone and of osteogenesis following osteomyelitis. The fibrogenic powers of phagocytic connective cells have been demonstrated.

Artificial sinus infections have been studied to disclose the etiology of cyst and abscess formations, of osteomyelitis of the frontal sinus, of epidural abscess. Nasal mucus has yielded up its protective content of lysozyme, and its normal immune powers have been enhanced by astringent applications. Viruses within this secretion have been isolated, vitally cultivated, and preserved while transported from Point Barrow to New York, and routes of other viruses into the central nervous system along the olfactory sheaths have been discovered.

In otology, mensuration of cochlear function has been carried into the eighth nerve, tone by tone, through electrical amplification. The ossicular muscles have been studied under the dissection microscope and their specific responses to sound stimuli accurately reported. From the vestibular system, six separate pathways for forced movements have been worked out, and the complex anatomy of the cerebellum has been unraveled through careful study of its developing tracts in the lowest vertebrates. The use of human immune serum instead of vaccines, and of transfusion instead of jugular ligation, has offered hope in recent otologic practice, in meningitis and in sinus thrombosis.

Causing the vibrating vocal cords to stand still on a given note through stroboscopy now affords accurate analysis of vocal faults and incipient paralysis. Far more valuable clinically was the mapping and identification of the bronchial end-organs and innervations concerned in coughing. Study of the pathology of atelectasis, of bronchiectasis, of silicosis, of pulmonary malignancy, has been worked out under the bronchoscope. Perhaps similar interpretation of increased fibrosis and glandular proliferation low in the esophagus may be reached by esophagoscopy study.

Dr. Mosher twelve years ago set up several unsolved problems for otolaryngology. The problem of meningitis may yet be managed through better understanding of brain physiology. That mucous membranes contain phagocytic mesenchymal cells which develop into fibroblasts explains connective tissue formation in deaf ears but doesn't get rid of it. Radiation effects in malignancy have been carefully reported. Death of lymphocytes with release of their contained immune substances and intruding of phagocytes is a constant finding after irradiation of low intensity. The tonsil problem, also, receives a physiologic rather than a surgical interpretation at present. Epidemiologists have definitely incriminated the nose as a portal of infection for the so-called virus diseases. Such in brief are some physiologic answers to the "unfinished business" of 1924.

Here are some new problems recently propounded: Are the viruses, known already to be transmissible, possible of isolation as crystallizable protein compounds? Are these nonliving compounds needed catalyzers to permit bacterial invasion? What is the nature of allergic sensitivity and how may it act within the central nervous system, notably of the vestibular end-organs and the basal cisternae? How often are migraine and vertigo allergic? What is the biochemistry of endocrine products as applied to otosclerosis, to asthma and to mucosal edema? Is the body's resistance to infection based on its oxygen intake? How may we solve the problem of lymphatic drainage from the sinuses? What is the exciting factor in carcinoma?

It will be seen that some of these matters depend on the autonomic nervous system, on which, as on the sinuses in years past, many surgical attacks are now being made. But the physiology of this great system is far from clear, and its ramifications are infinitely difficult in our special field.

Knowledge of the fundamentals of otolaryngologic physiology, interrelating various new discoveries and applying them to our field, will not teach us anything about surgical indications or surgical technic. But it may lead to a better understanding of the need for surgery and will be of great help in the application of modernized principles of immunity for the prophylaxis of disease of the upper respiratory tract.

Mosher once said "There is no pleasure so great as having your little try at the solution of some medical problem. . . . Support or no support, research work has been done for years on the side, as it were, and probably always to a certain extent will be done in this way. You and I have so done it. Better men than we will do the same. The urge to do it has come down the ages. . . . The worker is not to be pitied. Rather he is to be envied, because . . . the world of medicine becomes for him a world of romance."

Given such leaders and such inspiration, otolaryngology in America will continue its progress, through insistence on higher standards of individual preparation, and greater interest by individuals thus prepared

in the physiologic relationship of our special field to the various systems of the body as a whole. Team work with other members of hospital staffs often points to the way to interesting bits of research. Each one among us, however far away from others in the specialty, should feel that he is a collaborator, through his reading and his papers before local medical groups, in the task of appraising the general profession that we are not immediately bent on drastic surgery but that we are building, through physiologic and pathologic knowledge, a sound foundation for the medical and surgical otolaryngology of the future.

1020 Southwest Taylor Street.

## THE INCREASED METABOLISM OF OBESITY

### USE AND ABUSE OF METABOLIC STIMULANTS

JAMES J. SHORT, M.D.

Assistant Professor of Clinical Medicine, New York Post-Graduate Medical School of Columbia University

AND

HARRY J. JOHNSON, M.D.

Instructor in Medicine, New York Post-Graduate Medical School of Columbia University

NEW YORK

The title of this article was chosen to focus attention on the fact that with increasing weight there is concomitantly an increasing total resting metabolism. That is, a person produces more heat when overweight than at normal weight. For instance, in the individual at normal weight under basal conditions heat is being produced at a certain rate per unit of surface area. When the same person increases his weight, for example by 50 per cent, the surface area is also increased to accommodate this additional fat. If the heat production per unit of surface area is the same in the two instances, the total heat production in the obese state is obviously greater.

This relationship between weight and total metabolism has long been known<sup>1</sup> but has been obscured by the emphasis that has been placed on basal metabolism to the exclusion of the total. Evans and Strang<sup>2</sup> Du Bois<sup>3</sup> and Newburgh<sup>4</sup> have recently called attention to the importance of giving heed to the total metabolism.

Basal metabolism as usually reported is the heat production per unit of body surface per unit of time (calories per square meter per hour), whereas total metabolism (total heat production) is the heat production of the organism as a whole per unit of time (total calories per hour), both measurements taken at complete rest. The basal metabolism is customarily expressed in terms of percentage above or below an average normal established for an individual of the same sex-age incidence. The total resting metabolism is likewise expressed in this article in percentage above or below an assumed normal.

From the Department of Medicine, New York Post-Graduate Medical School and Hospital.

The authors are indebted to Mr. Arthur Gallagher and Mr. Samuel Member for assistance in compilation of the data and preparation of the charts.

4. Newburgh, L. H.: The Importance of Actually Measuring the Total Heat Production, *Arch. Int. Med.* 8: 459 (Oct.) 1934.

The question may be asked, Why does surface area enter into the calculation? Why is basal metabolism expressed as calories per unit of surface area instead of for the total surface area? Because empirically a close relationship has been discovered between surface area and vital protoplasmic mass. The volume of such

Chart 1.—Basal metabolic rate (calories per square meter per hour) and resting total heat production (total calories per hour) in overweight. Both are expressed in percentage above or below the theoretical normal.

protoplasmic mass can be estimated from the surface area and thus, since surface area represents protoplasmic mass, definite comparisons are possible between heat outputs per unit of surface area of different individuals.

Such a relationship between heat producing protoplasmic tissue and surface area thus constitutes a valid basis for comparison of metabolic rates when weights (and surface areas) are within normal limits. When some abnormal accumulations such as water or fat occur, an expression of the basal metabolism as calories per unit of body surface does not give a true picture of the total metabolism or of the rate of energy exchange in the vital heat-producing body tissue cells. Since such accumulations are relatively inert<sup>5</sup> and not direct heat producers, they might be regarded as parasitic in that they derive their heat largely from functioning muscle and gland protoplasm. Nevertheless they increase the total body surface area. The calories per unit of surface area (the basal metabolism) can remain normal (as is usually the case in fat accumulations) and yet the total heat output be greatly increased over what it would be at normal weight.

5. To demonstrate that fat tissue takes little of body heat, we carried out the following experiment on this question: A long needle with a thermocouple was introduced through a thick layer of fat in the gluteal regions of obese individuals. The temperatures were recorded by means of an electrical recording apparatus. It was found that the lowest temperature was just beneath the skin and that the temperature gradually rose as the muscle was approached. A sudden abrupt elevation to the usual body temperature was finally noted and was assumed to be at the point of entry of the thermocouple into the muscle.

#### METHOD OF STUDY

Determinations of metabolic rates were done by the gas analysis method in the respiration laboratory of Dr. C. V. Bailey, the Du Bois standards being used.

The total calories per hour of the obese subjects at rest were compared with the established normal standards for an individual of the same sex and age having normal weight and surface area.

The theoretical normal of total calories per hour for an individual was determined by multiplying his normal number of calories per square meter per hour (Du Bois standards) by his square meters of surface area if he were at normal weight. The assumed normal weight was obtained from insurance charts with due consideration of sex, age, height and frame. From the height and normal weight, the normal surface area was obtained by nomogram.

In obese individuals the resting total heat production is almost always above normal. The greater the percentage of overweight, the greater is the percentage elevation of the resting total metabolism.

#### RESULTS OF STUDY

Chart 1 is a graphic representation of the basal metabolic rate and resting total heat production in ninety-nine overweight patients. The ordinate represents the percentage of metabolism above or below normal, while the abscissa represents the percentage of overweight. It will be noted that the overweight cases range from normal to 135 per cent above normal. In the lower overweight percentages the majority of the basal metabolic rates are below normal, whereas in the more marked cases higher rates prevail. This upward

Chart 2.—Percentage increase of surface area and total heat production that accompanies increasing overweight. Note also the upward trend of the basal metabolic rate and the blood pressure with increasing obesity. 1. Per cent overweight. 2. Surface area. 3. Basal metabolic rate. 4. Total heat production. 5. Basal pulse. 6. Blood pressure. 7. Pulse pressure.

trend of metabolism is much more noticeable in the total heat production. In all cases presenting 20 per cent and more of excess weight, the average percentage of overweight was 62, of basal metabolism + 1 and of the total heat production + 22.5.

A further attempt to show trends is represented in chart 2. In each group of columns is expressed the average percentage of overweight and of increase of surface area, basal metabolic rate, resting total heat

production, basal pulse rate, blood pressure and pulse pressure. These data are averaged for groups of 20 per cent of overweight (i. e., 0-20, 20-40, 40-60, and so on). Averages of overweight increase progressively from 11 per cent in the first group to 136 in the last. The average basal metabolism shows an upward trend from minus 4.5 in the first group to plus 5.5 in the last. A decided exception is seen in the 100 to 120 per cent overweight group, in which the average basal metabo-

Chart 3.—Cases grouped according to basal pulse rates: group 1, in which averages of pulses were below 80; group 2, in which averages of pulses were above 80. 1. Pulse. 2. Per cent overweight. 3. Basal metabolic rate. 4. Total heat production. 5. Blood pressure. 6. Pulse pressure.

this chart reveal nothing of moment, although a possible significance of the pulse rate is suggested in chart 3.

Since an increased pulse rate is the most constant finding in increased metabolism, eighty-three cases in excess of 20 per cent overweight were divided into two groups, those with resting pulse rates of less than 80 and those with rates over 80. The average pulse, percentage overweight, basal metabolic rate, total heat pro-

duction, basal pulse rate, blood pressure and pulse pressure. This group contained ten patients, of whom three had plus basal and seven had distinctly diminished rates. So definite is the upward trend of the basal metabolism with increasing overweight, however, that we feel confident that a larger series of cases in this group would average well above the normal.

The surface areas and resting total heat productions show the expected increase with progressive overweight. There is a definite increase in the blood pressures and pulse pressures in the higher ranges of overweight.

Average pulse rates on

#### THEORETICAL CONSIDERATIONS

It is evident from the foregoing that in obesity there is an increase in the total metabolism. Since fat is comparatively inert, this increased heat production must be brought about by an increased activity of the muscle and gland tissues of the body. Apparently the muscle and gland cells are stimulated to a higher rate of oxidation with an increase of heat and energy production. It is impossible to state the extent to which the fat tissue participates in this increased activity but it is probably only to a relatively small degree. Other things being equal, the increase of heat production is directly proportional to the increase of surface area. Conversely, a reduction in weight brings about a reduction of resting total metabolism in direct proportion to the reduction of surface area. This is well illustrated in the accompanying table (patient M. S.). It should also be noted that all cases showed a reduction of total heat production following a reduction in weight.

We do not maintain that the exact percentage of fat in the body can be determined by the methods employed; the excess weight percentages are but approximate at best. The same must be said for surface area estimations as ordinarily determined from nomograms and consequently for figures used to express basal metabolic rates and relative total heat productions.

It has been shown<sup>6</sup> that weight reduction with proper diet represents a loss of fat, with associated salts and fluids, but not a loss of muscle and gland tissue, since nitrogen equilibrium and a constant level of creatinine excretion are maintained.

The question naturally arises as to the modus operandi of the increased metabolism in obesity. Since the thyroid gland is known to be one chief regulator of the metabolic rate, it would seem logical to assume that it might play a part in this connection. Certain indirect evidence of increased thyroid activity has been adduced in addition to the simple fact of increased metabolism. Increased pulse rates and blood pressures in the higher ranges of total metabolism, frequent diminution of dextrose tolerance<sup>7</sup> and a general upward tendency of the basal metabolisms with increasing weight are all suggestive. That hyperthyroidism could

\* Note the drop in total calories per hour (in M. S.) even when the basal rate remains constant.

duction, blood pressure and pulse pressure were taken for each group. The results are expressed in chart 3.

The average pulse was 65 in the first group and 85 in the second; percentage overweight 61 in the first and 73 in the second; basal metabolic rate -1 in the first and +6 in the second; resting total heat production +17 in the first and +33 in the second; blood pressure 137/89 in the first and 137/88 in the second; pulse pressure 49 in the first and 52 in the second. These figures show that tachycardia occurred in the more pronounced overweight group with an average increase of 7 per cent in the basal metabolism and of 16 per cent in the total heat production.

exist without an abnormally high basal metabolism might appear to be somewhat revolutionary according to current diagnostic concepts but in our opinion is not beyond the realm of possibility. Final statements cannot be made without further study of this question.

#### METABOLIC STIMULANTS

Since in obesity there is already an increased total metabolism, the giving of metabolic stimulants in the form either of thyroid preparations or of drugs such

6. Strang, J. M.; McCluggage, H. B., and Evans, F. A.: The Nitrogen Balance During Dietary Correction of Obesity, *Am. J. M. Sc.* 151: 336 (March) 1921.  
7. Unpublished data.

as dinitrophenol is entirely illogical. At this stage such stimulants are not well tolerated. It was the experience of one of us (J. J. S.) that thyroid extract caused toxic symptoms to become manifest very rapidly in a number of such cases, although the explanation at the time was not well understood. As pointed out by Evans and Strang,<sup>2</sup> many obese patients with high total heat production already manifest certain toxic symptoms characteristic of exophthalmic goiter. Additional stimulation would seem to be unwarranted and dangerous.

It is not our purpose to stress the inherent dangers in the administration of such a toxic substance as dinitrophenol. Reports of poisoning have already been noted in the literature.<sup>8</sup>

Is thyroid extract ever indicated in obesity? It has been our policy to administer it in certain cases with low basal metabolism without regard to the height of the total metabolism. It is a common experience to note with dietary restriction an early drop characteristic of the fasting state both in basal and in total metabolism. This takes place even before any significant amount of weight has been lost and is therefore not an expression of a diminished surface area. Somewhat arbitrarily, perhaps, we have administered thyroid extract when from clinical signs it was assumed that such a drop in metabolism had taken place. When possible, the dosage has been gaged by repeated basal determinations. In other cases the pulse rate and general symptomatology were our guide.

#### SUMMARY

A series of patients ranging from 1 to 135 per cent overweight has been studied as to surface area, basal metabolism, total heat production, pulse rate, blood pressure and pulse pressure. It has been shown that with an increasing percentage of overweight there is a progressive increase in the resting total metabolism and a slight tendency for an increase in the basal metabolism. A study of the pulse rate has shown that those cases presenting a resting rate over 80 were definitely more overweight than those presenting lower rates, and that the total metabolism was likewise correspondingly higher. There is a possible significance of this as relating to an increased thyroid activity. Consideration has been given to the indications for the use and non-use of metabolic stimulants.

#### CONCLUSIONS

1. The total metabolism in obesity increases directly with the excess of weight.
2. The basal metabolism in obesity is usually within normal limits but tends to be in the lower ranges of normal for the slightly obese and in the higher ranges for the excessively obese.
3. The increased metabolism favors rapid weight loss on dietary restriction.
4. The employment of metabolic stimulants while normal basal and high total metabolic rates prevail is illogical and contraindicated.
5. Thyroid preparations may be employed judiciously in later stages of treatment with submaintenance diets when it can be shown or assumed that the metabolic rates have been lowered.
6. In all metabolic studies the heat production per unit of body surface (the so-called basal metabolism)

and the total heat production of the organism under basal conditions should be sharply differentiated, since they represent two entirely different approaches to the problem of obesity.

## INDUCED HYPERCALCEMIA

### ITS POSSIBLE THERAPEUTIC RELATION TO THROMBOCYTOPENIC PURPURA

HARRY LOWENBURG SR., M.D.

AND

THEODORE M. GINSBURG, M.D.

PHILADELPHIA

In 1932 we<sup>1</sup> reported a case of acute hypercalcemia caused by accidental overdosage with parathyroid extract. Search of the literature reveals no other such report in man. A white boy, aged 5 years, who was being treated for severe essential purpura haemorrhagica, had received hypodermically 5 cc. (100 units) of parathyroid extract daily for a period of five days. The earliest symptom of overdosage that he presented was vomiting. This gradually increased in severity. He became progressively listless until physical depression rendered him actually in a critical condition. He was apathetic and extremely lethargic. He had an irregular fever, which reached a high of 103 F. On the beginning of the sixth day the cause of his condition was recognized and the extract was stopped. During the period of treatment (five days), therefore, he had received in all 25 cc. (500 units). The blood serum calcium was determined to be 19.6 mg. per hundred cubic centimeters of blood. Within three days the serum calcium fell to 12.1 mg. and the patient appeared normal. Seven days after the parathyroid extract had been discontinued a roentgenographic study of the long bones was negative for absorptive or other changes. It was also noted, without any significance being attached to the observation, that during the course of the administration of the parathyroid extract the bleeding time had fallen to five minutes and ten seconds. At the time of admission a reading of the bleeding time had not been concluded after two hours' observation. Concomitantly it was likewise noted that all visible bleeding had stopped. However, since the patient had previously been treated without effect with several other measures, including transfusions and injections of antivenin, it was obvious that no therapeutic result could reasonably be ascribed to the acute hypercalcemia, even if it were theoretically tenable that such a spectacular result might be expected. The occurrence of a spontaneous remission was considered a not unlikely possibility. It may be stated, however, that follow-up studies to the present time have shown no recurrence of the purpura.

Recently another case of essential purpura haemorrhagica presented itself. Here too several forms of treatment were employed, again without result. It was recalled that the case previously reported had apparently been cured, if not because of parathyroid extract, at least after the administration of large doses. Parathyroid extract was again employed, with cure apparently again ensuing. The following case is presented not necessarily as an example of a new treatment for purpura haemorrhagica, although such a possibility sug-

gests itself, but rather in an attempt to help establish, with the previously reported case, the symptomatology of acute hypercalcemia or, better perhaps, of acute parathyroid poisoning in man:

M. L., a white boy, aged 7 years, was being treated for essential thrombocytopenic purpura. A little over a month after treatment had been instituted, particularly with moccasin snake venom as described by Peck and Rosenthal,<sup>2</sup> the patient's condition was somewhat worse than on admission. Each injection of venom was followed by extensive ecchymosis at the point of injection, and neither bleeding time nor platelet count was favorably influenced by the remedy. All other therapy, which also had been pursued without benefit, was stopped and treatment was begun, arbitrarily, with daily subcutaneous injections of 3 cc. (60 units) of parathyroid extract. Calcium gluconate, 10 cc., was given intramuscularly at the same time. This was administered to prevent depletion of the calcium content of the bones as the result of the maintenance of the artificially high blood calcium level.

Preceding the use of parathyroid extract and the calcium gluconate, for the purpose of control, the blood serum calcium

Changes in the serum calcium and phosphorus determinations in two cases.  $C_1$  indicates calcium found in case 1;  $C_2$ , in case 2;  $P_1$ , phosphorus in case 1;  $P_2$ , in case 2. The arrows indicate administration of parathyroid extract.

was determined to be 9.7 mg. per hundred cubic centimeters of blood. Serum phosphorus was 5. The following day after treatment was begun, serum calcium was 12.3 and phosphorus 5.4 mg. per hundred cubic centimeters. Nausea and vomiting developed. These, as in the first case, are apparently the earliest symptoms of the toxic manifestations of the drug. During the evening of the second day the child complained of severe pain in the lower part of the abdomen, and some tenderness was noted just above the symphysis pubis. There was, however, no rigidity. An enema returned free from blood. The stools previously had contained blood. Pain disappeared the following morning. Apathy and lethargy developed, the patient answering questions only in monosyllables and with reluctance. He was a bright, intelligent boy and previous to the appearance of the lethargic symptoms when asked the nature of his ailment would reply smilingly that he had "thrombocytopenic purpura." All his movements became slow and were made apparently with great effort. Vomiting became progressively worse and soon was persistent. On the third day of treatment with parathyroid extract, serum calcium was 15.2 mg. and serum phosphorus 6.1 mg. per hundred cubic centimeters. On the fourth day treatment with parathyroid extract was discontinued and on the fifth day serum calcium was 18.8 and phosphorus 4 mg. per hundred cubic centimeters. On the sixth day they were 11.4 mg. and 3.2 mg. respectively. On the eighth day calcium was 9.4 mg. and phosphorus 3.4 mg. per hundred cubic centimeters. At no time was there any

notable temperature elevation, although the pulse rate was markedly elevated at the height of the hypercalcemia. X-ray studies of the long bones were not made in this case.

As in the first case, there was a spectacular clinical improvement as indicated by the tourniquet test and the absence of new lesions over the surface of the body. Previous to the use of parathyroid extract some of these lesions were so large and intense as to appear as actual hemorrhages under the skin, such as would result from a heavy blow. Hematologically, soon after the beginning of parathyroid treatment the patient also showed definite objective improvement. The patient was discharged from the hospital in excellent condition, July 28, 1935. He was readmitted September 3 for a check up. Clinically he was cured, his body being free from visible lesions. His mouth and gums were normal, whereas previously large hemorrhagic extravasations had appeared in these parts as well as under the mucous membrane of the hard and soft palate and the cheeks. Hemoglobin was 90 per cent (Sahli), red blood cells 4,640,000, white blood cells 9,250, polymorphonuclears 68 per cent, large monocytes 28 per cent, transitionals 1 per cent, eosinophils 3 per cent. Coagulation time and bleeding time (both venous blood) were respectively six minutes and three minutes, platelet count 210,000, blood serum calcium and phosphorus respectively 10.6 mg. and 5.3 mg. per hundred cubic centimeters. Clot retraction was complete in one and a half hours. The tourniquet test, which had been always promptly positive within a half minute or so, was negative after three minutes.

He was readmitted, September 30, for a check up and for the extraction of diseased teeth, and blood studies showed no abnormalities. The platelet count was 290,000, bleeding time three minutes, clotting time five and one-half minutes; clot retraction was complete in four hours. The tourniquet test was again negative. Two teeth were extracted with no more than the ordinary amount of bleeding.

The changes in the serum calcium and phosphorus determinations are given in the accompanying chart. The general parallelism between the calcium and the phosphorus curves in both cases is striking. The levels of both calcium and phosphorus rise with the administration of parathyroid extract and fall promptly when the latter is withdrawn. Striking also, and worthy of emphasis, is the sharp fall in the calcium level after the parathyroid extract was stopped.

As stated in the case previously reported, on admission the bleeding time determination was not concluded after two hours of observation, but on the second day of parathyroid treatment the bleeding time fell to five minutes and ten seconds. The platelet count varied between 30,000 and 50,000, but with the administration of parathyroid extract the count steadily rose until at the conclusion of treatment it was 90,000 and three days later 110,000.

In this case the manifestations were somewhat different. On admission the bleeding time was three minutes, but there was no clot retraction. Three days later the bleeding time was six minutes, the next day forty minutes, subsequently one-half hour, and two days before parathyroid extract was begun the bleeding time determination was not concluded after two hours and there was no clot retraction. The prothrombin time soon after admission was ten minutes. After parathyroid treatment was concluded the bleeding time was fifteen minutes and a few days later four and one-quarter minutes, with complete retraction of the clot in twenty-four hours. Subsequently frequent determinations of the bleeding time revealed it to be normal. On admission the platelet count was 70,000, four days later 100,000, the next day 40,000, and then it varied between 30,000 and 60,000 for a little over a month, throughout the entire time that moccasin snake venom was being used. Thirteen days after parathyroid extract was stopped, the platelet count was 185,000.

2. Peck, S. M., and Rosenthal, Nathan: Effect of Moccasin Snake Venom (*Ancistrodon piscivorus*) in Hemorrhagic Conditions, *J. A. M. A.* 104: 1066 (March 30) 1935.

Two cases obviously are not sufficient to establish any form of treatment, especially when neither case is well controlled. The striking results, however, are very suggestive, and it would seem that the treatment of thrombocytopenic purpura by the induction of artificial hypercalcemia by the use of large doses of parathyroid extract is at least worthy of trial. As compared with other forms of treatment, one would seem to have nothing to lose. On the assumption that the apparent cures were obtained as the result of the treatment administered, no explanation is apparent to account for the results.

#### SUMMARY AND CONCLUSIONS

1. A second case of acute hypercalcemia produced by intentional overdosage with parathyroid extract occurred in a boy with thrombocytopenic purpura.

2. Toxic symptoms occurring in man are similar to those reported by many workers as occurring in animals with experimental hypercalcemia.

3. The earliest symptom is vomiting. This is shortly followed by weakness, apathy and lethargy.

4. Both patients, once hypercalcemia was established, presented definite objective changes in the blood (bleeding time, clotting time, clot retraction, platelet count) as well as clinical cure.

5. A cause and effect relationship between the hypercalcemia and the apparent cures is suggested, although there appear to be no sound theoretical grounds for such a conclusion.

6. Calcium gluconate was used to protect the bones from the withdrawal of calcium from them into the blood.

### COUNTY-WIDE USE OF IMMUNE GLOBULIN IN THE MODIFICATION AND PREVENTION OF MEASLES

E. G. McGAVRAN, M.D.  
Secretary, Hillsdale County Medical Society  
HILLSDALE, MICH.

The rich field of epidemiologic research in private and particularly rural practice has been pointed out by Milton J. Rosenau and others as a source of medical information hitherto undeveloped. The reasons for this are chiefly administrative. Individual series of any one practitioner are too small to be significant. The collecting and confirming of data from any group of physicians is time consuming and the establishing of a uniform system that is essential to comparable facts and figures is difficult in so individualistic a profession.

In the face of a predicted epidemic of measles of unusual proportion, the Hillsdale County Medical Society met the problem in a manner so effective and so fraught with possibilities for future epidemiologic research that the record of its procedures, as well as the record of its conclusions, seems worthy of publication.

For a long time, prevention and modification of measles in persons who have been exposed has been practiced by various seral methods with varying degrees of success.<sup>1</sup> It is beyond doubt a good pediatric and preventive procedure to attempt to modify or prevent measles in an exposed infant or child. The only question is through what medium shall the immune antibody be given?

Health departments have for years been advising administration of whole blood.<sup>2</sup> Such programs used by the medical profession at large have proved a failure. The chief reason apparently is that withdrawal of 20 cc. of blood looks like a major operation to most people. The injection of 20 cc. is "cruel." Many of the medical profession itself share this point of view. Further, the antibody is most indefinite and therefore "controlled modification" is difficult. The public is "serum conscious" and has not been generally educated to take or give whole blood.

Immune serum or convalescent serum has proved excellent but is expensive and in some areas difficult to procure in sufficient quantity for wholesale procedures. In a rural area the importance of conducting a "wholesale" procedure with as few as possible limiting and qualifying factors cannot be overemphasized.

Immune globulin<sup>3</sup> is only another of the vehicles to carry the immune substance or antibody. It has the advantage of being a waste product, and from 3 to 5 cc. of the extract, used by us, seems to be the equivalent of 10 cc. of immune serum or 20 cc. of adult blood.

The use of immune globulin in modification and prevention of measles is of recent origin.<sup>4</sup> Dr. Charles McKhann has used it effectively in the Children's Hospital in Boston. In 1,258 cases in which various preparations of immune globulin were administered, 95 per cent showed a prevention or modification of the disease and 5 per cent failure.<sup>5</sup> Through the kindness of Dr. McKhann, associate professor of pediatrics at Harvard Medical School, and Dr. Robinson, director of Public Health Laboratories of Massachusetts, we have received lots for both intramuscular and oral administration for use in private practice in the country.

It has long been observed that the results obtained by individuals and institutions could not be duplicated in private practice. A careful study of home and hospital cases of measles made by Karelitz and Schick<sup>6</sup> corroborates and explains this observation.

The Hillsdale County Medical Society took action early in the year endorsing a program of "measles prevention and modification" in the county to determine the value of such a program and the practical value of immune globulin in private practice. No age limitation was put on the program because it was felt that the criticism provoked would not justify the procedure. This decision by the medical society eliminated the possibility of running controls; i. e., one child protected and one not in an exposed family. In such a disease as measles this is of the least possible significance, as the percentage of disease developed in a susceptible population is over 90 per cent to intimate contact.<sup>6</sup>

The immune globulin was distributed, free of charge, to the physicians. In return the physicians kept a careful record of the cases and turned them in to the secretary of the county medical society for analysis and conclusions. From 3 to 5 cc. of immune globulin was given intramuscularly or 12 cc. orally, when possible between the fourth and ninth day after exposure. Most

of the cases reported were discussed with the secretary in respect to time of administration and probable exposures, and some of the cases were seen personally by him in consultation.

The program was preceded by newspaper publicity, talks and lectures to parent-teacher associations and to children concerning measles, its importance, its danger and the fact that now the family doctor had a "serum" that he could use which might prevent the disease temporarily or modify the disease and so prevent it for life.

The medical profession in this county was very conservative and critical of results. Because we could not get the immune globulin from the Massachusetts State Biological Laboratories we used, early in December, a commercial preparation of immune globulin. The local reactions were severe and results were only about 50 per cent successful. The criticism was so immediate that the whole matter was dropped until the arrival of McKhann's immune globulin.

The observations of the physicians of this county indicate that, in the 1934-1935 epidemic, most of the cases of measles were of an unusually severe nature, all symptoms being present, so that the effect of the treated cases stood out in bold contrast to those not receiving treatment.

In a rural practice it proved impossible to keep an accurate temperature chart over the period of modification. Frequent calls on all patients immunized were not possible and not necessary according to the physicians, as the results were so clear cut.

No cases were considered as "modified" in which any doubt existed in the mind of the doctor as to the results. It should be noted that one of the most acid tests to which any investigation can be subjected is its use by an unselected critical group of physicians.

Not in every case was modification the objective; occasionally complete prevention was the goal. We therefore considered modification and no measles as success. Only cases of definite exposure and definite

cation could not be expected. Three of these patients were older, aged 30, 16 and 11 years, and should have received a larger dosage of immune globulin to obtain a definite modification. In none of the four cases were both the correct time of administration and the correct amount of immune globulin used. If these four cases were then thrown out of the calculation, 100 per cent success could be reported in the remaining seventy-three cases.

TABLE 4—Results of All Oral Cases

	Cases	Percentage
No effect	3	19
Modification	12	75
No measles	1	6

As modification is the object in 90 per cent of the cases, it is interesting to determine the reason for thirty-one cases in which measles did not develop. Seven of these patients were intentionally prevented from having measles by early administration of immune globulin. Allowing 10 per cent of the susceptible cases intimately exposed the privilege of not contracting the disease anyway,<sup>6</sup> we have 10 per cent of fifty-seven persons, or, roughly, six more, making a total of thirteen persons of the thirty-one who would naturally have "no measles." The remaining eighteen we feel can be accounted for partly by a "factor of exposure" hitherto not recognized (table 2). The experience of individual doctors led us early in the year to an assumption that casual exposures needed less serum administered at a later date than did intimate exposures in order to obtain modification.

The work of Karelitz and Schick published in May is in accord with our observations and substantiated our assumption. In 60 per cent of the casual exposures no measles developed while in only 10 per cent (corrected for early administration and infectious rate as previously described) of intimate exposures no measles developed. The 60 per cent of no measles in the casual group might be due to the naturally low infectious rate in casual exposures. It was the definite impression of the physicians, however, that the reduction of dosage and the delaying of administration produced more modification in the casual exposures. Our small group of figures do not substantiate this impression.

Table 3 shows definitely that the most important factor in this series is still the time of administration—the third and fourth days giving probable prevention, the fifth to the eighth day giving modification and the ninth day or later giving failure for clear-cut results.

#### GROUP II

Those receiving oral administration, 12 cc. of immune globulin in three 4 cc. doses in ice water before breakfast, numbered sixteen cases in all.

TABLE 1—Results of All Intramuscular Cases

	Cases	Percentage
No effect	4	6

Totals	20	57

history of susceptibility were included in the group in which measles did not develop. No patients under 6 months of age are included in the series.

We have divided our data into two groups.

#### GROUP I

Those receiving the usual intramuscular administration of the serum (seventy-seven cases in all) show 95 per cent success to 5 per cent failure.

It should be noted that, of the four cases of failure, in three cases immune globulin was given so late—the ninth day after exposure or later—that clear-cut modifi-

It should be noted that the one case of "no measles" in the series could be due, first, to early adequate dosage given on the third day with the purpose of prevention; secondly, to chance on the infectious rate. This was one of three casual exposures, the other two casual exposures in which immune globulin was given at a much later date after exposure obtaining modification.

Of the three patients in whom treatment failed, two were given immune globulin on the ninth day or after. Only once when both dosage and time of administration were correctly given was frank failure observed.

The results arrange themselves very much the same in tables 5 and 6 as in tables 2 and 3 of the previous group.

After intramuscular administration, slight local reaction occurred in thirty-two, or, roughly, one third of the cases. Slight febrile reaction was observed in less than one sixth of the cases. These reactions occurred in from twelve to twenty-four hours and did not last. No severe or general reaction was reported.

The significance of death rates in so small a population is not marked, but it is interesting that in 1930 in Hillsdale County six deaths from measles were recorded with only half as many cases. To date, no deaths have been reported with the largest number of cases the county has ever seen. The significance of this observation is minimized by a fall in the case fatality rate for the whole state from 0.43 in 1932 to 0.23 in the first ten months of 1935.

#### CONCLUSIONS

Although our series is not large enough to bring definite statistical proof, it seems sufficient to draw certain conclusions:

1. Immune globulin is apparently an effective and practical agent in modification and prevention of measles in the private practice of medicine.

TABLE 5—Analysis of Casual and Intimate Exposures

	Casual Cases	Intimate Cases
No effect	0	3
Modification	2	10
No measles	1	0
Totals	3	13

TABLE 6—Results by Day of Administration of Immune Globulin

Day	No Effect	Modification	No Measles
Third	0	0	1
Fourth	0	2	0
Fifth	0	2	0
Sixth	1	2	0
Seventh	0	3	0
Eighth	0	1	0
Ninth or over	2	2	0
Totals	3	12	1

2. The three chief variables are: amount of exposure, amount of immune globulin, and the time of administration. The last remains the most important single factor, but with intimate exposure in homes, an increased dosage or an earlier dosage is necessary to produce modification. In casual exposure it is wise to prolong the time before administration or lessen the amount of immune globulin to produce modification.

3. A fourth factor may be considered as age. Older patients need more immune globulin and earlier administration to produce the same results.

4. Reactions from intramuscular administration were negligible.

5. Administration by mouth deserves further trial, our few cases giving a percentage of success only slightly lower than intramuscular administration.

6. Epidemiologic research of statistical significance can be carried out by a county medical society through the cooperation of the individual members in a uniform method of procedure and careful recording of separate observations.

7. A county-wide program of measles prevention can be carried on in a manner satisfactory to the best interest of both the medical profession and the community.

8. The death rate from measles in Hillsdale County seems to have been lowered during the period of this county-wide project.

### THE VALUE OF THE PROGNOSTIC VENOM REACTION IN THROMBOCYTOPENIC PURPURA

SAMUEL M. PECK, M.D.  
NATHAN ROSENTHAL, M.D.  
AND  
LOWELL A. ERF, M.D.  
NEW YORK

This paper is a report on the value of moccasin snake venom in cases of essential thrombocytopenic purpura haemorrhagica. The present study is based on observations made on fifty patients, fourteen males and thirty-six females. It may be discussed from the following points: first, the importance of a skin reaction to an intradermal injection of moccasin snake venom as a prognostic measure in the clinical course of this disease; second, the therapeutic efficacy of the venom given subcutaneously, and, third, the use of the skin reaction as a guide for splenectomy.

All the cases studied were typical; some have been followed for as long as five years. They exhibited hemorrhagic tendencies such as purpura, ecchymoses, and bleeding from the mucous membranes. The blood picture showed the characteristic diminution of blood platelets. This was associated with a prolonged bleeding time, a positive reaction to the capillary resistance test, a positive flicker or pinch test, and an absence of clot retraction. In forty-four cases no definite etiologic factor could be determined; these may be regarded as of the idiopathic type. In six instances the ingestion of drugs seemed to be directly responsible. Other types of secondary or symptomatic thrombocytopenic purpura associated with leukemia, subacute bacterial endocarditis, nephritis, malignancy and other conditions will not be discussed.

#### THE PROGNOSTIC VENOM REACTION

The intradermal skin test known as the prognostic venom reaction consists of the injection intradermally of 0.1 cc. of 1:3,000 standardized moccasin venom, with a control of 0.1 cc. of physiologic solution of sodium chloride. The test is read in one hour. A positive reaction is manifested by capillary rupture with diffusion of blood into the tissues (figs. 1 and 2). The absence of capillary rupture constitutes a negative reaction. Diffusion of blood at the site of injection after

twelve hours is regarded as a delayed positive reaction. A positive reaction indicates the presence of a purpuric state and a close association with a thrombocytopenia. Clinical improvement is shown by a change from a positive to a negative reaction.

The immediate venom reaction was positive in all cases. The succeeding reactions varied; some patients improved clinically and developed a negative reaction with a gradual return to a normal hematologic status. Others exhibited no improvement either clinically or hematologically and maintained a positive reaction. There were all degrees of variation between these extremes. The following classification is based on our experience with the venom reaction in cases of thrombocytopenic purpura, observed at the Mount Sinai Hospital.

1. Acute cases with recovery (eight cases).
2. Acute cases with fatal termination (two cases).
3. Chronic cases with symptomatic improvement during venom therapy<sup>1</sup> (seventeen cases).
4. Chronic cases without symptomatic improvement during venom therapy (four cases).
5. Recurrent cases (two cases).

TABLE 1.—*Acute Purpura Haemorrhagica with Recovery*

Case	Sex	Age	Date	Venom Reaction	Venom Therapy	Course
1. E. K.	♀	3 yrs.	7/31/35 8/2/35	Positive Negative	None	Recovered spontaneously both symptomatically and hematologically
2. P. P.	♀	20 mos.	7/2/35 7/6/35 7/11/35	Markedly positive Less positive Negative	None	Recovered spontaneously
3. H. K.	♂	13 yrs.	3/20/35 3/22/35 3/24/35 4/16/35	Markedly positive Less positive Slightly positive Negative	Six injections; 1 cc. of 1:3,000 venom twice a week for 2 weeks	Recovered
4. M. M.	♂	40 yrs.	11/26/33 12/12/33	Positive Negative	Venom for 2 months as a precautionary measure	Recovered
5. J. S.	♀	25 yrs.	11/22/33 2/14/34	Markedly positive Negative	Eight injections; 1 cc. 1:3,000 twice a week for 4 weeks	Recovered
6. J. L.	♂	23 yrs.	7/1/35 7/20/35	Positive Negative	None	Recovered
7. R. F.	♂	2 yrs.	12/19/32 4/10/33	Positive Negative	1 cc. 1:3,000 twice weekly for 8 weeks	Recovered
8. A. P.	♂	7 yrs.	10/30/35 11/3/35 11/6/35	Positive Slightly positive Negative	0.5 cc. of 1:3,000 once weekly for 3 weeks	Recovered

#### 6. Chronic cases with splenectomy:

- (a) Responding to both venom therapy and splenectomy (three cases).
- (b) Not responding to venom therapy but responding to splenectomy (three cases).
- (c) Responding neither to venom therapy nor to splenectomy (five cases).

#### CLINICAL AND LABORATORY OBSERVATIONS

1. *Acute Purpura with Recovery* (table 1).—Eight patients, five males and three females, with ages varying from 20 months to 40 years, were under observation. The initial prognostic venom reaction observed during the active stage of the disease was strongly positive. The course of the disease varied from a few days to four months. The venom reaction gradually became less positive. The negative reaction usually occurred before the clinical signs had entirely disappeared and before the hematologic criteria had returned to normal. All the patients recovered both clinically and hematologically, showing the prognostic

value of repeated intradermal venom reactions in this type of case. The following cases are cited as typical examples:

CASE 8 (table 1).—A. P., a white boy, aged 7 years, was seen Oct. 30, 1935, when the child's mother had noticed the sudden development of diffuse ecchymoses on his body and also had found blood on his pillow. The past history was negative except that one year previously some purpuric spots had developed on the oral mucous membrane and on the chest during a mild attack of influenza. The family history was negative. The patient was normally developed and well nourished. There were ecchymoses over the shoulders and lower extremities, and a few purpuric spots on the lips and on the markedly congested gums.

Laboratory examination, October 30, revealed: hemoglobin 94 per cent; red blood cells 5,050,000; white blood cells 7,800; platelets 3,000; differential count: neutrophils (nonsegmented) 12 per cent; neutrophils (segmented) 32 per cent; eosinophils 3 per cent; lymphocytes 47 per cent; plasma cells 2 per cent; monocytes 4 per cent. Coagulation time was five minutes and bleeding time seventeen minutes; the tourniquet test and pinch test were positive; clot retraction was poor in twenty-four hours, and there was a positive reaction to the intradermal venom test.

The patient received three venom injections of 0.5 cc. each at weekly intervals. The ecchymoses began to disappear after the second venom injection, with a gradual change from a positive to a negative venom test. Clinical and hematologic recovery followed rapidly. The improvement was spontaneous. Laboratory examination, November 20, revealed: hemoglobin 82 per cent; red blood cells 4,560,000; white blood cells 8,600; platelets 140,000; differential count: neutrophils (nonsegmented) 5 per cent; neutrophils (segmented) 49 per cent; eosinophils 7 per cent; lymphocytes 31 per cent; monocytes 8 per cent. Coagulation time was five minutes, bleeding time two minutes, and the prognostic venom reaction negative.

CASE 2 (table 1).—P. P., a white girl, aged 20 months, was sent to the Mount Sinai Hospital in the latter part of June 1935 because of the development of diffuse ecchymoses and purpura. The family history was negative, likewise the past history, with the exception that three weeks before admission the child bled profusely from a pinprick. On physical examination there were many ecchymotic areas and purpuric spots over her face, body and extremities, and blood was observed on the edge of both nares. The liver was 2 cm. below the right costal margin; the spleen was just palpable; other physical appearances were normal.

Laboratory examinations, June 30, revealed: hemoglobin 60 per cent; red blood cells 3,300,000; white blood cells 14,000; platelets 30,000; differential count: neutrophils (nonsegmented) 8 per cent; neutrophils (segmented) 30 per cent; lymphocytes 50 per cent; monocytes 12 per cent; bleeding time twenty-three

1. The venom was given therapeutically in doses of 1 cc. of the 1:3,000 dilution, usually twice a week. A complete description of the technic and method of administration has been given in previous publications (Peck and Rosenthal). The venom, as supplied by the Lederle Laboratories, can be used for testing as well as for treatment.

minutes; coagulation time five minutes; tourniquet test positive; no clot retraction; pinch test positive; prognostic venom reaction strongly positive. The Wassermann reaction was negative and stools were positive for guaiac.

Clinical Course: Bleeding from the nose was readily controlled and the child improved rapidly without treatment. The first intradermal venom reaction, July 2, was markedly positive. The second reaction four days later was decidedly less positive; a favorable prognosis was made on the basis of this test. A third venom reaction, July 11, was negative. Two weeks later the purpuric and ecchymotic lesions had faded, the tourniquet test became negative, the bleeding time had decreased to six

that hemorrhagic bullae developed at the site of injection. Both patients died of anemia in spite of many transfusions. In one case there was a superimposed pneumonia.

3. *Chronic Purpura Haemorrhagica with Symptomatic Improvement During Venom Therapy* (table 2).—Seventeen patients, fourteen females and three males, were under observation. The ages varied from 4 to 70 years. The chief complaints in the majority of these individuals were epistaxes, metromenorrhagia,

16. D. S.	♂	54 yrs.	8/12/35 8/18/35 10/15/35	Markedly positive Less positive Delayed positive	2 months	Some symptomatic improvement
17. F. M.	♀	25 yrs.	10/ 9/35 10/16/35 10/22/35 10/31/35	Positive Delayed positive Delayed positive Delayed positive	2 months	Some improvement

minutes, and the platelets had risen to 150,000. The patient was observed for four months, during which period no further symptoms developed. Thus the trend of the venom reactions indicated a favorable outcome.

2. *Acute Purpura Haemorrhagica with Fatal Termination.*—This group included two patients, one male and one female, 15 years and 34 years of age. Both patients had severe purpuric manifestations as well as gross hemorrhage from all mucous membranes, including mouth, throat, intestine, kidneys and bronchi. The prognostic venom reactions were so strongly positive

bleeding gums, occasionally bloody stools and urine, ecchymoses and, rarely, cerebral hemorrhage. These chronic cases repeatedly exhibited the characteristic positive venom reaction. Venom therapy was then instituted. This was followed by symptomatic improvement in every instance. The reaction to the intradermal venom test became negative with the symptomatic improvement. Typical examples of this series follow:

CASE 1 (table 2).—C. B., a white woman, aged 31, admitted to the gynecologic clinic at the Mount Sinai Hospital in January 1934, complained of prolonged menstrual bleeding occur-

ring six weeks after delivery. She was seen again, February 10, with the same complaint. Gynecologic examination was negative.

In July 1935 the patient developed a large spleen, two finger-breadths below the costal margin, anemia and purpura. She was referred to the hematologic clinic and the following blood

Clinical Course: Venom therapy was begun August 2. The patient continued to have ecchymoses and purpuric spots from the injections until about the middle of September; after that she began to feel better. Her menses were reduced in amount and duration. Only an occasional nosebleed occurred. The black and blue spots decreased markedly in number and fre-

picture was found: hemoglobin 75 per cent; red blood cells 5,500,000; white blood cells 9,200; platelets 25,000; bleeding time ten minutes; coagulation time eight minutes, and delayed clot retraction. The venom reaction was positive and was repeatedly so August 2 and 16 and September 6. It became a delayed positive reaction September 13 and was negative October 6 and 18.

quency. A clinical response to the venom therapy occurred, evidenced by the reversal of the prognostic venom reaction, even though the blood picture did not improve.

CASE 2 (table 2).—F. O., a white woman, aged 24, appeared at the hematologic clinic June 24, 1935, with a history of black and blue spots occurring after the slightest injury. Her menses were prolonged and profuse.

Laboratory examination, June 24, revealed: hemoglobin 75 per cent; red blood cells 4,000,000; white blood cells 6,000; platelets 120,000; tourniquet test positive; bleeding time five minutes; coagulation time seven minutes; venom reaction positive. The test was repeatedly positive June 24, July 5 and 10, and negative July 15, August 16 and 18.

Clinical Course: Venom therapy was started June 28 and has been continued constantly since that time. Purpura or ecchymoses became infrequent and disappeared much more quickly than previously. The menstrual periods became moderate in amount and duration. Hematologically there was no change.

This case again illustrates the symptomatic response of a patient to venom therapy and indicates the increase of capillary resistance to hemorrhage by means of the

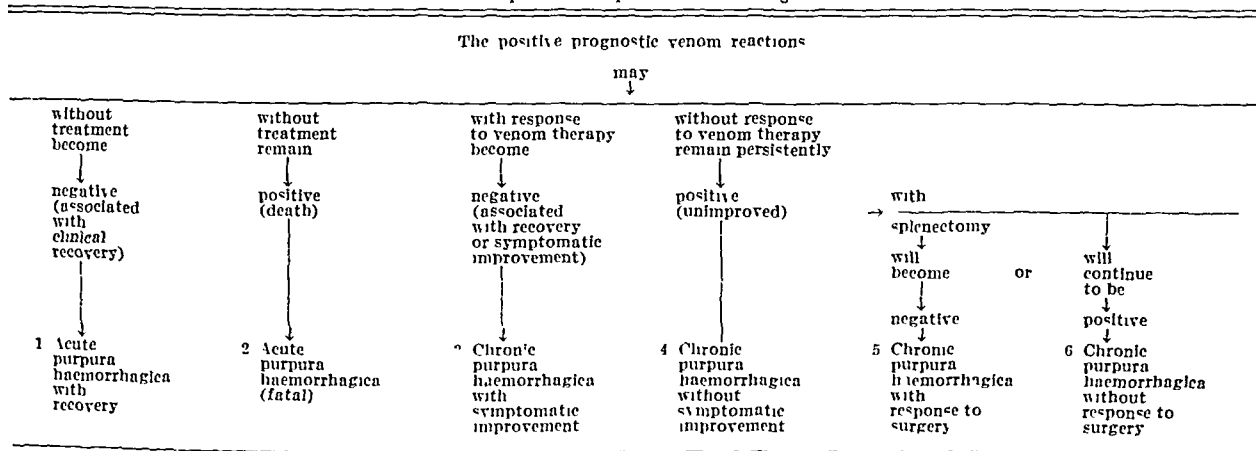

from the nose. The purpurae would appear during or following the epistaxis. The patient was normally developed and well nourished but rather pale; she sat in bed with constant oozing from the nose. Petechial spots were present on the arms, forearms and abdomen.

Laboratory examination, February 23, revealed: hemoglobin 79 per cent, red blood cells 4,650,000; white blood cells 6,400; platelets 20,000; differential count: neutrophils (nonsegmented) 29 per cent; neutrophils (segmented) 49 per cent; eosinophils 2 per cent; lymphocytes 42 per cent; monocytes 5 per cent. The tourniquet test was positive, bleeding time was ten minutes and coagulation time was five minutes; there was no clot retraction, and the prognostic venom reaction was positive.

Clinical Course. The venom test was consistently and markedly positive on several occasions. Because of this and of the

TABLE 6.—*Diagrammatic Summary. The Prognostic Value of Repeated Intradermal Venom Reactions in Idiopathic Purpura Haemorrhagica*

prognostic venom reaction. Blood taken from this patient August 14 did not contain enough antivenins to neutralize the hemorrhagic action of the titrated venom in a susceptible patient.

CASE 9 (table 2)—I. E., a white woman, aged 46, complained of persistent epistaxis and purpura on admission. Twenty-three years before the patient had a right oophorectomy and two and one-half years before a hysterectomy was performed, following which epistaxis and purpura developed. These symptoms gradually became more severe. Local measures to the nose and transfusions on two occasions were of no avail. For six months before admission to the hospital severe epistaxis occurred every ten to fourteen days with daily oozing of blood

clinical symptoms, venom therapy was instituted. Following several of these injections the epistaxis subsided and there was clinical improvement. The venom reaction became negative one month after the institution of venom therapy. Symptomatically improvement was evident, but no hematologic changes occurred. At no time during the past ten months have the platelets numbered over 40,000. The patient now maintains a constantly negative venom reaction and there is continued clinical improvement with weekly venom injections.

4. *Chronic Purpura Haemorrhagica Without Symptomatic Improvement During Venom Therapy* (table 3).—The four patients in this group, one male and three females, varying in age between 3 years and 48 years,

are examples of chronic thrombocytopenic purpura haemorrhagica that remained refractory to venom therapy. Splenectomy was refused. Repeated prognostic venom reactions were always positive over periods varying from six to sixteen months. These cases will be carefully followed as controls for the splenectomized group.

5. *Recurrent Purpura Haemorrhagica*.—Two patients, both women, aged 32 and 38, had episodes of purpura with all the typical hematologic changes and then completely recovered clinically with a return of normal blood counts. The prognostic venom reaction was positive at the beginning of each recurrence and paralleled the clinical symptoms. These patients received venom therapy during exacerbations of the disease and apparently improved with its use. A typical example follows:

R. P., a white woman, aged 31, has been under observation for five years. The first observed attack of purpura haemorrhagica occurred in 1930. The initial intradermal venom reaction at that time was strongly positive. All the therapeutic venom injections administered during 1930 were given by the intradermal route. She received these injections for one year and showed gradual clinical and hematologic recovery. The patient remained in excellent health for two years and in 1933 became pregnant, with a recurrence of the purpura haemorrhagica. She was advised to have her pregnancy interrupted but refused, and venom therapy was again instituted. Clinical symptoms were well controlled by venom during her pregnancy. The spleen was not palpable, and laboratory examination during the first part of her pregnancy before venom therapy was instituted again revealed platelets 70,000; bleeding time five minutes; clot retraction poor; tourniquet test positive. Venom therapy was continued until the end of her pregnancy. A short time before term the patient improved hematologically and delivered a normal male child.

She remained well until 1935, when she had another recurrence. August 2 the prognostic venom reaction was markedly positive. With resumption of venom therapy clinical improvement occurred, her menstrual periods becoming less prolonged, and the ecchymotic spots gradually disappeared. A prognostic venom reaction September 6 was negative.

The patient then became irregular in her attendance at the clinic and purpuric symptoms again returned, so that on October 4 the prognostic venom reaction was again positive. The injection of larger doses of venom was followed by rapid improvement. The venom reaction on October 20 was again negative.

6. *Chronic Purpura Haemorrhagica (Splenectomies and Splenic Artery Ligations)* (table 4).—The importance of the prognostic venom reaction was most evident in this particular group. Eleven cases were observed. The ages varied from 4½ to 56 years. In this group seven females and two males were splenectomized. In addition there was one female who had splenic artery ligation and another female who had splenic artery ligation followed by splenectomy.

By means of the prognostic venom reaction they could be classified as follows:

- (a) Responding to venom therapy and splenectomy.
- (b) Not responding to venom therapy but to splenectomy.
- (c) Not responding to venom therapy or to splenectomy.

Splenectomy is definitely indicated when patients fail to respond to intensive treatment with snake venom and continue to give a positive intracutaneous venom reaction. The operation may prove beneficial in some of these cases. The postoperative progress of such cases can be accurately predicted by the immediate venom test. A negative reaction after operation has a good prognostic import. In fact, this may precede any noticeable symptomatic or hematologic improvement.

However, persistence of a positive venom reaction after splenectomy indicates that the operation will not prove beneficial to the patient.

Splenectomy can also be offered as an alternative measure to patients manifesting a clinical response to venom therapeutically but who object to a future of continued venom injections. Such patients in our small series experienced both symptomatic and hematologic improvement from the operation.

(a) Typical cases responding to both venom and splenectomy follow:

CASE 2 (table 4).—E. L., a white woman, aged 21, entering the Mount Sinai Hospital, March 1, 1933, complained chiefly of metrorrhagia and purpuric manifestations over a period of seven months. The past and the family history were both negative. During November and January preceding the patient's admission, the menorrhagia was controlled by snake venom therapy. The patient decided to have her spleen removed in order to avoid continuous injections of venom.

Laboratory examination at that time revealed: hemoglobin 67 per cent; red blood cells 3,600,000; white blood cells 4,500; platelets 50,000; differential count: neutrophils (nonsegmented) 7 per cent; neutrophils (segmented) 49 per cent; eosinophils 1 per cent; lymphocytes 41 per cent; monocytes 2 per cent. Bleeding time was six minutes; coagulation time ten minutes; tourniquet test positive; no clot retraction, and a positive prognostic venom reaction. A spleen about twice normal size was removed on March 14. The patient had an uneventful post-operative course and has remained well since. Platelets rose to 500,000 following splenectomy and then gradually returned to normal.

CASE 3 (table 4).—B. W., a white girl, aged 12 years, entering the Mount Sinai Hospital, Sept. 11, 1935, complained chiefly of severe menstrual bleeding. The first menstrual episode was so severe that a transfusion was required. Examination of the blood at that time revealed hemoglobin 60 per cent; red blood cells 3,910,000; white blood cells 9,150; platelets 16,000; differential count: neutrophils (segmented) 47 per cent; eosinophils 10 per cent; lymphocytes 35 per cent; monocytes 5 per cent; reticulocytes 4 per cent; coagulation time thirteen minutes; bleeding time eighteen minutes; positive tourniquet test, and a positive pinch test and prognostic venom reaction. The menorrhagia stopped and the patient was discharged, September 19. Snake venom therapy was then instituted and given twice a week. The second menstrual period was normal. Since the prognostic venom reaction became negative the venom therapy was reduced to one injection of 1 cc. once a week. The third menstrual period was profuse and nosebleeds and bloody stools developed, and she was again hospitalized, December 22. The blood studies were nearly identical with those during the first admission. The prognostic venom reaction was markedly positive again.

The physical examination was negative. Because of the recurrence of bleeding symptoms a splenectomy was advised, since the patient refused further venom therapy. Splenectomy was performed, December 24. December 26 the platelet count was 460,000; December 27, 830,000; December 28, 1,250,000; Jan. 2, 1936; 1,200,000; January 3, 700,000, and January 6, 410,000. Except for a slight bronchopneumonia there was an uneventful recovery.

On the morning of the operation the prognostic venom reaction was positive, and three hours after splenectomy the venom test was negative. At this time the tourniquet test was still positive and there was no hematologic improvement.

(b) The following is a typical example of a case not responding to venom therapy but to splenectomy:

CASE 4 (table 4).—A. R., a white woman, aged 56, entered Mount Sinai Hospital, May 6, 1935, with a history of having had purpura haemorrhagica for twenty-one years. Her chief complaints on admission were marked hematemesis, bloody diarrhea, pallor, marked weakness, palpitation and dyspnea. The family history and past history were negative. Twenty-two years previously, because of marked metrorrhagia, the patient

was curetted without improvement. Nineteen years prior to admission the patient had a hysterectomy. Since then the patient had frequent bleeding from all orifices and had been practically an invalid. Because of a recent severe loss of blood, the patient came to the hospital for a series of transfusions. As she did not respond favorably to venom therapy a splenectomy was advised. The patient was well developed but extremely pale, with generalized purpura and ecchymoses. The gums were markedly spongy, infected and bleeding. The spleen and liver were not felt.

Laboratory examination on admission revealed: hemoglobin 24 per cent; red blood cells 2,100,000; white blood cells 8,300; platelets 30,000; neutrophils 68 per cent; lymphocytes 22 per cent; monocytes 10 per cent; bleeding time eleven minutes; coagulation time eight minutes; tourniquet test positive; no clot retraction; prognostic venom reaction positive. The patient was given three transfusions before a splenectomy was done and withstood the operation well. The postoperative course was uneventful except for the aspiration of 500 cc. of sanguineous fluid from the left pleural cavity. Following the splenectomy the platelets never rose above 60,000 during her stay at the hospital. The venom test became negative the day after operation, and she has maintained a negative test ever since. The patient has been observed for ten months since she left the hospital. Blood studies at the end of the ten months' period showed a negative tourniquet test, a bleeding time of three minutes, and 150,000 platelets. She is no longer an invalid, being able to do her housework for the first time in twenty-two years.

(c) The following case is a typical example of a patient responding neither to venom therapy nor to splenectomy:

CASE 7 (table 4).—J. M., a white girl, aged 4½ years, admitted to Mount Sinai Hospital, July 1, 1933, complained of nosebleeds and ecchymoses for a period of eighteen months. The family history was negative; the past history revealed that since birth the patient had developed large ecchymoses from slight trauma. Sixteen months before admission she had a tonsillectomy and lost a great amount of blood. Since then she had had constant oozing from the mouth, this being associated with tarry stools. The child was admitted to the hospital for a splenectomy, because she was refractory to venom therapy. She was well nourished. There was a generalized purpuric eruption, including the pharyngeal mucous membranes.

Laboratory examination on admission revealed: hemoglobin 45 per cent; red blood cells 2,260,000; white blood cells 43,000; platelets 40,000; differential count: neutrophils (nonsegmented) 3 per cent; neutrophils (segmented) 30 per cent; lymphocytes 66 per cent; monocytes 1 per cent; bleeding time twelve minutes; coagulation time six minutes; tourniquet test positive; no clot retraction; venom test positive. A small spleen and a very small accessory spleen were removed. The postoperative course was attended by several complications: a small hematoma immediately appeared at the lower angle of the wound, blood oozed from the gums and mouth, and a large ecchymotic area appeared on the thigh. Three weeks later gross hematuria occurred and persisted for several days, associated with a rise in temperature to 103 F. This complication gradually subsided and the patient left the hospital eight weeks later without noticeable bleeding tendencies. This case has been followed for more than two years. Clinically the patient has made only slight improvement. She still bleeds from the mouth and gums occasionally and she still gets ecchymoses on trauma. Her prolonged bleeding time is maintained and the platelets have never gone above 50,000 since the splenectomy. The venom test has always been positive, and the patient is still refractory to venom therapy.

**7. Thrombocytopenic Purpura Haemorrhagica Due to Drugs** (table 5).—There are many drugs which may cause thrombocytopenic purpura haemorrhagica, such as neosarphenamine, arsenic, quinine, chrysarobin, benzene, allyl-isopropyl-acetyl-carbamide and gold. The six cases in this group were selected to show that prog-

nostic venom reactions may be a guide for determining the immediate prognosis of a drug purpura. Four of the cases occurred in females and two in males. All the patients were over 35 years of age and they all presented a picture of acute purpura haemorrhagica. Recovery was remarkably rapid when the offending drug was withdrawn. It is of interest to note that case 5 presented a striking specificity of this idiosyncrasy to chrysarobin, as the purpura recurred every time the chrysarobin was applied for psoriasis. Because of the chronic course this patient was treated with venom for a short period. Prognostic venom reactions were always positive during the active manifestations of the syndrome in all these patients. A typical example follows:

CASE 1 (table 5).—E. D., a white woman, aged 63, admitted to the Mount Sinai Hospital Oct. 1, 1935, complained of diffuse ecchymoses and bleeding from the nose, gums and bladder. The family history was negative, and the past history was

Fig. 1 (case 8, table 1).—Positive venom test within thirty minutes after intradermal injection of one unit of moccasin venom in 7 year old boy with acute thrombocytopenic purpura

negative except for ingestion of a proprietary preparation containing allyl-isopropyl-acetyl-carbamide. The patient had been taking this drug for a month previous to admission because of restlessness due to the death of her husband. She had been in her usual state of health until fourteen days previous to admission, when she noticed the development of a number of bruises. She began to bleed from the nose, then the gums, and when blood appeared in the urine she became frightened and came to the hospital. Physical examination was negative except for diffuse purpura, ecchymoses and petechiae scattered in the mucous membranes and in the skin over the entire body.

Laboratory examination, October 3, revealed: hemoglobin 76 per cent; red blood cells 5,000,000; white blood cells 20,000; platelets 20,000; differential count: neutrophils (nonsegmented) 16 per cent; neutrophils (segmented) 62 per cent; basophils 1 per cent; lymphocytes 18 per cent; monocytes 3 per cent. Bleeding time was twenty minutes, the tourniquet test was positive, there was no clot retraction, and the venom test was positive. October 6 the venom reaction to this test was less positive, and it was negative on October 9. The laboratory results, October 9, were hemoglobin 65 per cent; red blood cells 3,700,000; white blood cells 13,500; platelets 260,000;

differential count: neutrophils (nonsegmented) 3 per cent; neutrophils (segmented) 71 per cent; basophils 1 per cent; lymphocytes 18 per cent; monocytes 7 per cent.

## COMMENT

Snake venom did not find a place in rational therapeutics until recently. Rattlesnake venom had previously been advocated in epilepsy, but its value is questionable.<sup>1a</sup> Homeopathy has long included<sup>2</sup> the venom of the Crotalinae (*Lachesis*) in its pharmacopeia for various types of bleeding; it is given orally in homeopathic doses, and experimental evidence seems to indicate that it is easily destroyed by the digestive juices. More recently Monaelesser<sup>3</sup> and others have advocated cobra venom by injection for the control of intractable pain in carcinoma. It has been found that the venom of the Russell viper,<sup>4</sup> the tiger snake,<sup>5</sup> and

as nasal and uterine, and conditions such as Osler's disease and various types of purpura haemorrhagica.<sup>7</sup> The use of moccasin venom in the treatment of hemorrhage was suggested by the observation that certain venoms are capable of producing a refractory state to experimental purpura, known as the Schwartzman phenomenon.<sup>8</sup> This observation led Peck to use the intradermal injection of moccasin venom as a measure of gaging capillary resistance.

Because of the vast difference in the amounts of neurotoxins, hemolysins and hemorrhagins of various venoms and even of the same venom, Witebsky, Peck and Neter<sup>9</sup> devised a means of standardizing the hemorrhagin content of moccasin venom by using the chick embryo. The most reliable standardization for therapeutic use is clinical trial in suitable cases. However, a standardized moccasin venom, if kept in the ice-box, will retain its hemorrhagin content for a number of months.

Standardized venom, when given intradermally, will cause the development of an ecchymotic area in untreated thrombocytopenic purpura haemorrhagica without close relationship to the platelet count. It is well known that the initial symptoms of this disease may appear when the platelets number 5,000 or as high as 100,000. The severity of the disease does not depend on the number of platelets—the so-called threshold value—but more likely on the fundamental principles, such as a functional qualitative capacity of the megalokaryocytes and platelets, and the integrity of the capillaries.

A positive reaction to the venom test may consist of a small capillary rupture only 0.5 cm. in diameter, or it may involve the skin far beyond the injection site. A delayed reaction is a diffuse ecchymosis developing twelve hours or more after injection. This type of reaction is not reliable for diagnostic or prognostic purposes, since some apparently healthy individuals give such a reaction. The negative test shows no hemorrhagic reaction.

One must not depend on a single reaction for prognosis; a single test is an indication of a purpuric state or the existence of a local or generalized capillary fragility. The importance of the test prognostically lies in observing successive injections. Thus, one can observe the persistence and increase of a positive reaction, or the reversal of a positive to a negative reaction, and note the trend of the disease. This is possible because it has been determined that not enough antivenins are formed in the circulating blood to influence the test.

A reversal of a positive reaction to a negative foretells recovery or improvement. This occurred in eight cases of thrombocytopenic purpura haemorrhagica, and in five cases of purpura due to drugs. In two patients with purpura haemorrhagica with fatal termination the prognostic venom reaction was repeatedly intensely

Fig. 2 (case 8, table 4)—R. LaC., a woman, aged 35, with chronic thrombocytopenic purpura, not responding to splenectomy or to venom therapy. A positive venom test one hour after the injection of one unit of moccasin venom intradermally.

*Bothrops atrox*<sup>6</sup> hasten the coagulation of blood in vitro, and they have been recommended for local hemostasis.

Moccasin venom, which we have used in the present study, has earned for itself an important place in modern therapeutics. Its parenteral use has proved to be of definite benefit in various types of bleeding such

positive. Thirty-four chronic cases were observed. All these chronic cases had been subjected to subcutaneous venom therapy in adequate dosage (the minimum amount given was 1 cc. of the 1:3,000 standardized moccasin venom given twice a week). The twenty-two patients with a reversal from a positive to a negative reaction in this group (64 per cent) all showed clinical improvement with the venom therapy. However, hematologic improvement did not parallel the symptomatic improvement in such treated cases.

The interval between injections was increased in some of these patients in an effort to determine the minimum maintenance dosage. Occasionally venom injections were discontinued for several months, with the result that the effect of the treatment gradually diminished. This was usually followed by a recurrence of symptoms and a reappearance of a positive reaction to the venom test. Thus, the test indicated the need for the resumption of therapy or more frequent injections.

The patients who were refractory to subcutaneous venom therapy were advised to have a splenectomy. Eleven cases in which splenectomy had been done were studied. Splenectomy was done in three cases that had responded to subcutaneous injections of venom and presented a reversal of the venom test. Recovery occurred in these cases both clinically and hematologically following the operation.

The observation of intracutaneous venom tests and of cases treated with venom proved to be of great importance in cases which demanded more radical treatment, such as splenectomy. Three patients who had responded favorably to subcutaneous injections of venom and had a reversal of the venom test were splenectomized. They recovered both clinically and hematologically following the operation.

Patients who were refractory to subcutaneous venom therapy and showed a persistently positive venom reaction were advised to have splenectomy. Eight patients in this category were splenectomized. Clinical and hematologic recovery occurred in one case. There was symptomatic recovery in two cases and in all three cases there was a reversal of the positive venom test to negative following the operation.

In three cases splenectomy failed to control the purpuric condition. In each case the venom reaction continued to be positive and death followed shortly after the operation.

Although there was postoperative recovery in the tenth case, purpuric manifestations continued and the patient failed to respond to continued venom therapy. The intracutaneous venom reaction also remained positive. In the eleventh case splenectomy was performed several years ago, prior to the use of venom for therapeutic purposes. Clinically the operation proved unsuccessful. This patient continues to have positive venom reactions.

In the treatment of purpura haemorrhagica it is of great importance to test and treat the patient with snake venom, either for the control of the condition or to predict the outcome after splenectomy.

#### SUMMARY

1. An intradermal moccasin snake venom test has been used as a prognostic measure in essential thrombocytopenic purpura haemorrhagica.

2. Persistence of a positive reaction to successive tests, or a reversal to a negative reaction, is of value in determining the trend of the purpuric state.

3. Subcutaneous injections of moccasin snake venom have been employed as a therapeutic measure in chronic purpura haemorrhagica. It apparently has been of value in twenty-two of the thirty-four cases in which it has been used.

4. The effect of subcutaneous venom injections and the trend of the intracutaneous venom test are important for the indication and prognosis of splenectomy.

## THE INJECTION TREATMENT OF REDUCIBLE HERNIA

W. M. McMILLAN, M.D.

CHICAGO  
AND

D. R. CUNNINGHAM, M.D.

EVANSTON, ILL.

The high incidence of recurrence<sup>1</sup> still found in surgical treatment of hernia led us to investigate the injection method. This method has fallen into disrepute, largely because of the widespread use of proprietary nostrums of uncertain content. There is, nevertheless, a sufficient amount of evidence concerning the possible action of some substances to warrant further investigation.

#### HISTORICAL

Apparently Velpeau of Paris<sup>2</sup> must be given the credit for being the first surgeon to use irritants with the intention of producing a proliferation of new connective tissue to obliterate the inguinal canal. Sometime after 1844 Pancoast<sup>3</sup> reported to the profession his results in thirteen cases of hernia in which he used a cannula through which he introduced iodine and in other cases tincture of cantharides into the inguinal canal. In 1842 Heaton<sup>4</sup> in Boston had used tincture of iodine, using a crude type of instrument, and published a report on his method in 1843. Owing to an unfortunate controversy with the medical profession at that time his work did not receive much attention in this country, and it was not until the year 1877 that he published a book in which he described his treatment. Before that time he had been given a warm reception in Europe, and his work was accepted as a real contribution to surgical advance. This probably explains why the injection method first gained so many adherents in Europe. From the time of Heaton's publication (1877), the flow of literature on hernia non-operatively corrected began to swell perceptibly, notably in the writings of Schwalbe,<sup>5</sup> Janney,<sup>6</sup> Warren,<sup>7</sup> Lannelongue<sup>8</sup> and Ripley.<sup>9</sup> In 1927 Mayer<sup>10</sup> of Detroit published his reports covering twenty-eight years of experience with the use of zinc acetate solu-

tion. This work incited new interest in the subject, since he declared himself as having less than a 2 per cent recurrence, and it was not long before others began adding their experiences to the literature on the subject. The more recent work of such men as Wyss,<sup>11</sup> Hall,<sup>12</sup> Wollermann,<sup>13</sup> Jameson,<sup>14</sup> Wolfe,<sup>15</sup> Bratrud,<sup>16</sup> Rice,<sup>17</sup> Quillin<sup>18</sup> and Fowler<sup>19</sup> has given a new impetus to further clinical and experimental research.

Fig. 1.—Section from tissue one week after injection with solution C, showing proliferating fibroblasts and remnants of lymphocytic infiltration under high power (X 390).

The work reported here was begun in March 1934. At the same time an opportunity was afforded in the experimental surgical laboratory to determine the value of the use of various irritant solutions in the inguinal canal, in the hope of developing solutions that were felt to be most effective in stimulating the production of connective tissue of a permanent nature, without necrosis or abscess formation.

#### EXPERIMENTAL

With the use of dogs we first attempted to see what results would occur when different irritants that we planned to use clinically were injected into the general circulation. Both blood pressure and respiratory graphs were made. These graphs showed that a decided drop in blood pressure occurred at first, followed by a compensatory increase, the normal blood pressure being regained after about thirty to forty minutes. The respiratory rate was accelerated, sometimes as high as 40 per minute. In no case did the animal die. For these tests we used strengths of solutions sometimes as great as twice that which we planned

to use clinically. We then proceeded to study the tissue changes that occur when irritants are injected into muscle and fascia of the inguinal canals of dogs.

Microscopic study made of stained sections of tissue showed that as early as eight hours after an injection of a solution containing 50 per cent phenol in alcohol, in a dosage of from 3 to 10 minims (0.2 to 0.6 cc.) there is a marked exudation of polymorphonuclear and round cells. At one week a section taken from the same area showed many histiocytes. Fine fibroblasts began to make their appearance (fig. 1). Tissue sections studied microscopically, taken from an area that had been injected two weeks previously, showed dense bundles of fibrous tissue. This fibrous tissue becomes more dense in sections studied after longer intervals (from two to four weeks) and becomes adult, mature connective tissue after from six to eight weeks (figs. 2, 3 and 4). These results are similar to those described by Rice,<sup>17</sup> who had used the same irritant. We also found evidence of fat decomposition in the presence of macrophages filled with lipoid granules and the presence of foreign body giant cells. The latter was more constantly found in tissue sections that had been injected with tannic acid. Our experimental work indicates that no matter which of these irritants are used (i. e., alcohol, iodine, tannic acid or phenol, in proportional strength), the same relative reaction occurs, and we feel that permanent fibrous tissue is not developed any more by one irritant than by another. That "layers" of connective tissue can be produced in the inguinal canal after irritants are injected at intervals of two to three days is well demonstrated in our microscopic studies (fig. 3). Old fibrous tissue superimposed on round cell infiltration and new fibroblasts demonstrated to us the possibility of slough of mature connective tissue when the irritant is given in too large doses or given too frequently. We have also noted the absorp-

Fig. 2.—Granulation tissue and maturing fibrous scar after two weeks with solution C under low power (X 115).

tion of a hard fibrotic induration in the inguinal canal of the dog, occurring as late as six months after all irritants had been discontinued.

#### CLINICAL PROCEDURE

Three different solutions labeled solutions A, B and C were used. Solution A contained tannic acid 0.25 Gm., benzyl alcohol 3 cc., thymol 0.5 Gm., grain alcohol

100 cc., tincture of thuja 4 cc. Solution B contained tannic acid 0.5 Gm., benzyl alcohol 3 cc., thymol 0.5 Gm., and grain alcohol 100 cc. Solution C contained phenol 15 cc., alcohol 7.5 cc., tincture of thuja 7.5 cc. Solutions A and B were given in 5 cc. doses biweekly and solution C was given in doses ranging from 4 to 8 minims (0.26 to 0.52 cc.). The introduction of the irritants in these large doses directly within the peritoneal cavity of the dog was painful for approximately one hour, but no deaths occurred. In sections of the peritoneum removed after from four to five days we noted areas of necrosis with beginning healing. Apparently the exudation produced about the irritant by the peritoneum produces enough protection to limit any extended amount of necrosis of the tissues. We noted no embolic phenomena in any of the animals after numerous injections within both the inguinal canal and the abdominal cavity.

#### CLINICAL HAZARDS

In the review of the literature dealing with the subject of injection treatment of hernia one may gain the impression that the method is practically without complications or hazards. We do not feel that such an impression should go unchallenged. The publication of Goldhahn<sup>20</sup> and his reference therein to the evils of the widespread and unlimited use of injections in all types of cases must make an impression on any one who feels that the method is worth while. But it appears that the cases cited (Goldhahn) must have been complicated by abdominal viscera present within the canal before the injections were made. He does not state whether any truss was used. In other words, either the hernia was not reduced beforehand or the operator failed to recognize an unreduced hernia. The latter problem can more often than not occur. The possibility of forming adhesions within the peritoneal cavity with severe irritants, once the sac has been punctured, may be safely dismissed. Our work in dogs has given us ample proof that such an irritant in small amounts is practically always absorbed. Transfixing the spermatic cord must be considered when one is not absolutely sure of the position of the needle. One of us has seen this done on a patient outside our clinic. The result was severe swelling and pain in the testicle, associated with cramps in the lower part of the abdomen, which lasted for several days and then gradually subsided.

#### SELECTION OF CASES

The series of cases here presented was selected in the following manner: Hernias associated with undescended testicle, sliding hernias and irreducible hernias were ruled out. No attempt was made to treat patients suffering from the following conditions involving the general health: marked obesity, hemophilia, syphilis, neurosis, toxic goiter; patients suffering from chronic severe coughs, and obviously all cases requiring surgery for the associated conditions, such as abdominal tumors, enlarged prostate, large varicocele or hydrocele. It was also a rule that no patient was treated who was previously not relieved of all symptoms by wearing a truss. All patients were carefully examined and the size of the defect in the abdominal wall was noted, as well as the size of the hernia. Also any atrophy of either testicle was carefully noted. The latter was carefully carried

out because critics of this treatment have stated at times that the method was prone to produce testicular atrophy. In our series we found that about 8 per cent of our patients suffered from this condition. It is imperative that a truss be worn from one to two weeks before treatment is started, first, to prevent the treatment being interrupted by local irritation of the skin, and, secondly, to make sure that the hernia can be held reduced at all times. After considerable experimentation with different types of trusses it was found that the spring type with anterior and posterior pressure was the most efficient. This applied to all types of hernia except the umbilical, in which it was necessary to use the circular type to maintain the pad in its proper position. The proper fitting of the truss and its proper adjustment from time to time is one of the most important prerequisites to this treatment. In those cases in which difficulty was experienced in curing the hernia it was invariably found that the truss was at fault in not holding the hernia continuously reduced.

Fig. 3.—High power field of area of injection after three weeks; maturing fibrocytes and remnants of lymphocytic infiltration.

The truss was worn day and night for from one to two weeks before treatment was started and for a varying period after treatment was instituted of from two to four weeks. The truss was then removed only at night. It was then worn during the day until we were satisfied that the hernia was cured. It is far better to wear the truss unnecessarily long than to remove it too early. The patients were instructed to carry on their normal activities while under treatment, many of them doing heavy work, but were cautioned to be sure that the pad was in proper position at all times.

The solutions used in this series were those referred to as solutions B and C. The dosages used were: solution B, from 1 to 3 cc.; solution C, from 4 to 8 minims. With the former solution a preliminary injection of 1 cc. of a 2 per cent procaine hydrochloride solution was first introduced. Then, after a few moments, the needle, which was left in situ, was attached to the syringe and the solution was slowly injected. This technic eliminates any pain. The minimum dosage of both solutions was used in umbilical,

20. Goldhahn, Richard. Ueber schwere Schädigungen nach Bruchbehandlung mittels Alkoholinjektionen. *Klin. Wchnschr.* 9: 1447 (Aug. 2), 1908 (Oct. 18) 1930; 10: 72 (Jan 10) 1931.

femoral and incisional hernias as well as about the internal ring in inguinal hernia. The larger dose was used about the external ring and Hesselbach's triangle in a direct inguinal hernia. For solution B an ordinary 5 cc. syringe was used, while with solution C an ordinary tuberculin syringe was found most satisfactory. A 22 gage needle, preferably with the security anesthesia guard to prevent possible breaking of the needle within the abdomen, was employed.

#### TECHNIC

The injection was carried out in the following manner: The patient was placed in the supine position and the truss was removed and replaced, unassisted, by the patient. The skin was prepared by washing with 40 per cent alcohol, and, after careful examination to make certain that the hernia was reduced, the solution was injected slowly and firm pressure was exerted thereafter for a few minutes. The syringe must be aspirated before the injection is made to make sure that one is not in a blood vessel. It was found that the

Fig. 4.—Mature connective tissue eight weeks after injection with solution C under low power ( $\times 115$ ).

greater number of our cases were of the inguinal type and therefore the technic will be given in some detail. The following landmarks must be noted: the anterior superior spine, the pubic spine, and a point located just above the midpoint on a line drawn between these two landmarks. The last mentioned represents the position of the internal ring. All injections were made along the entire course of the canal regardless of the type of hernia, because it was noted in some of our cases that when an apparently direct inguinal hernia was treated and the external ring was completely closed subsequent weakness developed about the internal ring and vice versa, so the area through which the hernia protruded was treated first and the remainder of the canal subsequently. It might be added that in the case of direct inguinal hernia the solution was deposited also within Hesselbach's triangle and along the conjoint tendon. In this case the solution was introduced mesial and posterior to the cord. A distinct "give" sensation is experienced as the needle goes through the fascia. When injecting about the external ring it is obviously easier to do this under the direct guidance of the finger,

which is gently inserted therein. In the case of the internal ring one is aware that the point of the needle has entered this area by the fact that, following its introduction, the body of the needle may be moved freely in any direction. In addition to this fact, as a rule, the patient will complain of slight pain along the cord or in the testicle on the side that is being injected. In the case of femoral hernia, the point of the needle is placed in the femoral canal mesial to the surgeon's finger, which is previously placed therein. This, obviously, is necessitated by the proximity of the femoral vessels and nerves. In incisional and umbilical hernia, care was used to deposit the solution directly into the fascia with the hernia well reduced to prevent any injury to a viscus.

In our series of cases we found that the average number of injections required were from eight to twelve, which were given once or twice a week, depending on the reaction. In a very few cases four or five injections seemed to give a firm closure, and in a few cases as high as twenty-four injections were necessary. It was our custom not to remove the truss at night until the whole area seemed firmly closed, and the patient was not allowed to remove the truss permanently until the entire area through which the hernia had presented itself was firm and no impulse could be elicited when the patient coughed in an erect standing position. This last test was not made until we were quite certain that a good closure had been accomplished. All patients were advised to return for a check up three times yearly, to avoid constipation, and to replace the truss if suffering from any unusual or prolonged coughing spells.

Apparent clinical cure has resulted in as few as four injections, but we are quite aware of some absorption of the fibrous tissue, as proved by subsequent check ups in treated cases. The ideal end result of this treatment is the development of a permanent firm closure with fibrous tissue. It is therefore necessary to check these cases after discharge at monthly intervals for six months.

A summary of our cases shows that 350 cases were examined, of which 308 were found suitable for treatment. One hundred and seventy patients are now under active treatment and 138 have been discharged as completely cured. The remaining forty-two patients failed to cooperate. The age range was from 11 to 90 years. It is our custom to have all patients return for a check up about three times yearly. Our recurrent rate in all types of hernia treated has, to date, been 8 per cent. By recurrences we designate as such any with a definite impulse, even though the hernia of its original size has not returned. It might be further stated that when recurrences do result the hernia is invariably much smaller than the original one.

#### COMPLICATIONS

The obvious need for the truss to remain in one position, with steady pressure over the point of exit, led to superficial skin necrosis in ten cases, or 3 per cent. During the healing of these lesions no injections were given, nor was the pressure of the truss relaxed. The areas usually were washed with tincture of green soap and water, then thoroughly shaved, and a dusting powder used before the truss was reapplied. All such lesions healed without difficulty in from ten to twenty days. In twelve of our cases (4 per cent) swelling developed in the cord, associated with tenderness in the testicle; usually such swelling was transient and sub-

sided without special treatment. The question of sterility resulting in such cases has been previously raised.<sup>21</sup> However, we were struck with the high incidence (8 per cent in our series) of extreme or partial atrophy of the testicle, associated with hernia, before any treatment was started. We are inclined to believe that some sterility occurs in untreated cases as well as after surgery and this procedure. No authentic data on this feature have been presented as yet. To date none of our patients have complained of impotence. However, in an endeavor to investigate more thoroughly this (potential) possibility, we intend to check on specimens of semen from patients treated for bilateral hernias. In the total number of injections given in this series of cases only two reactions occurred, in which, we confidently feel, the irritant entered the sac and found its way into the general peritoneal cavity. Both patients complained of severe abdominal pain and weakness. On examination both patients had a weak pulse, a cold sweat and an anxious look, simulating a condition of shock. No special treatment was instituted and all symptoms disappeared after about one hour. Both patients left the clinic after two hours unaided. The possibility of injecting a strong irritant into the contents of an unreduced hernia will always remain a potential hazard with those wishing to employ this technic in the treatment of hernia. Our own experience, and the experience of other writers on the subject, makes us feel that this possibility is not great if due care is used. Nevertheless, we wish again to stress the importance of thoroughly examining the canal before any irritant is introduced into it.

#### CONCLUSIONS

These results indicate that the injection treatment of hernia in selected cases, and with the preparations here employed, carried out with careful attention to technic, has a definite place in the management of hernia. It does not seem in the light of our experience and results reported here that the hazards are greater than those from other forms of treatment. The recurrences following this treatment seem to be considerably less than after surgery. The duration of observation, however, is too short for certain opinion on this problem. When recurrences do result, the further treatment necessary to effect a cure is considerably less than the complete new procedure required by surgery. The injection treatment should be looked on as an aid in attacking the problem of hernia, and it is not our belief that it will supplant surgery more than by eliminating the necessity for operation in certain types of cases.

**Banishing Certain Foods.**—One cannot get the best results by simply trying to avoid fattening foods, for practically every food is more or less fattening when eaten in addition to a dietary already sufficiently rich in calories. The intelligent procedure is not to banish any food simply because of its calories or its reputed fattening power, but to consider the food also with reference to its mineral elements and vitamins. Milk and potatoes are so valuable in these respects that the former should be, and the latter well may be, retained in even a rigorously reducing diet: banish rather such things as sweets and pastries, which are much more concentratedly fattening and have almost no vitamin value. "No calories without vitamins" may serve as a reminder.—Sherman, H. C.: Food and Health, New York, Macmillan Company, 1934.

## REVERSIBLE CARDIAC ENLARGEMENT

JOHN E. WALKER, M.D.

COLUMBUS, GA.

Cardiac enlargement is usually associated with valvular defects or with hypertension. Once established in connection with these diseases, the enlargement is in general irreversible and constitutes a discouraging feature in the treatment of heart disease. It is, however, interesting and encouraging to consider that there are three distinct conditions causing cardiac enlargement in which the heart returns to normal size after specific therapy. These conditions are arteriovenous aneurysm, beriberi and myxedema. It is my purpose in this article to review briefly the cardiac aspects of these diseases and to bring together from the literature reproductions of x-ray films which vividly portray the return of the heart to normal size.

#### ARTERIOVENOUS ANEURYSM

Figure 1, from a report by the Deans,<sup>1</sup> shows the heart shadow before and after the surgical treatment of an arteriovenous aneurysm. The patient complained of shortness of breath and palpitation. There was a pulsating mass in Scarpa's triangle, over which a thrill

Fig. 1.—The heart before (on the left) and after the operative treatment of arteriovenous aneurysm. (From Joseph and J. C. Dean.<sup>1</sup>)

was palpable and a humming noise audible. Manual pressure over the mass (thus occluding the fistulous opening) caused a change in blood pressure from 140/50 to 150/70. The shortness of breath and palpitation entirely disappeared after treatment. The second film, showing the return of the heart shadow to normal size, was made one month after operative treatment of the aneurysm.

#### BERIBERI

Cardiac enlargement in beriberi has long been recognized. A comprehensive investigation of the cardiac and circulatory changes in beriberi was made by Aalsmeer and Wenckebach,<sup>2</sup> the clinical observations being made in Java by Aalsmeer. All the cases of beriberi, even the mildest, showed perceptible enlargement of the heart on roentgen examination. When polyneuritis is absent, the onset of cardiac failure may be acute, leading to the serious and often fatal condition called by the Japanese "soshin." These cases are characterized by the sudden onset of extreme dyspnea, cyanosis, substernal pain and possibly rapid death. Wenckebach is of the opinion that the absence of neuritis is the

1. Dean, Joseph, and Dean, J. C.: Arteriovenous Aneurysm: Its Effect on the Heart, Wisconsin M. J. 33:587 (Aug.) 1934.

2. Aalsmeer, W. C., and Wenckebach, K. F.: Herz und Kreislauf bei der Beri beri Krankheit, Wien. Arch. f. inn. Med. 16:193 (Jan. 20) 1929.

determining factor in these acute cases. Neuritis forces the patient to go to bed, or at least to curtail his activities markedly, and thus protects him from excessive heart strain.

Wenckebach also states that the cardiac enlargement in beriberi is not a true hypertrophy of the muscle fibers but is rather a colloidal imbibition of fluid, analogous to myxedema, and contrasting with the state of free fluid as in ordinary edema.

Figure 2 is from the studies made by Aalsmeer and shows the rapid return of the heart of a beriberi patient

Fig. 2.—The heart before and after the specific treatment of beriberi. (From Aalsmeer and Wenckebach,<sup>2</sup> their figures 9 a and 9 b.)

to normal size on treatment with foods rich in vitamin B. Fifty-two days intervened between the two films.

Beriberi is far from being a disease purely of academic interest in the United States. Scott and Herrmann<sup>3</sup> state that it has been recognized in Louisiana since 1903. The natives of French descent have known it for a much longer time under the name of the "maladie des jambes." These authors state that the differential diagnosis between beriberi and primary myocardial insufficiency is at times very difficult. Riesman and Davidson<sup>4</sup> have reported two cases of beriberi in Philadelphia. Further, the polyneuritis associated with alcoholism is now known to be a vitamin B deficiency<sup>5</sup> rather than the result of a direct toxic action of alcohol on the nerves. Likewise, the polyneuritis sometimes occurring in pregnancy is probably a deficiency disease.<sup>6</sup> Observation on the size of the heart in cases of polyneuritis associated with alcohol and in infants suspected of vitamin B deficiency would be of extreme interest.

#### MYXEDEMA

The heart enlargement often accompanying myxedema has attracted considerable attention in recent years. Figure 3 is an example observed by me of the effect of myxedema on the heart, and the return of the heart to normal size following thyroid therapy.<sup>7</sup> Five months intervened between the two films, though fluoroscopic observations showed that the heart reached normal size much earlier. This particular patient also showed auricular fibrillation. This patient illustrates

well the fallacy of always considering cardiac enlargement irreversible. He had been previously hospitalized and the cardiac enlargement clearly demonstrated by roentgen examination. The enlarged heart had, however, immediately led to the conclusion that his illness was incurable and he had been discharged after brief digitalis medication.

#### COMMENT

These three conditions, so beautifully amenable to specific therapy, must be considered in the differential diagnosis of all cases of cardiac enlargement. Even an arteriovenous aneurysm in Scarpa's triangle and causing heart symptoms and heart enlargement may not be evident on first examination, as is so strongly emphasized in the case reported by the Deans.<sup>1</sup>

It is of course doubtful whether these instances of cardiac enlargement have any bearing on the larger problem of cardiac involvement in hypertension. However, Christian<sup>8</sup> found that only about two thirds of the cases of nonvalvular cardiac enlargement of middle age are related to present or past hypertension, and he states that there are many "unanswerable riddles" in discussing the relation of hypertension to cardiac enlargement. From this it may be inferred that cardiac enlargement in hypertension is not necessarily the benign compensatory process resulting from purely mechanical causes, as generally considered. Riesman and Davidson<sup>4</sup> are strongly of the opinion that there is a nutritional factor in cardiac patients who have repeated attacks of decompensation. The metabolic origin of another cardiac disease, namely, coronary sclerosis, is a seriously considered hypothesis.<sup>9</sup> Possibly along similar lines of investigation the future may demonstrate that our present conception of cardiac enlargement in hypertension as arising purely from mechanical factors is too naive.

#### SUMMARY

X-ray films show the striking return to normal size of enlarged hearts in arteriovenous aneurysm, beriberi and myxedema. These show that an enlarged heart is

Fig. 3.—The heart in myxedema, before and after specific treatment with thyroid.

not always a permanent irreversible condition. The three diseases are readily amenable to specific treatment and they must be considered either as primary or as contributing factors in the differential diagnosis of all enlarged hearts.

## A SUMMARY OF REGIONAL ILEITIS

WITH REPORT OF A CASE OF COLONIC  
INVOLVEMENT AND SUGGESTION  
OF A NEW TERM

A. J. ROSENBLATE, M.D.

A. A. GOLDSMITH, M.D.

AND

A. A. STRAUSS, M.D.

CHICAGO

For the past three decades a number of granulomatous conditions of the intestine, possessing common symptomatic and pathologic features, have been described. Clinically and microscopically they were mistaken for malignant conditions but, on microscopic examination, proved to be benign, inflammatory lesions. They were also frequently mistaken for appendiceal conditions.

It was not until 1932 that they were described as a distinct entity by Crohn, Ginzburg and Oppenheimer<sup>1</sup> as "regional ileitis." A year later Harris and his collaborators,<sup>2</sup> because of the cicatrizing, inflammatory process and the probable involvement of other portions of the intestinal tract, suggested the term "cicatrizing enteritis."

No definite etiologic factor or factors have been isolated. Infection has been thought of as a possible cause, especially certain of the anaerobic groups. The disease occurs most frequently in young adults, more commonly in males. However, cases have been reported from the ages of 4½ years to 40 years. The usual site of disorder is the terminal ileum, although other portions of the intestine may be involved.

The pathologic condition is "one of proliferation of the hematopoietic cells, and mainly proliferation and irritation of the somatic cells of the intestinal wall."<sup>3</sup> The picture is that of inflammation of the ileac mucosa with subsequent ulceration. The intestinal coats are edematous and thickened. The mesentery is thickened, and the glands are hyperplastic. Eventually, owing to the fibrostenotic process, narrowing of the lumen results. There is a marked tendency toward perforation, and the formation of a localized mass in the right lower quadrant and of a fistula into the adjoining intestine. Microscopic section reveals acute, subacute or chronic inflammatory reactions. Giant and epithelioid cells are present in the later stages.

Clinically, the condition presents the following symptomatic characteristics:

Fever, generally low (highest 103 F.), fluctuating with periods of normality.

Diarrhea, one or two stools daily, containing mucus and at times occult blood.

Anorexia, with progressive loss of weight, secondary anemia and malaise.

Pain, dull and cramplike in the right lower quadrant. If an ileosigmoid fistula exists, the pain may be felt in the left lower quadrant.

Leukocytosis, moderate.

Pulse, rapid.

Stenosis, manifested by constipation with some vomiting, distention, and a palpable mass in the right lower quadrant.

Roentgenologic investigation is the most essential means of establishing a diagnosis and, in conjunction

with the clinical symptomatology, makes a rather definite roentgen picture.

Kantor,<sup>3</sup> in his recent article on "regional ileitis," summarizes the roentgen technic and his observations as follows:

The usual oral opaque meal is employed, as well as a barium sulfate enema. Serial observations are made at hourly intervals from the period just before the cecum fills to the normal period of emptying. This is about three to nine hours after the ingestion of the opaque meal. The patient is then permitted to partake of an ordinary meal as soon as the stomach is empty.

The abnormalities, as revealed by the roentgenologic studies, may be in either the ileum or the colon or both. The changes in the latter may be reflex in nature—that of a secondary spasm—or may show actual progression of the disease from the ileum.

The principal changes in the ileum, briefly, are:

(a) Filling defects just proximal to the cecum.

Fig. 1.—Dilatation of the proximal position of the ileum at three and one-quarter hours.

(b) Abnormality in contour of the terminal loop of the ileum.

(c) Dilatation of ileac loops just proximal to the lesion. (This is demonstrable in the stenotic phase.)

Kantor describes a roentgenologic sign which, though not pathognomonic of the disease, is strikingly suggestive and characteristic. He called this the "string sign," a thin, slightly irregular linear shadow suggesting a cotton string in appearance and extending from the region of the last visualized loop of ileum through the entire extent of the filling defect, and ending at the ileocecal valve. It represents the attenuated barium filling of the greatly contracted intestinal lumen. Weber has recently offered the term "twisted cord appearance" as an alternative for "string sign."

The absence of the string sign does not exclude the disease. In such an instance an effort should be made to demonstrate the filling defects in the terminal ileum and the result accepted as a suggestive finding.

Several other conditions may confuse both the roentgenologist and the clinician and necessitate a differential roentgenologic and clinical diagnosis. The string sign

2. Harris, F. I.; Bell, G. H., and Brunn, H.: Chronic Cicatrizing Enteritis, Regional Ileitis (Crohn), *Surg., Gynec. & Obst.* 57: 637-645 (Nov.) 1933.

3. Kantor, J. L.: Regional (Terminal) Ileitis. Its Roentgen Diagnosis, *J. A. M. A.* 103: 2016-2021 (Dec. 29) 1934.

has been observed in sarcomas and in syphilis of the terminal ileum. A filled appendix dipping into the pelvis may likewise be confusing.

Clinical differentiation includes ulcerative colitis, typhilitis, lymphosarcoma, intestinal or mesenteric tuberculosis, Hodgkin's disease, actinomycosis or malignancy of the terminal ileum, and appendiceal disorders.

Medical treatment is usually unsatisfactory. Surgical intervention is the treatment of choice.

Fig. 2.—String sign, involvement of colon, at five and three-quarters hours.

The case to be considered shows a typical clinical and roentgenologic picture of regional ileitis, with added involvement up to but not including the distal portion of the transverse colon. The patient had been previously treated for four years for subacute bacterial endocarditis (despite negative blood cultures) and renal disease.

#### REPORT OF CASE

Mrs. B. R., white, aged 24, seen Nov. 11, 1934, complained of fever, cramplike pains in the right lower quadrant, and diarrhea. She had daily two or three loose, offensive bowel movements containing a slight amount of mucus but no blood. This had been going on for two weeks, although the cramps had been experienced at irregular intervals for the past five or six years. There was no history of surgery, an accident or venereal disease. One pregnancy ended as a spontaneous abortion at three months. The menstrual history was negative save for a two months amenorrhea following the attacks. Her mother had died of metastatic carcinoma of the breast.

In 1930 the patient had been hospitalized for ten weeks because of fever, rapid pulse, occasional cramps of the right lower quadrant and offensive stools. In her description of the hospitalization she stated that her condition was diagnosed as "heart disease." Later, as bacteriuria was observed, cystoscopy was resorted to and the kidneys were "washed out." This produced some relief, but the highly offensive diarrhea and tachycardia persisted.

The essential physical manifestations, November 11, were: temperature, 99.5 F.; pulse, 110; blood pressure, 120 systolic and 75 diastolic. There was a soft, systolic mitral murmur. A definite, palpable mass was found in the right lower quadrant of the abdomen, very tender to slight palpation, not freely movable, with the maximum points of tenderness in the region of the cecum. Borborygmi were easily auscultated over the entire colon, especially over the ileocecal area. The urine was

normal; leukocytes numbered 14,000; examination of the stool was negative for ameba. The clinical impression was that the patient was suffering from either an appendiceal abscess or colitis.

The patient was placed at complete rest. Except for a rapid pulse and one daily foul-smelling watery stool, with a feeling of relief after defecation, improvement was noted until December 6. On that day, four hours after dinner (which included smoked fish, mashed potatoes and a cold chocolate drink), nausea and vomiting occurred, with a repetition the next day, following a somewhat similar meal. From this time on there was a temperature range of from 99.4 F. in the morning, to 100.5 F. in the afternoon and 100.1 F. in the evening. With such symptoms, investigation was renewed. A more intensive laboratory and roentgenologic investigation was undertaken.

Laboratory examination gave the following results: The Kahn, Wassermann, complement fixation, and Aschheim-Zondek tests were negative. Agglutination tests with the antigens of *Bacillus typhosus*, *B. paratyphosus* A and B, *B. dysenteriae* and *B. enteritidis*, and abortus, melitensis and porcine groups of *Brucella* were negative. Blood cultures for these groups, as well as for staphylococcus and streptococcus organisms, were also negative.

Urine analyses at intervals of three days showed occasional hyaline casts but were otherwise negative.

A blood count showed 4,200,000 erythrocytes with 75 per cent hemoglobin, and 9,100 leukocytes, with 76 per cent neutrophils and 24 per cent lymphocytes. On fecal analysis the milk culture for *Bacillus Welchii* on three occasions showed 4, 2 and 3 plus Gram stain was from 50 to 75 per cent positive. In one instance *Streptococcus viridans* was isolated in culture.

December 17 a barium sulfate enema was administered, but visualization extended only to include the distal portion of the transverse colon. Marked distention of these portions was revealed, but the remainder could not be demonstrated.

Enema administration and examination could not be continued, as the patient complained of violent cramps. The same night she developed a temperature of 103.5 F., with marked chills and pains in the right lower quadrant. Relief was obtained by the use of narcotics. At this time the report of her previous hospital sojourn was received and is quoted here in its entirety:

"Miss B. S. [now Mrs. B. R.] was under observation at the Hospital from April 1 to June 17, 1930. At that time

Fig. 3.—Sagittal section showing ulceration and polyposis.

her complaint was fever. After making complete studies we came to the conclusion that she had a subacute bacterial endocarditis. This diagnosis was made in spite of the fact that repeated blood cultures were negative.

"After being at the hospital for four weeks, we observed that she had an unusually large amount of bacteria in her urine. Cystoscopy revealed an occlusion of one of the ureters, and a partial blockage in the other. They were both dilated with miraculous improvement of the patient. Repeated dilation brought about a complete cure."

Since the patient complained of symptoms similar to the ones in the foregoing report, it occurred to us that a possible urinary condition might exist. To exclude this, cystoscopy was performed, followed by pyelography. The examination was negative, the flat plate, however, showing definite shadows of increased density in the cecum and ascending colon areas. Investigation of the cecum at a later date was deemed advisable.

Jan. 28, 1935, the patient felt better, and it became possible to proceed with the complete roentgenologic examination of the gastro-intestinal tract. Roentgenologic studies revealed

Fig. 4.—Margin of an ulcer; X 80.

nothing abnormal in the chest, esophagus, stomach or duodenum. At three and one-quarter hours there was some dilatation of the proximal portion of the ileum.

At five hours the terminal ileum showed many filling defects, suggestive of polyposis, and a narrowing just about the ileocecal valve, the cecum being contracted.

At five and one-half hours there was a suggestion of a "string sign," the cecum, ascending colon, hepatic flexure and proximal half of the transverse colon showing defects suggestive of polyposis. There was still a gastric residue at this time.

At five and three-quarter and six and one-half hours there was definite demonstration of the "string sign" as well as a definite involvement of the colon up to the midportion of the transverse colon. The remainder of the colon was negative.

Roentgenologic conclusions were that there was terminal or regional ileitis with involvement up to the midportion of the transverse colon, and polyposis.

Combining the clinical, roentgenologic and laboratory observations and recognizing the colonic extension, we consider "ileocolitis ulcerosa chronica" as a phrase more truly descriptive of the picture.

Treatment consisted of general supportive measure, symptomatic medication, ultraviolet radiation, and 1:4,000 acriflavine hydrochloride retention enemas. Relief, at its best, was merely transitory.

February 10, pain in the region of the ileum was experienced and became so severe as to necessitate the use of opium. February 13 witnessed another attack, this time very suggestive of an obstruction.

Because of the recurrence and progressive severity of these pains and the poor results obtained with medical management, surgical intervention was deemed the final treatment of choice, and the patient was operated on by Dr. Alfred Strauss, February 18.

Dr. Alfred Strauss and Dr. Herman Strauss reported on the removal of the lower part of the ileum, the ascending and part of the transverse colon as follows:

A right rectus incision was made. The cecum and transverse colon were brought forward. Before opening the abdomen under anesthesia one could palpate the colon as a hollow tumor mass through the abdomen. When the abdomen was opened a typical regional ileitis was found. About 8 to 10 inches (20 to 25 cm.) of the terminal ileum, cecum and ascending colon, and about half the transverse colon was a solid infiltrated tumor mass, verifying the roentgen examination.

The parietal peritoneum was freed laterally. The mesentery was clamped and cut. The ileum was taken well wide of the inflammatory area. Clamps were placed and amputation was done. The ends were carefully cauterized and covered. The mesentery was clamped, cut and ligated in the usual manner, to the middle of the transverse colon. The bowel was transversely clamped and cut and the ends were carefully cauterized and phenolized. The mesentery was sutured, the parietal peritoneum was recovered, and the two cut ends were brought through the incision. The incision was closed in the usual manner. The operation was done rapidly with good hemostasis, the time being one hour and ten minutes. The patient left the operating room in good condition.

The clinical diagnosis was terminal ileitis.

A pathologic diagnosis, furnished by Dr. Otto Saphir, February 22, on microscopic examination, was marked acute pseudomembranous and ulcerating enterocolitis. Histologically, a bacillary dysentery infection was suggested.

The gross specimen consisted of a terminal portion of the ileum, measuring 18 cm., and a cecum, with attached appendix, measuring 30 cm. in diameter. The serosa of the ileum was a purple red, smooth and shiny. The serosa of the cecum was completely covered by fatty tissue. The walls of both ileum and cecum seemed thickened, especially in the region above the ileocecal valve. The mucosa of the last 8 cm. of the ileum was markedly thickened and polypoid. The polyps had very wide bases and appeared fused. Occasionally a bridge of mucosa could be demonstrated between the polyps. The mucosa between the polyps was a grayish white. The mucosa of the

Fig. 5.—Polypoid elevation (high)

cecum was similarly involved. Many of the polyps here had narrow bases.

Under gas anesthesia the old scar was excised, June 4. The two ends of the bowel were easily freed from the belly wall. Then an end-to-end anastomosis was made with gastro-intestinal and interrupted silk sutures. The abdominal wall was closed with interrupted chromic catgut, with a Penrose tube brought out through the incision.

The patient made an uneventful recovery. She gained 30 pounds (13.6 Kg.) and at present is free from all symptoms.

## SUMMARY

1. The picture of regional ileitis is that of dull pain in the right lower quadrant, low grade intermittent fever, slight diarrhea, anorexia, anemia and rapid pulse.

2. Roentgenologic studies of the ileum reveal characteristic manifestations.

3. In cases in which the pathologic condition extends to the colon, we suggest the term "ileocolitis ulcerosa chronica."

4. The treatment of choice is surgery.

## Clinical Notes, Suggestions and New Instruments

### SAFE LIGATURE OF THE RENAL PEDICLE WITH CLAMPS OF NEW DESIGN

HUGH H. YOUNG, M.D., BALTIMORE

Safe handling of the renal pedicle in cases requiring nephrectomy often furnishes a serious problem to the surgeon. Too often have one or more vessels slipped from the grasp of the clamps when the pedicle has been divided. Sometimes only one vessel has escaped and given the surgeon a painful period

have advocated leaving clamps on the pedicle and removing them about four days later, but I know of one instance, when, even after more than four days, removal of the clamps was followed by a fatal gush of blood from a greatly dilated renal vein in a case in which nephrectomy had been done for a huge tumor.

Inspection of pedicles which have been crushed by strong clamps shows that the tissue remaining between the jaws of the clamps is so greatly reduced that when the ligature is tied the amount of tissue within it is minimal. The problem is to insure that the ligature will not slip. Conceding that two well placed ligatures of heavy chromic catgut are requisite, the question is how to prevent their slipping off the pedicle.

After having tried various procedures, I present herewith some specially designed clamps which I believe answer the problem of safe ligature of the renal pedicle. The technic and *modus operandi* of the individual clamps are so well shown in Mr. Didusch's drawings that further description is scarcely necessary. As seen here, three clamps are employed. The first (No. 1) is placed fairly deep, but still not too close to the aorta or vena cava. As seen in figure 1, each blade of the first clamp is cut away obliquely on the concave border, so that the surfaces, which come together, are thus narrowed. The second clamp is cut away obliquely on the convex border. When the blades of clamp 1 are forcibly brought together across a pedicle, the obliquity of the outer concave edges crowds the tissue of the pedicle outward and the clamp inward (fig. 2). The second clamp is cut away on the convex border and, when applied, the tendency is for the clamp to be pushed outward

Fig. 1.—Young's pedicle clamps with oblique cut away of adjacent borders. The blades of clamp 1 are cut away obliquely on the concave border and the blades of clamp 3 on the convex border. Clamp 2 is similarly cut.

Fig. 2.—1, the new clamps are shown on the pedicle. In sectional view, 2, the humps or ridges of tissue forced up by the cut-away clamp blades are depicted. Placing the ligature in the groove, left by releasing the clamp, is shown in sectional view 3, and in 4.

while searching to stop the bleeding and successfully place a ligature. In one of my cases the vessels retracted so deeply behind the colon that it was impossible to find them.

Some surgeons have held that each individual vessel should be isolated and ligated, but they are often matted together in inflammatory or fibrous masses, and, in attempts to isolate them, tears are made which further complicate the problem. Owing to the dangers of ligatures slipping, some surgeons

while the tissues between the two clamps are forced up in the form of a prominent transverse ridge on each surface of the pedicle (2, fig. 2). The application of these clamps thus automatically produces a transverse ridge or shoulder of tissue between them.

I prefer to apply a third clamp next to the renal pelvis and kidney to insure against cutting into these structures. It is particularly important in malignant and tuberculous cases for these structures not to be opened when the pedicle is divided. I therefore prefer to place the third clamp externally next to

the kidney. The clamp I use is thinner and straighter than the others, but each blade is also cut away obliquely along its external border, thus insuring the production of a transverse hump or ridge of tissue between the second and third clamp. The operator, being certain that such has occurred, may safely cut with a knife or scissors as close as possible to the external clamp (2, fig 2) and then proceed to ligate the pedicle.

It is important that the first or deeper ligature should sink into the bottom of the two grooves produced by the clamp.

Fig 3—Three ordinary pedicle clamps are shown placed close together. Sectional view 2 shows the thinly compressed pedicle and absence of ridges or shoulders of tissue between clamps.

After a strand of No. 3 chromic catgut has been placed around the pedicle beneath the deepest clamp (No. 1) the clamp is slowly loosened as the first knot is tied (3, fig 2). This insures that the ligature slips into the groove and does not remain on the uncompressed pedicle beyond it. As this knot is drawn tight, the clamp is removed, the second and third knots are tied and the ligature is cut. An inspection should then be made to make sure that the technic has been satisfactory and that the ligature is tight. The second ligature is then placed by the same method, clamp 2 being slowly released and removed as the ligature is tied. After this procedure one sees a mass or shoulder of tissue lying external to each ligature (4, fig 2). The shoulders effectively prevent slipping of the ligatures or escape of a vessel from the grasp of the clamps before ligatures have been placed. These renal pedicle clamps Nos. 1 and 2 are provided with the longitudinal grooves along the opposing surfaces of the blades instead of transverse grooves because we have found that they are better adapted for pedicle clamps.

The most important detail is the oblique edge on opposite sides of the two pedicle clamps which effectively forces up a mass of tissue between the clamps and furnishes the shoulder for the important first ligature. The shoulder for the second ligature is produced by the design of the third clamp and its straighter form (less curve), which

automatically leaves more tissue between it and the second clamp. The same scheme might also be used for the first and second clamps, the second clamp forming somewhat of an arc across the more curving first clamp and thus insuring a mass of tissue between them, but I believe that the oblique cutting away of the opposite edges of these two clamps accomplishes a better result. Clamps of parallel curvature are more easily placed, especially in short pedicles and more difficult positions beneath large renal masses.

In figure 3 the ordinary pedicle clamps have been placed close together. The sectional view, 2, shows the thin crushed pedicle with little or no tissue between the clamps. It is to be noted that little or no shoulder is present to hold either the first or the second ligature. Figure 4 is a longitudinal section of two pedicles that have been clamped, hematoxylin stain. Note mass of tissue between areas clamped by new instruments. It seems evident that cases of ligature slipping which have been reported not infrequently have occurred as a result of the failure of the operator to secure a shoulder behind which to tie his ligature and thus prevent its slipping. By being careful to see that such shoulders are secured for every pedicle ligature, either with the special obliquely cut clamps presented herewith, as shown in sectional view 3 or by other technical methods described herein, I believe it should be possible to prevent the many accidents, some with fatal ending, that have occurred in surgical practice. Similar technic may be applied to vessels and pedicles requiring ligation in other parts of the body.

#### DERMATITIS MEDICAMENTOSA DUE TO QUININE

R O SETTLE, M.D., WAUPUN, WIS.

H. W., a white man, aged 23, presented himself at the dispensary, April 8, 1932, for treatment of a skin eruption. He reported the presence of an itching, burning eruption of the hands of twelve hours' duration. He stated that he had not recently exposed his hands to any unusual irritant substance and that such a condition had never occurred before. His dentist had extracted a tooth for him the morning before, that evening he had taken two tablets of a proprietary nature (Anacin) containing acetophenetidin, acetylsalicylic acid, caffeine and quinine sulfate, which had been given him by the dentist to relieve any pain he might have following the extraction.

The patient was well developed and in apparently robust health, except that he held his hands out in front of him with the fingers spread, as though to lessen the discomfort. On the palms of both hands were found several lesions of the skin of a somewhat varied character, the most fully developed being a bulla with an acute inflammatory base about 3 cm in diameter, as shown in the accompanying illustration. Others were erythematous patches with varying degrees of bleb formation in their centers. Four such lesions were found on the palmar surface of each hand. Further examination disclosed a somewhat similar lesion in the center of the tongue, which had occurred at the same time but without bleb formation. General physical examination revealed no abnormal manifestations, except for a blood pressure of 160 systolic, 80 diastolic, a weight of 226 pounds (102 Kg.), several suspicious teeth and a recently emptied tooth socket, absent achilles tendon reflexes, and a slight enlargement of the thyroid. The blood Wassermann reaction was negative and a blood count and urinalysis were negative. He had no fever. Previous medical records of the patient disclosed that he had received antisyphilitic treatment for a considerable period was released from treatment after becoming serologically negative and had remained so in the interim. A diagnosis of essential hypertension had been made at one time, the systolic pressure had varied between 150 and 190 over a period of several years. He had had rheumatic fever in childhood. Two years earlier he had been under observation for a suspected psychosis, which had never developed.

The dermatitis of the hands was treated by incision and débridement of the blebs and the application of antiseptic and soothing ointments. Healing was complete in four weeks without scarring or pigmentation.

The patient reported fourteen months later, June 6, 1933, with identically the same condition, the eruption again having occurred after a visit to the dentist and the ingestion of several

Fig 4—A renal pedicle which had been clamped with ordinary pedicle clamps. This is a longitudinal section mounted and stained. Note how thin the tissues of the pedicle have become and the very little elevation of tissue between areas clamped. B same—new clamps used. Note the fairly considerable mass of tissue between the clamped areas. This insures that the ligatures will not slip.

Anacin tablets. There had been no tooth extraction at this visit, however. Lesions occurred in precisely the same location as before but with a greater degree of bleb formation. Also, several new lesions were found on the hands and one on the back of the trunk. All healed completely as before, without scarring or pigmentation, but required several weeks in the process.

Two subsequent attacks followed, one Nov. 6, 1933, and another Feb. 2, 1934. These attacks had not been preceded by a dental treatment or the use of Anacin. However, shortly

Appearance of lesions and blebs on hands.

before the last appearance of the dermatitis he had had a cold and had taken several cold tablets that were prescribed for him. When the eruption occurred the last time, the patient was hospitalized and it was discovered that he had a low fever, which persisted throughout the acute stage. After healing was practically complete a search for a causative agent was begun. Several of the ingredient drugs of the Anacin and cold tablets had been tried without effect when it was noticed that the only ingredient common to the two was quinine. A patch test on the arm with an alcoholic solution of quinine sulfate resulted in only a very mild erythema. A scratch test with the same solution on the other arm the next day, however, caused an intense erythema around the scratch and a sudden exacerbation of the subjective symptoms at the site of the healing lesions on the hands; i. e., marked pruritus and burning lasting several hours. When complete healing had resulted, February 26, the patient was given a capsule containing 2 grains (0.13 Gm.) of quinine sulfate. Intense burning and itching of the hands occurred within three hours. Within twelve hours there was erythema at the site of the previous lesions, and within twenty-four hours the condition had been completely reproduced as before. Photophobia and a stinging sensation in the eyes appeared as new symptoms following the oral administration of the quinine.

An interesting observation was the recurrence of the lesions each time in the exact locations as before, with almost identically the same configuration, but in different stages of development. That is, several of the lesions at the first outbreak did not become bullate, but at each succeeding appearance of the condition larger and larger blebs developed. At each subsequent appearance of the dermatitis one or two new lesions would be found, almost all being confined to the hands, those not on the hands were few and scattered and did not form blebs but remained as erythematous patches about 2 cm in diameter. The lesion in the center of the tongue, resembling a mucous patch with an inflammatory base, recurred each time.

After the patient was informed that he possessed an idiosyncrasy to quinine he volunteered the information that while serving in the army in the tropics he had taken quinine daily as a prophylactic for a considerable period of time without untoward effect. This history lends weight to the idea that the patient had an acquired sensitization to the drug. By avoiding the ingestion of quinine he has had no further recurrence of the skin trouble to date.

Wisconsin State Prison

## AN UNUSUAL CASE OF TERATOMA TESTIS

LLOYD F. CRAVER, M.D., AND FRED W. STEWART, M.D.  
Attending Physician and Associate Pathologist, Respectively,  
Memorial Hospital  
NEW YORK

### REPORT OF CASE

**History.**—C. F. S., a high school boy, aged 15 years, applied at the Memorial Hospital, May 24, 1935, having been referred by his local physician, Dr. W. R. Janeway, of St. George, Staten Island. The chief complaints were dyspnea and pain in the right shoulder and chest. The father and mother were living and well. The maternal grandmother died of cancer of the uterus. The maternal grandfather died of tuberculosis. The patient had measles, pertussis and varicella in infancy, an appendectomy in 1931 and tonsillectomy in 1932.

For two months prior to admission to the clinic the boy had complained of pronounced fatigue following the gymnasium period in school. Three and a half weeks before admission he had one day shortness of breath and pain in the right shoulder and right chest. After resting in bed one day he returned to school apparently in good health, but a week later he again complained of the same sort of pain and of dyspnea. Two weeks before admission to the Memorial Hospital clinic he had been admitted to another hospital, where an x-ray film of the chest disclosed a large mediastinal mass, displacing the heart to the left and projecting well into the right side of the chest. He had no cough and had lost no weight.

**Physical Examination.**—The patient was apparently in fairly good general condition. Examination of the eyes, ears, nose and throat gave negative results. In the neck were a few very small lymph nodes barely palpable in the left posterior cervical chain. The blood pressure was 110 systolic, 60 diastolic. The heart rate was 88. There were no murmurs. Breath-

Fig 1—Gross appearance of mediastinal tumor.

sounds were decreased over the entire right side, especially posteriorly below the level of the fourth dorsal vertebra. Dulness was observed over the right side of the chest posteriorly and laterally at the base. Anteriorly, the mediastinal dulness at the level of the heart extended four fingerbreadths to the right of the sternum. Examination of the abdomen was negative. The testicles were atrophic, about one-fourth the normal size.<sup>1</sup> A roentgenogram of the chest disclosed numerous dense

<sup>1</sup> The patient's mother subsequently informed us that he had never had mumps.

large and small rounded shadows suggesting metastatic deposits. Blood examination revealed: hemoglobin, 85 per cent; erythrocytes, 4,480,000; leukocytes, 15,800; polymorphonuclear cells, 71 per cent; large lymphocytes, 5 per cent; small lymphocytes, 17 per cent; transitional cells, 5 per cent; eosinophils, 2 per cent.

A provisional diagnosis of metastatic intrathoracic malignant tumor, primary, unknown, was made.

As an attempt at palliation, high voltage roentgen therapy, 300 roentgens five times to each of four quadrants of the chest, anteriorly and posteriorly, was given at daily intervals.

Fig. 2.—Typical choriocarcinomatous appearance as shown in all metastases.

May 28, four days after the patient's admission to the clinic, speculation concerning the association in an adolescent male of marked testicular atrophy with multiple intrathoracic metastatic deposits resembling those seen in cases of teratoma testis led to our suggestion that this patient might have some testicular tissue elsewhere than in the scrotum which had given rise to a teratoma. While we regarded our own suggestion as rather fanciful, we decided to have the urine tested for the follicle stimulating factor. To our surprise the report was that at least 10,000 mouse units was present per liter of urine. This indicated the presence of a teratoma and suggested choriocarcinoma.

*Course.*—At the middle of the cycle of roentgen treatments on June 19 the patient complained of severe frontal headaches. The next day he was obliged to discontinue treatment because of his poor general condition.

June 23 he was admitted to the ward, being disoriented and incontinent. The pupils were widely dilated. The deep tendon reflexes were exaggerated, and there was a questionably positive Babinski sign bilaterally. Spinal tap showed persistently bloody fluid under increased pressure.

The next day, June 24, just one month following admission to the clinic, he died.

*Autopsy.*—The subject was a well developed, rather emaciated white boy. Rigor was absent. The pupils were equal but dilated. There was no superficial palpable adenopathy.

The tissues of the anterior mediastinum were edematous. Overlying the entire anterior pericardium, attached to it and to the diaphragm, and fusing inseparably with that portion of

the right lung overlying the heart, was a bulky, soft, cystic, reddish to brownish red, very friable, hemorrhagic tumor (fig. 1). Its position was too low for thymoma and furthermore it failed to show the characteristic involvement of the great vessels at the base of the heart. Throughout the lung parenchyma of both sides were numerous similar hemorrhagic tumor nodules. Dissection of the bronchi failed to reveal any areas of ulceration that might indicate bronchogenic origin. Numerous nodules of tumor appeared on the pleural surfaces, parietal and visceral, and a bulky mass was attached to the periosteum and muscles of the ninth and tenth ribs and interspaces. Uninvolved areas of pleura showed a gelatinous edema. No evidences of pneumonia were found. The mediastinal lymph nodes were clear.

Aside from marked congestion of the liver, spleen and kidneys, and two small hemorrhagic metastases in the dome of the liver, the entire abdominal viscera were negative.

Both testes were small, very firm and atrophic. No tubules could be seen. The seminal vessels were atrophic, the prostate was normal. The right testis was of homogeneous color and consistency throughout. In the left testis, similar in all other respects to the right, were two small nodules. The upper of the two, situated near the rete, was a small whitish cyst 3 mm. in diameter. The lower, about 1 cm. removed from the former, appeared like a small focus of mucinous tissue not more than a millimeter in diameter. After hardening, the entire testis was cut in serial slices with a razor and nothing else suggestive of a primary tumor could be found. Search was made for pinpoint hemorrhagic areas or foci of pigment but without avail.

Fig. 3.—Diffuse interstitial cell hyperplasia characteristic of both testes. Rare atrophic testicular tubules.

The immediate cause of death appeared to have been increased intracranial pressure, the result of cerebral metastases with hemorrhage. The pituitary was grossly and microscopically normal.

Histologically the main tumor within the thorax proved to be a classic choriocarcinoma, as were of course the other metastases (fig. 2). Both testes were completely atrophic. Very rare degenerated nonfunctional testicular tubules were found in the midst of a generalized bilateral diffuse overgrowth of large interstitial cells (fig. 3). The two distinct nodules

described in the left testis were of great interest. The upper one consisted of a cyst lined by sloughing stratified squamous epithelium as in a cholesteatoma. The very small mucoid area proved to be an adult-looking branching mucous gland with fully developed ducts (fig. 4). No evidence of other teratoid structure was found.

One is therefore probably justified in assuming that in the early stage of the teratoma a choriocarcinomatous portion reached the systemic circulation with fatal results, whereas any residue in the testis disappeared probably through hemorrhagic necrosis. The remainder of the primary tumor remained quiescent in the form of a small cholesteatomatous cyst and a minute area of adult mucous glands.

Blood obtained at autopsy was assayed for the follicle stimulating factor in the urologic laboratories (Dr. R. S. Ferguson) and reported as yielding 250,000 mouse units per liter.

Fig. 4.—Single adult mucous gland which with a cholesteatomatous cyst constituted the entire testicular tumor residue.

#### COMMENT

The foregoing case report is almost completely analogous with that pictured in De Vries' atlas<sup>2</sup> and reported in the thesis of den Hartog.<sup>3</sup> In that case the only rudiment of teratoma found consisted of a small pigmented area, which they identified as retinal pigment. Adjacent to it was a small cyst 5 mm. in diameter, which proved to be an abscess. The extraordinary interstitial cell hyperplasia in the present case was not found in that of De Vries and den Hartog. The latter writer mentions only a slight increase of interstitial cells. The case furthermore suggests that of Prym,<sup>4</sup> who described choriocarcinomatous metastases from a small tumor of the testis, which had undergone complete local healing by sclerosis, and once more raises questions of interpretation in reports of extragenital choriocarcinoma.

#### URETERO-INTESTINAL IMPLANTATION.

GEORGE W. WRIGHT, M.D., AUGUSTA, GA.

Increasing interest in uretero-intestinal implantation might warrant a review of this case, especially because of the observations made at autopsy six months after operation.

C. H. F., a white man, aged 44, admitted to the surgical service of the University Hospital, Jan. 26, 1935, complained of the symptoms of an intractable cystitis of nine months'

Fig. 1.—Appearance of specimen after bowel had been filled with sodium iodide solution. Note that no reflux occurred of sodium iodide solution from the bowel into the ureters.

duration. The patient passed small amounts of cloudy, usually bloody, urine every ten to thirty minutes during the day and every hour or two at night. There was sharp pain radiating down the shaft of the penis during the act of micturition and

Fig. 2.—After injection of ureters with sodium iodide solution: moderate dilatation of renal calices and of the ureters.

sharp, burning perineal, deep pelvic and suprapubic pain immediately after voiding. All symptoms had become progressively worse, and at the time of admission there was constant strangury and dribbling of urine from the urethra. Loss of weight amounted to 35 pounds (16 Kg.).

From the Department of Surgery of the University of Georgia School of Medicine.

During the three months prior to admission the patient had experienced several attacks of pain in the region of the right kidney, accompanied by elevation of temperature.

The patient was fairly well developed but somewhat wasted; the facies was drawn and anxious, and the skin dry and pale. The weight was 120 pounds (54.4 Kg.), the blood pressure 104 systolic, 70 diastolic, the temperature 98.2 F., and the pulse 70. There was tenderness on pressure at the right costovertebral angle and in the suprapubic area. The lower pole of the right kidney was palpable and tender. Rectal examination revealed that the tone of the sphincter was good, and that the prostate was slightly enlarged and boggy.

The urine was a reddish brown and quite turbid because of the presence of gross amounts of blood and mucus. It showed a specific gravity of 1.028, and a three plus albumin. Microscopic examination revealed innumerable red blood cells, leukocytes and mucous shreds. Examination of the blood showed red blood cells 4,100,000, white blood cells 7,000 and hemoglobin 75 per cent. Nonprotein nitrogen, uric acid and sugar determinations of the blood were within normal limits. The Wassermann reaction was negative.

Cystoscopic examination showed severe cystitis with marked contraction of the bladder. An extensive, infiltrating new growth was found involving the trigon, the region of the left ureteral orifice, and extending upward toward the dome of the bladder. A large, fungating, ulcerated area occupied the center of the tumor. The right ureteral orifice was several times the usual size. The left ureteral orifice was not located. The right ureter was catheterized and a specimen from the kidney contained from 40 to 50 leukocytes, a few red blood cells and 1 or 2 granular casts per high power field. A section of tissue was removed from the new growth for biopsy. The diagnosis was infiltrating carcinoma of the bladder and right pyelonephritis.

Retrograde pyelography revealed considerable dilatation of the minor calices of the right kidney. Cystography, following the injection of 50 cc. of sodium iodide solution, showed considerable contraction of the bladder, its margins irregular and the lower 7 cm. of the right ureter filled and dilated. Excretory urography demonstrated moderate dilatation of the renal calices on both sides.

February 4, a simultaneous, bilateral ureteral transplantation into the rectosigmoid was done according to the second method of Coffey,<sup>1</sup> size 12 F. ureteral catheters being used. Specimens of urine collected from each of the catheters on the day of operation contained from 50 to 75 leukocytes and an occasional granular cast per high power field. Convalescence was uneventful, the right catheter being removed on the tenth post-operative day and the left catheter on the eleventh day.

During the succeeding weeks and months the patient experienced complete relief from all symptoms existing prior to operation. He returned to work and gained 30 pounds (13.6 Kg.) but was not entirely willing to submit to cystectomy. Urine was passed from the rectum every four to six hours during the day and once at night, but there was no leakage of urine through the anus. Nonprotein nitrogen and uric acid determinations of the blood at regular intervals were within normal limits. Phenolsulfonphthalein excretion in the urine passed from the intestine in two hours was 40 per cent. Intensive roentgen therapy was administered at regular intervals for treatment of the bladder tumor.

August 8 an exploratory laparotomy was done because of intestinal obstruction of twelve hours' duration. Volvulus of the terminal ileum was found and released. Because its color appeared good, the involved section of intestine was not resected. A catheter enterostomy was done above the site of the volvulus. Death occurred on the fifth postoperative day.

At autopsy,<sup>2</sup> a few hours after death, the kidneys, ureters and segment of intestine into which the ureters had been transplanted were removed intact. The proximal end of the segment was occluded by a heavy gauze ligature, the intestine was then completely filled with sodium iodide solution and the distal end was ligated. Considerable pressure was made on the filled segment before a roentgenogram of the complete specimen (fig. 1) was obtained. There was no reflux of the radiopaque material into the ureters. The ureters were next

injected with sodium iodide solution and a roentgenogram was obtained (fig. 2). Moderate dilatation of the calices of each kidney as well as moderate enlargement of the ureters was demonstrated. The dilatation of the calices appeared to be no greater than the moderate dilatation observed before uretero-intestinal implantation.

The total weight of the two kidneys was 450 Gm. The capsule of each stripped with slight difficulty; the surfaces were slightly granular and presented many irregular indentations. The renal pelves and calices were of normal appearance. The cortical markings were distinct and regular, though the cortex was observed as slightly irregular in thickness. Microscopic examination revealed chronic pyelonephritis with moderate scarring. The colon and upper portion of the rectum above the site of ureteral implantation showed nothing unusual. Below the site of operation the rectum was somewhat dilated and the mucosa smoothed out. There was no evidence of ulceration. The bladder was markedly contracted but otherwise normal. Apparently the cause of death was necrobiosis of the terminal ileum with thrombosis of the mesenteric vessels, peritonitis and bronchopneumonia.

#### COMMENT

The case here reported is illustrative of the feasibility of uretero-intestinal implantation. The moderate degree of hydronephrosis said to occur following simultaneous bilateral operation in which ureteral catheters are necessarily employed was not observed in this case. Despite the existence of bilateral pyelonephritis prior to as well as at the time of operation, no gross renal damage was demonstrable at autopsy six months later. One might reasonably conclude that the condition of the kidneys had improved. Roentgen therapy and complete rest had apparently cured the bladder tumor.

753 Broad Street.

## Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORTS. HOWARD A. CARTER, Secretary.

### RADIOEAR DE LUXE HEARING AID, TYPE B-20, ACCEPTABLE

Manufacturer: E. A. Myers and Sons, Pittsburgh.

The Type B-20 Radioear De Luxe is an electrically operated, wearable, artificial hearing aid. The outfit consists essentially of a microphone, an amplifier, a battery supply, and an air or bone conduction receiver.

The microphone employs the simple telephone hook-up principle, modified to the manufacturer's design. The "intensifier" is an auxiliary amplifier which mechanically and electrically increases the amplitude of the electrical output of the microphone.

The power is obtained either from special hearing aid batteries or from three standard flashlight cells; for the latter cells, a battery case is supplied as standard equipment. The efficiency of the instrument is practically independent of either

Radioear De Luxe Hearing Aid.

of these two sources of battery supply; it depends on the proper operating voltage, and this can be obtained either with the small flashlight cells or with the larger hearing-aid battery. The hearing-aid battery, because of its larger size, gives longer service per battery unit; but, if the smaller cells are changed when they depreciate below the recommended operating voltage, the smaller and less expensive flashlight cells are as efficient as the special battery.

The principle of operation is the same for either the miniature air conduction receiver or the bone conduction receiver, as in each case the electrical impulses are converted by the receiver into mechanical impulses. In the air conduction receiver this converted energy is applied in the conventional manner through the middle ear, and with the bone conduction receiver the mechanical structure of the receiver is such that satisfactory

1. Coffey, R. C.: Transplantation of the Ureters into the Large Intestine. Surg., Gynec. & Obst., 47: 593-621 (Nov.) 1928.  
2. Autopsy was performed by Dr. F. H. Van Wagoner of the Department of Pathology of the University of Georgia School of Medicine.

results are secured by the application of the receiver unit to the mastoid or other cranial bones. The miniature air conduction receiver is held in place either by one of the Radioear adapters or by an individually molded ear piece made from a plaster impression of the ear. The bone conduction receiver is retained in operating position by a headband.

This unit was tested under actual conditions by an investigator selected by the Council, who considered the device satisfactory.

When special hearing aid batteries are sold for hearing units, the Council believes that the battery terminals should be standardized so that a battery, no matter where purchased, will fit all makes of hearing aids. Furthermore, the Council believes that, when these devices are prescribed or sold, the company should permit the patient to try them and be certain that they will fit his specific type of deafness under the particular circumstances in which he is most desirous of aid.

In view of the results of the investigation of this unit the Council voted to include the Radioear De Luxe Hearing Aid (Type B-20) in its list of accepted devices.

### FISCHERQUARTZ ULTRAVIOLET LAMP, MODEL NO. 77, ACCEPTABLE

Manufacturer: The Fischer Corporation, Glendale, Calif.

The Fischerquartz Ultraviolet Lamp, Model No. 77, is a "cold quartz" ultraviolet generator and consists of a tube of fused quartz about 7 mm. in outer diameter, bent into three concentric, hexagonal rings, the outer one being about 4½ inches in diameter. Directly back of this grid ("burner") is a flat, etched, aluminum reflector, 8½ inches in diameter, around the edge of which is a flange of bright metal, about 10 inches in diameter and 1½ inches in depth.

The transformer used to operate the "burner" is placed in the base of the support of the lamp. The lamp in its reflector is attached to an extension arm and clamped to the upright support, which permits projecting the radiation of the lamp in various directions.

In a physical laboratory acceptable to the Council, the erythemogenic ultraviolet radiation emitted by the lamp in its mounting was measured, in absolute units, by means of balanced thermopile and filters, in accordance with international procedure.

At a distance of 2 feet from the front edge of the quartz tube (the "burner"), the energy flux of wavelengths shorter than and including 3,130 angstroms was 1,050 ergs per square centimeter per second ( $105 \mu\text{W}/\text{cm}^2$ ). Of this amount about 97 per cent is contained in the strong resonance emission line of mercury vapor at 2,537 angstroms.

Assuming an erythemogenic efficiency of 50 to 55 per cent at the 2,937 angstrom line the calculated time of exposure to produce a threshold (M. P. E.) erythema is about seven minutes.

Exposure of small areas (2 by 6 mm.) of the unpigmented inside upper arm at a distance of 2 feet from the lamp, for intervals of from five to twenty minutes, produced a decided reddening of the skin in seven minutes. The twenty-minute exposure was overexposed and sore to touch.

Since the erythema test was made on a skin of average pigmentation, it is evident that a blond-skinned person should not be exposed longer than about five minutes, at a distance of 2 feet from the burner of this type of lamp.

The intensity of the ultraviolet is above the minimum for acceptance adopted by the Council. With the understanding that this lamp is to be used for irradiation of the body (not applicable for cavity irradiation) for therapeutic purposes, under the guidance of a qualified physician, the lamp was recommended for acceptance by the Council's clinical investigator.

The Council wishes to make it clear that such a lamp has nothing in common with "sun lamps" and that it is no more applicable than other small therapeutic lamps, for home use under the directions of a physician.

In view of the favorable report on this unit, the Council on Physical Therapy voted to include the Fischerquartz Ultraviolet Lamp, Model No. 77, in its list of accepted apparatus.

## Council on Pharmacy and Chemistry

### ANNUAL MEETING OF THE COUNCIL ON PHARMACY AND CHEMISTRY

The Council on Pharmacy and Chemistry of the American Medical Association held its annual meeting at the Palmer House, Chicago, Friday and Saturday, March 13 and 14, 1936. Those present were:

Dr. David Barr	Dr. Ernest E. Irons
Dr. J. Howard Brown	Dr. Paul Nicholas Leech
Dr. E. M. Bailey	Dr. G. W. McCoy
Dr. H. N. Cole	Dr. E. M. Nelson
Dr. S. W. Clausen	Dr. W. W. Palmer
Dr. C. W. Edmunds	Dr. William C. Rose
Dr. Morris Fishbein	Dr. Torald Sollmann
Dr. E. M. K. Gelling	

Prof. W. E. Anderson of Yale University and Dr. Olin West, General Manager, were also present.

Dr. Torald Sollmann was elected chairman of the Council and Dr. W. W. Palmer was elected vice chairman.

Among the many items discussed during the meeting, the following may be of interest both to physicians and to manufacturers:

*Note of Appreciation to Dr. Reid Hunt.*—The following communication, signed by all the members of the Council attending the meeting, was sent to Dr. Reid Hunt, who recently resigned.

The Council in session recalls the many years in which it was guided and inspired by your leadership. Your presence and wise counsel are greatly missed.

The Council sends greetings and best wishes for the coming years.

*Federation of the Councils and Reorganization of the Work.*—The Council discussed extensively the plans for the reorganization of the Council on Pharmacy and Chemistry, the Council on Physical Therapy and the Committee on Foods. The reorganization contemplates a federation of these groups particularly for administrative purposes and as a means of handling overlapping problems. The reorganization is not for the purpose of amalgamation. The plans of the headquarters building have been designed to take care of a more closely unified executive control. There has been appointed a Cooperative Committee on Policy, Rules and Procedure representing the three groups, whose purpose it is to make suggestions to the respective groups on problems of mutual interest. The committee is composed of Dr. E. M. Bailey, Dr. John S. Coulter, Dr. Morris Fishbein, Dr. E. E. Irons, Dr. Paul Nicholas Leech and, ex officio, Dr. F. C. Bing and Mr. Howard Carter. The Council on Pharmacy and Chemistry concurred in the recommendation of the Cooperative Committee on Policy, Rules and Procedure that certain recommendations be made to the Board of Trustees concerning the executive details of the work on reorganization.

*Seals of the Councils.*—The Cooperative Committee on Policy, Rules and Procedure recommended to the Council on Pharmacy and Chemistry and also to the other councils that the separate seals of the individual councils be retained. The Council adopted the recommendation.

*Vitamins.*—The Council considered the question of when and how much clinical data should be required before accepting vitamin preparations. The referee on vitamin preparations presented the following report:

Clinical data may not be required under the two following conditions: (1) when the product belongs to a class in which experience has already shown that a close correlation exists between biologic or chemical assays and clinical effects and (2) when the product is to be used only for purposes already established by clinical experience. Examples of such products are cod liver oil, halibut liver oil, viosterol (made in the usual way, but not ergosterol activated by novel methods or dissolved in novel solvents).

Clinical data should be required under the following conditions: 1. When biologic or chemical assays of the class of product cannot (as yet) be regarded as closely correlated with clinical effects, for example: (a) Certain concentrates or highly purified vitamin preparations not yet thoroughly tried in clinical practice, such as purified vitamin A, carotene, cevitamic acid, crystalline vitamin B<sub>1</sub>. There is every reason to believe that such products will sooner or later be so well tried that clinical data may no longer have to be submitted, but that exact chemical, physical

Fischerquartz  
Ultraviolet  
Lamp, Model  
No. 77.

and biologic standardization will suffice. But at the present time, exact clinical data on absorption, the best means for administration, stability, etc., are incomplete. (b) Certain foodstuffs fortified with vitamins. At the present time there is no convincing clinical evidence clearly justifying the claims made by some manufacturers for the activity ascribed to the several constituents of their foods.

2 Clinical data are also urgently indicated when vitamin products are advocated for use in treatment of conditions not clearly due to vitamin deficiency in the ordinary sense; for example, lowered resistance to infection, chronic arthritis, dental caries and rheumatic fever.

3 Complex artificial mixtures of vitamins together with other substances, often referred to as "shotgun vitamin preparations," should not be accepted without convincing clinical evidence of their value, and of the necessity for them.

4 Vitamin preparations made by new or unusual methods should be accepted only when biologic assay and clinical data establish their activity.

The Council adopted the report of the referee as an expression of the policy of the Council in reference to the clinical testing of vitamins in vitamin-containing preparations.

*Series of Articles on Vitamin Preparations*—The Council voted that in cooperation with the Committee on Foods there be appointed an editorial committee under whose supervision there will be devised a contemplated series of articles on vitamins.

*Allowable Claims for Vitamins*—The Council discussed the statement on the allowable claims for vitamins. This statement has been discussed elsewhere. (See THE JOURNAL, May 16, 1936, p. 1732.)

The Council also considered the matter of dosage of cod liver oil for infants and lay advertising of vitamin-containing preparations. (See THE JOURNAL, May 16, 1936, p. 1732.)

*Liver Preparations*—The Council again considered the matter of the labeling and marketing of liver preparations. The consensus of the Council was that the published statement on labeling has been found satisfactory (THE JOURNAL, Oct. 19, 1935, p. 1269). In view of present evidence the Council maintained the opinion that the guinea-pig test that has been proposed by certain investigators is not practical for purpose of N. N. R. standards.

*Articles on Glandular Physiology and Therapy*—It was reported that approximately 1,500 copies of the book "Glandular Physiology and Therapy" had been sold up to March first and that requests had been received from nine countries for privileges of translation.

A progress report was also made of the work being done by the Advisory Committee on the Nomenclature of Endocrine Principles. The reports formulated by this committee are to be published shortly. (See this issue, p. 1808.)

*Therapeutic Research*—The chairman of the Committee on Therapeutic Research, Dr. C. W. Edmunds, reported in detail the work done by that group during the past year. The committee has continued to follow the previous policy of granting a sum generally between \$100 and \$200 for the purchase of special material as an aid in fostering research. The number of applications considerably exceeded the number of grants that could be made. The Council voted that the report of the committee be received and adopted and that appreciation be expressed to the members of the committee for the excellent way in which their work was carried out.

*Aminophylline Preparations*—The minutes of the annual meeting of the Council for 1935 carried the following statement:

*Advertising for Aminophylline*—The Council discussed the difficulty in determining the exact clinical status of Aminophylline. It felt that some advertising claims for the product carried overoptimistic implications.

After extensive discussion the Council adopted the following statement:

It has been claimed that in certain cases relief of pain has followed the use of theophylline preparations in cardiac conditions. The evidence that this was due to the theophylline is not convincing, and there is no evidence that the improvement, if it occurred, was due to coronary dilatation.

The claims in the advertising of accepted products of aminophylline will therefore be judged in accordance with this decision.

*Sterility of Catgut Sutures*—The committee of the Council on Pharmacy and Chemistry in charge of the investigation of catgut sutures presented a progress report of the work under way. It is anticipated that the results of the investigation may be available within the next nine months.

*The Nomenclature of Bacteriologic Products*—The Council voted (a) that the Council recognize as acceptable for the nomenclature of bacteria the generic names proposed in the final report of the committee of the Society of American Bacteriologists on characterization and classification of bacterial types (J. Bact. 5:191, 1920); (b) that these names be used in New and Nonofficial Remedies and other publications of the Council; (c) that the use of "common names" not used in a generic sense, and the use of newer names for subdivisions of the genus *Bacterium*, be also permitted, and (d) that this action shall not preclude the use of names of products required in government licenses when used on package labels, package enclosures, advertising, reports of the Council, or as headings for descriptions of products in New and Nonofficial Remedies, provided such names are followed by names acceptable to the Council.

*Ergot*—There was summed up for the Council the present situation with reference to the new alkaloid of ergot. The four investigators, each of whom independently discovered an alkaloid of ergot, published a statement (Science 83:206 [Feb. 28] 1936) that their products were identical. In view of this, the Council deemed it necessary to coin a new nonproprietary and not therapeutically suggestive name for the ergot alkaloid—"Ergonovine." The action of the Council was published in THE JOURNAL, March 21, 1936, p. 1008.

*Personal Endorsement Signatures*—On one or two occasions pharmaceutical houses have issued products bearing the personal endorsement signature of a physician. This was particularly flagrant in the case of an imported product. The Council therefore adopted the following amplification of rule 6:

The use of the personal signature of a physician, or the facsimile of such signature on the label or in advertising of products, is objectionable because it tends to create, through the implication of personal supervision, an exaggerated or misleading impression of therapeutic value, and articles so labeled or advertised are therefore not acceptable.

*Injection Solutions for Hernia*—The referee in charge of the consideration of injection treatment of hernia reported the results of a questionnaire that had been sent to certain hospitals and individuals. The referee reported that the evidence submitted to date is not conclusive.

The Council voted that the referee prepare a report on the present status of the injection treatment of hernia for submission to the Council with a view to ultimate publication.

*Hospital Practice for Interns*—It was decided to revise radically the book "Hospital Practice for Interns" during the summer of 1936.

*Status of Bismuth Preparations*—The referee in charge of bismuth preparations presented the following statement:

There are many different types of bismuth preparations that are used, and with all of them the object of the injection is so to raise and maintain the level of metallic bismuth in the blood stream that it will function as an active antisyphilitic agent. With the water soluble preparations this will require the injections being given every day or every other day or every third day. With the insoluble agents and with the oil soluble preparations, on the other hand, this level is gained and can probably be maintained by injections once a week or every five days at the least.

To any one it is at once evident that the number of bismuth salts possibly therapeutically useful that might be tried for treating syphilis is legion. Thus the article on bismuth in the Jadassohn Handbuch of 1928 already mentioned 112 different or allied preparations. When one considers the many and varied preparations of bismuth, one may realize the temptation presented to the manufacturer to introduce another "new" bismuth compound. It is much like the problem of the barbiturates. It is true that now and then the pharmacologist may evolve a new product along a new line and furnish something worth while.

On the other hand, the referee can see great confusion and little help to general practice if the manufacturers continue simply to turn out "another bismuth compound." It is believed the Council should go on record as discouraging such practices unless the product produced is actually a new approach to the problem offering actual selective action, a higher chemotherapeutic quotient, or some other outstanding advantage over products already on the market.

The Council voted that after July 1, 1936, the Council consider no new bismuth preparations unless they show some distinctive advantages over those already accepted.

*Labeling of Products Subject to Deterioration*—The Council had before it a preparation claimed to contain 4.05 per cent sodium hypochlorite when actually it was prepared with a

concentration of 4.50 per cent in order to allow for the deterioration during the year. The label in addition contains a statement that 12 per cent should be allowed for deterioration during the year.

The Council believed that the product should be labeled at whatever concentration it is proposed to make it at the time it is placed on the market and that on the label there be a supplemental statement of dating and rate of deterioration.

The Council adopted a motion that any products of this sort be labeled with a statement of the composition at the time it leaves the manufacturer, and is dated; furthermore, in case the product deteriorates or is subject to deterioration, that a supplemental statement be made as to the amount and/or rate of deterioration, either by indicating the percentage of deterioration per year or the actual minimum amount at the end of the year.

**Reports of Committees on Publications of the Council on Pharmacy and Chemistry.**—The Council considered the report of the Committee on Epitome of the Pharmacopoeia and National Formulary and the Committee on Useful Drugs. It was announced that the Epitome had been revised in accordance with the new edition of the Pharmacopoeia and the National Formulary and would be available approximately May 1.

New and Nonofficial Remedies has also been revised to bring it in accordance with the new official compendium. It should be available about the middle of June.

The manuscript for Useful Drugs has been sent to the printer and the book should be available in early summer.

## REPORTS OF THE COUNCIL

### Nomenclature of Endocrine Principles: I.

THE PRESENT UNSETTLED STATE OF ENDOCRINOLOGICAL NOMENCLATURE HAS BEEN THE CAUSE OF INCREASING CONFUSION IN RECENT YEARS. IN AN EFFORT TO REMEDY THIS DEPLORABLE SITUATION, THE COUNCIL SOLICITED THE COOPERATION OF A NUMBER OF EXPERTS WHO HAVE MADE FUNDAMENTAL CONTRIBUTIONS TO GLANDULAR PHYSIOLOGY. THIS GROUP, TERMED THE ADVISORY COMMITTEE ON THE NOMENCLATURE OF ENDOCRINE PRINCIPLES, IS COMPOSED OF THE FOLLOWING: DRs. EDGAR ALLEN, WILLARD M. ALLEN, J. B. COLLIP, G. W. CORNER, E. A. DOISI, E. T. ENGLE, H. M. EVANS, R. T. FRANK, F. L. HISAW, F. C. KOCH, LEO LOEB, G. F. MARRIAN, C. R. MOORE, OSCAR RIDDLE, P. E. SMITH AND G. W. TURNER; M. S. BISKIND, CORRESPONDING SECRETARY. ON THE RECOMMENDATION OF THIS COMMITTEE, THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT. IT IS ANTICIPATED THAT OTHER REPORTS ON RELATED TOPICS WILL BE PUBLISHED IN THE NEAR FUTURE.

THE COUNCIL DESIRES TO EXPRESS ITS SINCERE APPRECIATION TO THE MEMBERS OF THE ADVISORY COMMITTEE FOR THEIR WILLING COOPERATION.

PAUL NICHOLAS LEECH, Secretary.

### THE NOMENCLATURE OF THE CORPUS LUTEUM HORMONE

1. The Advisory Committee on the Nomenclature of Endocrine Principles has considered the question of choosing an appropriate name for the one definitely established hormone of the corpus luteum. This hormone is defined and quantitatively estimated by its property of acting on the rabbit's uterus to produce histologic changes (progestational changes) resembling those observed during early pregnancy and pseudopregnancy.<sup>1</sup> It has been demonstrated and agreed that the chemical structure of this substance is represented by the formula given herewith, and that no other natural substance has as yet been found having the same physiologic properties.

2. Crude extracts containing the hormone were produced in 1928 by Hisaw, Meyer and Weichert<sup>2</sup> of the University of

Wisconsin, and in 1929 by Corner and W. M. Allen<sup>3</sup> of the University of Rochester. The quantitative test now in general use was published by Corner and Allen at this time. Subsequent steps of purification were made by W. M. Allen<sup>4</sup> (1930, 1932), by Fevold, Hisaw and Leonard<sup>5</sup> (1932) and by Allen and Meyer<sup>6</sup> (1933) and the preparation of the hormone in crystalline form was announced in 1934 by Butenandt, Westphal and Cobler<sup>7</sup> of Danzig, by Slotta, Ruschig and Blanke<sup>8</sup> of Breslau and by W. M. Allen and Wintersteiner<sup>9</sup> of Rochester and New York, respectively. Complete determination of the structural formula and the earliest method of artificial preparation were published by Butenandt<sup>7</sup> in 1934.

3. A long period elapsed between the demonstration by Ludwig Fraenkel<sup>10</sup> in 1903 and by Leo Loeb<sup>11</sup> in 1907 that the corpus luteum has an endocrine function and the preparation of active extracts. During this time crude preparations of the corpus luteum for oral use were in vogue and various names such as lutein were current, were made the basis of trade names, and crept into the medical dictionaries.

4. To indicate and emphasize the existence in the early crude extracts of an active substance having the property defined, the name *progestin*, coined by G. W. Corner, was introduced by W. M. Allen<sup>4</sup> in 1930. The name *corporin*, coined by F. L. Hisaw,<sup>5</sup> appears to have been used in print first in 1932.

**Progestin.** Etymology: *pro-*, prefix meaning in behalf of or favoring, *gestatio*, gestation; and *-in*. The word signifies a chemical substance useful in gestation. It is defined in the American Illustrated Medical Dictionary as "a hormone contained in the corpora lutea, whose function is to prepare the endometrium for the reception and development of the fertilized ovum." The word has been widely used in American scientific and clinical literature and in England. Spelled *progestine*, it has had moderate use in France. In Germany it has been little used.

**Corporin.** Etymology, from *corpus*, body, and *-in*, suffix indicating a chemical substance. The word therefore signifies a substance having to do with a body (i. e., the corpus luteum). It is defined in the American Illustrated Medical Dictionary as "same as *progestin*." The word has been used to some extent in the American literature but appears not to have been used in other countries.

5. Since the determination in 1934 of the chemical nature of the hormone, American writers have usually continued to refer to the pure substance by the name *progestin*. Slotta and his co-workers, however, introduced the word *luteosterone*.

**Luteosterone.** Etymology: from *luteum*, yellow, referring to the corpus luteum; *sterol*, name of a class of chemical substances, and the suffix *-one*, indicating that the particular substance is a ketone. The

Entwickl. med.* 27: 89 (Jan. 12) 1909, 31: 456 (Feb. 14) 1911, 32: 67 (May 16) 1911.

word signifies therefore the ketone of a sterol derived from the corpus luteum. Philologists unfamiliar with its history might, however, interpret it to mean simply a yellow ketosterol.

6 In the spring of 1934 the European biochemists who had so largely taken part in the solution of the chemical problems concerned pointed out that in their opinion the word progesterin is not sufficiently indicative of the exact chemical structure of the substance to be used conveniently in the literature of organic chemistry. It appears, moreover, to have been adopted as a manufacturer's name for certain partially purified commercial extracts, sold in Europe. After correspondence and personal conference, the following letter<sup>12</sup> was drawn up by Butenandt, and signed as noted herewith. Wintersteiner also gave assent to the document, although his name does not appear among the signers. The letter appeared in several scientific publications in England, Germany and the United States as indicated.

During the past year the progestational hormone has been isolated from the corpus luteum in pure form and its constitution established. Heretofore two different names have been used for this hormone in the literature (progesterin, luteosterone). For the sake of international uniformity we agree to use hereafter in the scientific literature only the name *progesterone* for the pure hormone. As is known, the pure hormone exists in two different forms, one melting at 128° (uncorr.) and the other at 121° (uncorr.). The higher melting form (Compound B of Wintersteiner and Allen [1934] and Compound C of Slotta, Ruschig and Fels [1934]) will be known as a progesterone and the lower melting compound (Compound C of Wintersteiner and Allen and Compound D of Slotta, Ruschig and Fels) as  $\beta$  progesterone. We hope that these names will be generally accepted in the scientific literature.

7 On the recommendation of the Advisory Committee, the Council adopted the following terms: (1) *progesterone* to indicate the chemically pure substance having the structure and properties named in paragraph 1, (2) *progestin* as a general term to indicate the substance (and other chemically allied substances having similar action, in case any such compounds are subsequently discovered) without reference to the state of chemical purity, for convenience in clinical and biologic speech and writing.

## NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

PAUL NICHOLAS LEECH, Secretary

### SCARLET FEVER IMMUNITY TEST.—(See New and Nonofficial Remedies, 1935, p. 411)

United States Standard Products Company, Woodworth, Wis.

*Scarlet Fever Streptococcus Toxin for the Dick Test*—Prepared by the method of Drs. Dick, under U. S. patent 1,547,369 (July 28, 1925, expires 1942) by license of the Scarlet Fever Committee, Inc. Marketed in packages of one ampule containing sufficient toxin for ten tests, and in packages of one vial containing sufficient toxin for 100 tests.

### MERCURY SALICYLATE (See New and Nonofficial Remedies, 1935, p. 308)

The following dosage form has been accepted:

*Ampules Mercury Salicylate 1 grain (0.065 Gm.) Suspended in Oil 1 cc.* Each 1 cc. ampule contains mercury salicylate 1 grain (0.065 Gm.) quinine and urea hydrochloride 0.05 Gm. anhydrous wool fat 0.1 Gm., distilled water 0.05 cc. and Wesson oil (maize oil) to make 1 cc.

Prepared by the Cheplin Biological Laboratories Inc., Syracuse, N. Y.

### PROTARGOL (See New and Nonofficial Remedies, 1935, p. 416)

The following dosage form has been accepted:

*Granules Protargol Compound*—Protargol 33½ per cent, and urea, 66½ per cent. The urea is added because of its effect of increasing the solubility but is otherwise inert.

## Committee on Foods

### ACCEPTED FOODS

THE FOLLOWING PRODUCTS HAVE BEEN ACCEPTED BY THE COMMITTEE ON FOODS OF THE AMERICAN MEDICAL ASSOCIATION FOLLOWING ANY NECESSARY CORRECTIONS OF THE LABELS AND ADVERTISING TO CONFORM TO THE RULES AND REGULATIONS. THESE PRODUCTS ARE APPROVED FOR ADVERTISING IN THE PUBLICATIONS OF THE AMERICAN MEDICAL ASSOCIATION, AND FOR GENERAL PROMULGATION TO THE PUBLIC. THEY WILL BE INCLUDED IN THE BOOK OF ACCEPTED FOODS TO BE PUBLISHED BY THE AMERICAN MEDICAL ASSOCIATION.

FRANKLIN C. BING, Secretary

DURKEE'S BRAND OLEOMARGARINE  
DURKEE'S BO-KAY BRAND OLEOMARGARINE  
DINNER BELL BRAND OLEOMARGARINE  
MY OWN BRAND OLEOMARGARINE  
TASTI-BRAND OLEOMARGARINE  
TROCO BRAND OLEOMARGARINE

*Manufacturer*—Durkee Famous Foods, Inc., Chicago

*Description*—Oleomargarines prepared from refined coconut oil, pasteurized cultured milk, refined cottonseed oil, salt, mono-stearyl sodium sulfoacetate, and sodium benzoate (0.1 per cent).

*Manufacture*—Essentially the same as described for Durkee's Vegetable Oleomargarine (*THE JOURNAL*, Aug. 3, 1935, p. 369).

<i>Analysis</i> (submitted by manufacturer) —	per cent
Moisture	15.4
Ash (other than sodium chloride)	0.1
Sodium chloride	3.2
Fat (ether extract)	80.3
Protein (N × 6.25)	0.5
Lactose	0.6
Sodium benzoate	0.1
Glycerin derivative	0.4

*Calories*—7.3 per gram, 207 per ounce

*Claims of Manufacturer*—For use as a bread spread and in cooking, baking and frying.

### CELLU BRAND PEAS, WATER PACKED

*Distributor*—Chicago Dietetic Supply House, Inc., Chicago

*Packer*—Valders Canning Company, Valders, Wis.

*Description*—Canned peas, packed in water.

*Manufacture*—Selected peas are harvested at the desired degree of maturity, vined, washed, graded for size, inspected, blanched, again washed, and automatically filled into cans. The cans are filled with water, sealed and processed.

<i>Analysis</i> (submitted by distributor) —	per cent
Moisture	88.7
Total solids	11.3
Ash	0.4
Fat (ether extract)	0.2
Protein (N × 6.25)	3.1
Crude fiber	0.8
Starch (diastase method)	5.4
Carbohydrates other than crude fiber (by difference)	6.8

*Calories*—0.4 per gram, 11 per ounce

*Claims of Manufacturer*—Small, sifted, young, tender peas, packed without sugar or salt. For use in special diets in which sugar or salt is proscribed, or in quantitative diets of calculated composition.

### AVONDALE FARMS PASTEURIZED HOMOGENIZED MILK

*Distributor*—Avondale Farms, Knoxville, Tenn.

*Description*—Bottled, pasteurized, homogenized milk.

*Preparation*—Milk obtained from tuberculin tested herds under government and company inspection is pasteurized by the standard holding method (63 C. for thirty minutes), homogenized at 3,000 pounds pressure, cooled to 3 C. and automatically filled in bottles by the usual procedure (*THE JOURNAL*, Sept. 1, 1934, p. 681).

*Analysis*—Standardized to contain not less than 4.2 per cent of milk fat.

*Claims of Manufacturer*—The cream does not separate. The curd formed in the stomach is softer than that from unhomogenized milk.

SATURDAY, MAY 23, 1936

## THE KANSAS CITY SESSION

The annual session of the American Medical Association, held in Kansas City last week, was extraordinarily successful from many different points of view. The attendance was well beyond that anticipated. The weather during the entire week was ideal. The new municipal auditorium is conveniently arranged, beautiful in its appointments, and impressive in its appearance. The physicians and the people of Kansas City provided a welcome and an intimate type of hospitality quite distinctive for an occasion of this character.

The House of Delegates was particularly concerned in this session, as will be seen from its proceedings, with the relationships of physicians to hospitals, with the new experiments that are being undertaken in changing the nature of medical practice, with the status of prevention of conception, and with raising still further the standards of medical education and medical ethics. Its sessions were harmonious; the Board of Trustees and executives of the Association received special commendation for their efficiency in the conduct of the affairs of the Association. These affairs are ever widening in their scope and in the extent of the service rendered to the medical profession.

The opening general meeting was unique in several ways. First, the President-Elect who was to have been installed was unfortunately so seriously ill as to be unable to attend the meeting. He was therefore, by special action of the House of Delegates, installed in absentia. The governors of two great states, Missouri and Kansas, attended in person and delivered messages of welcome. Governor Park of Missouri spoke, briefly welcoming the visiting physicians. The great arena of the auditorium was filled with some 12,000 to 14,000 listeners who stood unanimously in response to a thrilling announcement by Governor Alfred M. Landon indicating his opposition to regimentation of the medical profession. Governor Landon said in part:

From the earliest days the general practitioner in America was, first of all, an individualist. The circumstances of his work made him that; but it was a fortunate situation for the

people who needed medical care. It meant that they could have personal ministrations, that there was an intimate relationship between physician and patient and that the sufferer became at once, and remained, the object of very special attention.

Down to the present day American medicine has continued to be primarily individualistic. It is chiefly on that basis that it is to be distinguished from medicine in many foreign countries. I know very well the arguments for an extension of the best of medical service to all groups of the American people. It is a worthy cause. It is enlisting the attention of the best brains of your profession. I have confidence that you will work it out.

But medicine will not willingly be made the servile instrument of politicians or the instrument of domineering bureaucracy. I predict that the typical American physician and organized medicine as a whole will at no time be ready for any scheme of regimentation, for any system of impersonalized medicine which is totally alien to the best traditions of the American practitioner and of the profession as a whole.

The American practitioner will not be a party to destruction of that individual, personal service which has been the occasion of a special and justifiable pride. Whatever further advances are made in the broadening of medical service—and there will be an abundance of them—will be made, so far as he is concerned, in accordance with the fundamental conditions of previous achievements.

I want especially to approve the efforts for meeting its responsibilities of the Jackson County Medical Society as mentioned by its president. A nation that can maintain and even elevate its medical standards and the state of public health in the trying years of a prolonged depression needs to make no apology for the quality and the reach of its medical facilities.

That condition itself is a tribute to the American physician in his continued, unselfish devotion to a worthy task. May you long abide in your loyalty to the ideal of individual, personal ministrations.

The general scientific meetings attracted great audiences, particularly the lecture by Lord Horder on thyrotoxicosis and the motion picture exhibition by Dr. Joseph B. De Lee. The latter drew a capacity audience. The distinguished guests of the Association from abroad included not only Lord Horder but also Leon Ascher of Switzerland and Wolfgang Heubner of Berlin. The meetings of the various sections took place in beautiful and well appointed halls. Many physicians remarked on the utility and practical character of the contributions. As in previous years, the Scientific Exhibit produced a great number of demonstrations. The types of material exhibited were varied, and throngs of physicians assembled in the various booths in such numbers as to block the aisles completely on many occasions. The awards of medals and certificates of merit indicate the character of the scientific contributions.

A special feature of the Kansas City session which attracted attention was the efficient manner in which the local organization had bound the meeting closely into the lives of the public. Every service club, educational organization and forum in the city opened its doors to medical speakers. There were local and national broadcasts in profusion, indicating to the public the advances in medicine. Furthermore, the press, both local and national, surpassed all previous efforts in its coverage, the press representatives in attendance including not only some twenty-four reporters and photographers from the local newspapers but also three

representatives of the Associated Press, three from the United Press, one from the International News, one from Universal Service, one from Science Service, one from the North American Newspaper Alliance, one from the New York *Herald Tribune*, one from the New York *Times*, one from the Philadelphia *Inquirer*, one from the Chicago *Tribune*, and several representing other periodicals.

The Woman's Auxiliary registered a great attendance and held numerous sessions, both social and organizational. The social events included the special dinner for the House of Delegates and officers on Monday night, the opening general meeting Tuesday night, innumerable fraternity and alumni meetings on Wednesday, and the "Bring Your Husband Dinner" and annual reception and dance on Thursday night. All these events had capacity attendance. They were perfectly planned, exactly timed and conducted with a facility which indicated the experience of the Kansas City profession in the conduct of medical meetings. Indeed, the outstanding feature of the session was the manner in which the Kansas City medical profession *en masse* united in doing its utmost to make the session a success. The local committees were constantly in evidence, moving the affairs with precision and making the stranger feel at home within their gates. The departing physicians expressed almost universal satisfaction. Many already await an opportunity to return and to partake again of one of the most friendly and efficient receptions ever accorded to any great convention of the American Medical Association.

JOHN HOWELL JANEWAY UPHAM, M.D.  
PRESIDENT ELECT OF THE AMERICAN MEDICAL ASSOCIATION

#### SMALLPOX IN THE UNITED STATES

According to reports from twenty-six countries to the League of Nations from 1921 to 1930, the United States showed the second highest reported attack rate of smallpox. This is a striking and, at first thought, a wholly unexpected observation. The statement by itself is somewhat misleading, as brought out in a study of the incidence and fatality of this disease.<sup>1</sup> The apparent

high incidence in this country is due in part to a better system of reporting cases in the United States than in other countries and in part to the fact that the strain of smallpox endemic in this country is of a mild variety which is difficult to control because of the lack of general interest in prophylactic treatment. As might be expected, in countries in which the malignant form predominates, the stimulus to secure general protection by vaccination is greater and hence the control of the disease is more effectively accomplished. Although the incidence of smallpox in this country is high, the fatality rate in comparison with that of most other countries is exceedingly low. Nevertheless, the high attack rate indicates the need of a critical appraisal of the situation and the formulation of plans for more adequate control.

The comparatively high incidence of smallpox in this country, according to the survey referred to, is due primarily to the relatively low endemic vaccination rate. The mild type of the disease is thus permitted to maintain itself. This explanation obviously suggests a procedure for the control of the condition; namely, a general increase in vaccination against smallpox. Experience has demonstrated that vaccination is exceedingly effective. As is shown in the League of Nations review, the well vaccinated countries have low attack rates, whereas the opposite is true in poorly vaccinated countries. Apparent exceptions to this rule are found in the cases of Australia

and New Zealand. However, the low incidence of smallpox in these countries can be explained by their geographic isolation and constant vigilance at the ports of entry to prevent the introduction of the disease from other countries. The apparent efficacy of this measure suggests that the procedure should be more vigorously practiced in this country. Careful investigations here have shown that epidemics of the malignant form of smallpox have been started in many instances by infected immigrants, particularly by smuggled labor from Mexico and other countries. Also the vagrant, migratory laborer and people from unvaccinated rural regions have been influential in the spread of smallpox within the boundaries of our own country. An excellent example of this is seen in the increased incidence

1. Hedrich, A. W.: Changes in the Incidence and Fatality of Small pox in Recent Decades, *Pub Health Rep* 51:363 (April) 1936

of smallpox during times of prosperity when there is an intensified migration to industrial centers from rural districts. The opposite tendency may account in some measure for the decline of smallpox during the recent economic depression.

The foregoing facts unquestionably indicate the need for a more widespread vaccination against smallpox in this country and for greater vigilance not only to minimize the spread of the disease from section to section but particularly to prevent the entrance of the malignant form from foreign countries.

### THE EVOLUTION OF DISEASES

The life history of a disease is often like that of a human being. Its weak or lusty infancy is at first greeted with mild speculation. As it gradually grows it develops the proportions of a young adult and abundant vigor. Finally, after varying periods of strength, the old age and decline of a disease may begin to occur. In some instances it finally disappears. Riesman<sup>1</sup> has recently discussed a number of the dead or dying diseases. Among those which are no longer mentioned is the so-called sweating sickness, which apparently first appeared in England after the battle of Bosworth in 1485. It caused a short rigor followed by severe perspiration, headache, stupor and epigastric pains. The whole body was bathed with fetid perspiration. The crisis was over within the short space of forty-eight hours. Scarcely one in a hundred escaped. Several epidemics of this strange disease seem to have swept over England in the reign of Henry VIII. It apparently did not spread to Scotland, Ireland or Calais, but Hamburg was visited by the sweating sickness in 1529. Within twenty-two days, 1,100 inhabitants of Hamburg died.

Another disease which is now not recognized, at least by the same name, is the petechial fever of Italy. It was described by Fracastoro as the first plague of the kind to occur in that country. Those who were affected with this condition "lay upon their backs with an oppressed brain, blunted senses, delirious, with blood-shot eyes." Between the fourth and the seventh day of this illness, purple spots like flea bites or larger broke out. It was not especially contagious and did not seem to be carried by fomites. Tarantism was another curious disease of the Middle Ages which is now apparently nonexistent. It was believed by many to result from the bite of a spider. A few hours after the bite "the patient is seized with great difficulty of breathing, a heavy anguish of heart, a prodigious sadness, his voice is sorrowful and querulous, his eyes disturbed." Often after the violent symptoms were over the patients were affected with a peculiar kind of melancholy, which continued until "by dancing or singing or change of air those violent impressions are quite extricated from the blood and the fluid of the nerves." What this strange

condition was no one even today seems quite certain. It has been suggested by Professor Sigerist, however, that tarantism was a revival of the Dionysiac cult of Magna Graecia.

The dancing mania, which also broke out in various regions throughout the Middle Ages, is now no longer common. Sometimes St. Vitus' dance or chorea was probably at the root of the term; much more often mass hysteria was probably responsible; sometimes it may have been due to diseases that find no counterpart today.

Many other diseases which a few centuries ago must be considered to have been in their prime are still present today but in attenuated form, lacking much of the highly fatal and spreading qualities which they once possessed. The decline in these diseases is probably due to several factors, including improved sanitation and medical knowledge, but also probably to the natural life history of the disease. The bubonic plague, which spread over Europe as the black death on many occasions, has not for some centuries reached such serious proportions in civilized countries. Defoe's *Journal of the Plague Year*, the literary as well as the medical qualities of which recommend it to all medical men, illustrates only too well the severity which a disease can take in its prime. It is possible, furthermore, that the plague may yet show sufficient life to invade civilized communities once more in epidemic proportions. Leprosy, which in the Middle Ages was one of the most dread diseases, has in most countries become a relative rarity. It will probably never again terrify the world as it has in the past. Chlorosis, on which Fowler<sup>2</sup> has recently written an obituary, is no longer the common disease it used to be. With present knowledge of etiologic factors in chlorosis, it is especially interesting to read of the old ideas that this condition was due to love sickness. Ergotism, or St. Anthony's fire, which was due to the eating of bread made from diseased grain, is now almost extinct.

In relatively recent years there has been definite evidence of a decline in frequency of a large group of other diseases. Typhoid, tuberculosis, diphtheria and probably syphilis are less frequent or less generally virulent than some one or two hundred years ago. Part of this change must be assigned to sanitary measures and improved treatment, but part, especially for syphilis and probably diphtheria, may be due to increased race resistance and natural decline of virulence, which might be expected after vigorous flourishing for several centuries.

Among the new diseases, at least from the standpoint of their definite recognition, are psittacosis, tularemia and spirochetal jaundice. It is yet impossible to say whether these and like diseases will die in infancy or attain full growth with wide invasion. It is perhaps possible to say that, of these, spirochetal jaundice is the most likely to become widespread.

2. Fowler, W. M.: Chlorosis—An Obituary, *Ann. Med. Hist.* 8: 168 (March) 1936.

## Current Comment

### JOHN HOWELL JANEWAY UPHAM, PRESIDENT-ELECT

When Dr. John Howell Janeway Upham was elevated to the position of President-Elect of the American Medical Association by the House of Delegates at the session in Kansas City, it recognized a career of distinguished service in organized medicine marked by devotion and success. The President-Elect was born at Trenton, N. J., Aug. 12, 1871. After his preliminary education he attended the University of Pennsylvania, where he received the certificate of biology in 1891.

His medical degree was awarded in 1894 in a class which has contributed other notable members to high places in the American Medical Association. Following an internship at the Johns Hopkins Hospital in Baltimore from 1894 to 1896, Dr. Upham took up the practice of medicine at Columbus, Ohio. He married Alice Lee of that city in June 1897. He served as instructor of medicine at Starling Medical College from 1897 to 1902 and during that time took post-graduate work at Prague, Leipzig and Berlin. From 1902 to 1908 he was associate professor of medicine in Starling (Ohio) Medical College and then became professor of medicine and clinical medicine. This position he held until 1914, when he was appointed professor of medicine at Ohio State University College of Medicine. Since 1927 he has been dean of the medical school of Ohio State University. In civic affairs he has occupied the position of member of the Ohio State Medical Board since 1913. In 1922 he was on the Advisory Committee of the American Red Cross. In the Ohio State Medical Association he served as secretary-editor from 1907 to 1913, president in 1914-1915, and since that time has been chairman of the Legislative Committee. In the American Medical Association Dr. Upham served on the Judicial Council for a term beginning in 1922, and he was for twelve years a member of the Board of Trustees, becoming chairman of the Board in 1933. In all the affairs of the Association in which he has taken such a prominent part he has made an efficient contribution, giving freely of his time and his ability. No

election to the highest office in the gift of the Association could be more fitting than this recognition of John H. J. Upham.

### J. TATE MASON AND THE VICE PRESIDENT, CHARLES GORDON HEYD

Over the success, the brilliance and the happiness of the Kansas City session lay the dark shadow of the serious illness of the President-Elect—now installed as President of the American Medical Association—Dr. James Tate Mason of Seattle. Culminating a year in which he traveled widely and spoke much on behalf of organized medicine, he became ill with a severe involvement of his circulatory system, resulting eventu-

ally in multiple emboli which occluded blood vessels in the legs and also in the brain. At the time of this writing he has already suffered gangrene of the left extremity requiring its removal, complete paralysis of the left side and a gradually advancing gangrene of the right leg and thigh. Notwithstanding this terrible illness as well as deaths among members of his family, he sent encouraging messages to the House of Delegates which will be found in its proceedings, and he telegraphed his personal appointments to fill vacancies in the councils of the Association. In view of the serious character of his illness and the certainty that the Vice President under the By-Laws of the Association will be compelled to officiate in the place of the President during most of the term, the choice of a Vice President was especially significant. For this position the House of Dele-

CHARLES GORDON HEYD, M.D.  
VICE PRESIDENT OF THE AMERICAN MEDICAL ASSOCIATION

gates chose Charles Gordon Heyd of New York, at present professor of surgery in the Post-Graduate Medical School and Hospital of Columbia University, consultant surgeon at the Women's Hospital and trustee of the Medical Society of the County of New York, and a distinguished contributor to the literature of surgery. Dr. Heyd has been president of the New York State Medical Society and as chairman in charge of arrangements for the last annual session of that association revealed an executive capacity extraordinary among practicing physicians. By his election the Association is assured a distinguished leader, a forceful speaker, and a genial physician to serve in the place of its President when the emergency arises.

# PROCEEDINGS OF THE KANSAS CITY SESSION

MINUTES OF THE EIGHTY-SEVENTH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD AT KANSAS CITY, MAY 11-15, 1936

## HOUSE OF DELEGATES

### *First Meeting—Monday Morning, May 11*

The House of Delegates convened in the Ballroom of the Hotel Muehlebach and was called to order at 10 a. m. by the Speaker, Dr. N. B. Van Etten.

#### **Preliminary Report of the Reference Committee on Credentials**

A preliminary report of the Reference Committee on Credentials was submitted by the chairman, Dr. J. D. Brook, Michigan, who reported that 153 delegates with proper credentials had registered. There being no regularly elected alternate from Illinois able to attend, Dr. Brook recommended the seating of Dr. Harold M. Camp, Illinois, in place of Dr. C. E. Wilkinson, who was not in attendance.

On motion of Dr. Brook, seconded by Dr. John Z. Brown Sr., Utah, and carried, the report of the Reference Committee on Credentials was adopted.

The Speaker declared that the roll call would be dispensed with and that the signed attendance slips would constitute the roll of the House for the morning.

#### **Adoption of Minutes of Atlantic City Session**

It was moved by Dr. McLain Rogers, Oklahoma, seconded by Dr. H. B. Everett, Tennessee, and carried, that minutes of the Atlantic City session be adopted as printed.

#### **Address of the Speaker, Dr. N. B. Van Etten**

The Vice Speaker, Dr. H. H. Shoulders, Tennessee, presided while the Speaker, Dr. N. B. Van Etten, read his address, which was referred to the Reference Committee on Reports of Officers:

#### *Members of the House of Delegates:*

You have been selected by your state societies to carry to this body the opinions of your constituents, the opinions of your county medical societies, the opinions of your individual members. As selected representatives you will fail in your duty if you sit silently because of diffidence or disinterest. Members who are here for the first time may fear to express themselves because they are unfamiliar with our procedure. May I assure them that they will not fail of recognition or of opportunity so long as they discuss the problems which are before the House and remain within reasonable parliamentary bounds. You are the policy makers of this democratic organization, and not only does the country look to you for constructive action which shall reflect the progressive sentiment of American medicine, but your constituents in turn look to you for an interpretation of the quality of that sentiment. It is not the function of your Speaker to recommend action of any kind, but it is within his privilege to urge you to exercise all of your constitutional privileges and to function as fully as your ability permits. *Laissez faire* is a worn out phrase but it is still stupidly employed by far too many physicians. This is not a specific criticism of this body only, but a legitimate criticism of a very large body of our citizenship. It is lamentable that the physicians of the United States, who constitute the most highly educated professional group of any country, fail so miserably in the exercise of citizenship. James Bryce listed as hindrances to citizenship "indolence, private self interest, and party spirit." Inflexible party spirit, which sees no virtue in those who have other affiliations, is essentially obstructive. Private self interest, which denies any generous inquiry into the reasonableness of

other people's thinking, shuts the door in the face of progress. Indolence, disinterest, disinclination to help oneself, and avoidance of responsibility, failure to support those who are striving for the common good, are a hindrance to citizenship. Membership in the medical profession does not excuse any failure to function in the social or community life of the nation.

Every physician should employ all his abilities in the promotion of the public health. Every physician is politically potential. Every physician will find responsive hearing in every home which he visits if he will take the trouble to educate himself sufficiently to be able to discuss intelligently matters of local or national polity which concern the health of the community. He must acquire much more than a superficial knowledge of political machinery and must take his place therein. Dignified aloofness is stupidity dictated by laziness. The medical citizen of this type deserves nothing from our people and his profession will sink into economic slavery if he is allowed to direct it. Your Speaker would like to hope that this House of Delegates may be so stimulated by lively discussion that awakening messages may be carried home to all the physicians of this country. Your Speaker desires that every question shall be thoroughly debated in order that a reliable consensus may emerge. You will recall a recent special session of the House at which a unanimous action was taken. Although the Speaker, on that occasion, gave every possible freedom and latitude for personal expression, it seems evident that divergent sentiment which existed at that time, in that House, failed to be expressed. Ill advised or malicious critics frequently accuse the American Medical Association of failure to represent American medicine. These critics claim that a small group of officers is responsible for originating and propagandizing reactionary and obstructive policies. If the Association is not progressive, or sympathetically meeting social currents, the responsibility rests on the House of Delegates. You are responsible to American medicine and to the country for everything that is done by the administration. If your officers fail to carry out your mandates you may choose others, but your responsibility is fundamental. More than any other group, you are American medicine. The questions brought before you should be considered with the unequivocal thought that you are writing important social history. You have listened to much voting, the ayes are usually vibrant, but the noes attract more attention from those who are trying to think.

Unanimity is often colorless and uninspiring and is often viewed with suspicion of some undefined compulsion. For three thousand years since Icarus and his wings fell into the sea, man has persistently tried to fly and has finally conquered the air. For two thousand years physicians have faithfully kept the hippocratic oath and through its influence have continually polished their shining armor. They have climbed the hills and descended into the shadows and have climbed the hills again, always trying to press onward toward the prize of their high calling, which is the conquest of disease. There are elements in this country which are working for a totalitarian state. There are others who would preserve the essential values of individualism. There are those who would promote a social system in which government would dominate all professional and educational effort. It is not easy to see clearly through so many obscurant influences but we must make serious efforts in this House to think courageously and independently toward whatever is best for American medicine and for the American people.

After you have presented your resolutions you will not have discharged your duty until you have followed them to the reference committee and discussed them there so thoroughly

that you will be able to report to those whom you represent that the resultant action of this House represents the real opinion of this representative body. All reference committee rooms are open, and all delegates are welcome and free to discuss any question that may be assigned to a committee. Reference committees are requested to assemble as promptly as possible and to make every effort to be ready at the earliest possible moment to present their reports. Recesses, while the House waits, wastes time, involves hasty decisions, impairs efficiency and limits the opportunities of the delegates to visit concurrent scientific sessions. Expedition without sacrifice of free discussion should be our desired ideal.

Executive sessions may be of unusual significance. This year because of delicate questions which should be discussed within closed doors—in order perhaps to develop new policies—your Speaker requests that resolutions involving the relationships of physicians to hospitals, or other delicate questions, be either introduced by title and referred to the Reference Committee on Executive Session without reading or be introduced only in Executive Session on Tuesday afternoon.

The Reference Committee on Rules and Order of Business is requested to take this suggestion under early advisement and report as soon as possible.

Since our last session, at Atlantic City, in June 1935, we have lost many former officers of the Association and many former members of the House of Delegates. The dates following their names indicate the years of service:

- Bundy Allen, Tampa, Fla., 1930-1932; 1935 Special Session; 1935.
- James H. Bell, San Antonio, Texas (second vice president, 1904).
- Thomas C. Chalmers, Forest Hills, N. Y., 1919-1930.
- Henry B. Costill, Trenton, N. J., 1919; 1925; 1927
- M. H. Davis, Mays Lick, Ky., 1929.
- C. St. Clair Drake, Chicago, 1920.
- Edward B. Heckel, Pittsburgh, 1906-1907; 1917-1920; 1922; 1924 (Trustee 1924-1932).
- H. M. Johnson, Dawson, Minn., 1926-1927; 1929-1934; 1935 Special Session.
- E. Starr Judd, Rochester, Minn., (second vice president, 1918-1919; member of the Council on Scientific Assembly, 1915-1927; President-Elect 1930-1931; President, 1931-1932).
- John W. Keefe, Providence, R. I., 1914.
- Charles F. Kuhn, Detroit, 1917.
- Frederick Epplen, Seattle, 1923-1924; 1928-1929.
- James W. Gray, Clarksdale, Miss., 1916.
- H. R. Lathrop, Casper, Wyo., 1911; 1919; 1920.
- G. Milton Linthicum, Baltimore, 1935 Special Session.
- J. G. R. Manwaring, Flint, Mich., 1930.
- Charles L. Mix, Chicago, 1906-1907.
- Emmett P. North, St. Louis, 1923-1934; 1935 Special Session; 1935 (member of Council on Medical Education and Hospitals, 1927-1934; member of Judicial Council, 1934-1936).
- Levi H. Pelton, Waupaca, Wis., 1908.
- T. E. Ross Sr., Hattiesburg, Miss., 1928.
- Edwin P. Sloan, Bloomington, Ill., 1924-1932 (member of Judicial Council, 1932-1935).
- Morgan Smith, Little Rock, Ark., 1912-1914.
- H. R. Varney, Detroit, 1907.
- Willis F. Westmoreland, Atlanta, Ga. (fourth vice president, 1896).
- William H. Wilder, Chicago, 1926-1928; 1930-1931.

These, our friends, have passed beyond our vision, but they will continue to live in our memory.

Time, like an ever rolling stream,  
Bears all its sons away;  
They fly forgotten, as a dream  
Dies at the opening day.  
Our God our help in ages past,  
Our hope for years to come  
Be thou our guard while life shall last,  
And our eternal home.

At the request of the Vice Speaker, the members of the House rose and stood for one minute in silent tribute to the memory of departed delegates.

Reference Committees

The Speaker presented the following names of members of Reference Committees:

SECTIONS AND SECTION WORK

- Arthur J. Bedell, Chairman.....New York
- J. F. Bassig.....Kansas
- C. W. Roberts.....Georgia
- Clyde L. Cummer.....Section on Dermatology and Syphilology
- Tom B. Throckmorton.....Section on Nervous and Mental Diseases

RULES AND ORDER OF BUSINESS

- W. H. Seemann, Chairman.....Louisiana
- E. J. Best.....California
- J. H. Fitzgibbon.....Oregon
- I. C. Flippin.....Virginia
- C. W. Waggoner.....Ohio

MEDICAL EDUCATION

- George Blumer, Chairman.....Connecticut
- C. A. Dukes.....California
- Ben R. McClellan.....Ohio
- Joseph F. Siler.....United States Army
- J. Gurney Taylor.....Wisconsin

LEGISLATION AND PUBLIC RELATIONS

- R. L. Sensenich, Chairman.....Indiana
- A. C. Morgan.....Pennsylvania
- E. N. Roberts.....Idaho
- I. H. Irwin.....Montana
- C. J. Whalen.....Illinois

HYGIENE AND PUBLIC HEALTH

- Warren F. Draper, Chairman.....United States Public Health Service
- J. Newton Hunsberger.....Pennsylvania
- F. J. Underwood.....Mississippi
- Guy W. Wells.....Rhode Island
- Henry C. Macatee.....District of Columbia

AMENDMENTS TO CONSTITUTION AND BY-LAWS

- John W. Amesse, Chairman.....Colorado
- John F. Hagerty.....New Jersey
- S. P. Mengel.....Pennsylvania
- Wells Teachnor Sr.....Ohio
- Charles S. Skaggs.....Illinois

REPORTS OF OFFICERS

- Edward H. Cary, Chairman.....Texas
- William R. Brooksher.....Arkansas
- William A. Ellingwood.....Maine
- Edgar A. Hines.....South Carolina
- Edward R. Cunniffe.....New York

REPORTS OF BOARD OF TRUSTEES AND SECRETARY

- Frederic E. Sondern, Chairman.....New York
- W. F. Braasch.....Minnesota
- E. F. Cody.....Massachusetts
- J. H. O'Shea.....Washington
- Walter E. Vest.....West Virginia

CREDENTIALS

- J. D. Brook, Chairman.....Michigan
- B. F. Bailey.....Nebraska
- F. L. Beck.....Wyoming
- J. R. McVay.....Missouri
- Deering G. Smith.....New Hampshire

MISCELLANEOUS BUSINESS

- H. A. Luce, Chairman.....Michigan
- A. J. Scott.....California
- H. B. Everett.....Tennessee
- G. Henry Mundt.....Illinois
- Harvey B. Stone.....Maryland

SPECIAL COMMITTEE ON EXECUTIVE SESSION

The Speaker asked for the consent of the House of Delegates to appoint a Reference Committee on Executive Session, which request was granted, on motion of Dr. Arthur J. Bedell, New York, seconded by Dr. W. H. Seemann, Louisiana, and carried. The Speaker then appointed the following committee:

- C. E. Mongan, Chairman.....Massachusetts
- W. Albert Cook.....Oklahoma
- Wingate M. Johnson.....North Carolina
- Brien T. King.....Washington
- Floyd S. Winslow.....New York

SERGEANTS AT ARMS

- Holman Taylor.....Texas
- Howard C. Frontz.....Pennsylvania

Address of President James S. McLester

The Speaker resumed the Chair and presented the President, Dr. James S. McLester, Birmingham, Ala., who delivered the following address, which was referred to the Reference Committee on Reports of Officers:

*Mr. Speaker and Members of the House of Delegates:*

In addressing this representative body of medical men I feel that it is appropriate to tell you that after completing a year of service as your President I have come to entertain a very high opinion, vastly higher than ever before, of the American physician. I am thinking not only of his scientific attainments and professional usefulness but also of his splendid traits of character and his fine qualities of heart. It has been a great privilege to know him as I have been permitted to know him during the past year. I have been deeply impressed, too, by the solidarity of the medical profession and the loyalty of its members to the American Medical Association. No other

national body has the cohesiveness and the whole hearted support of its constituents such as is enjoyed by this great Association. This is a cause for congratulation and also a challenge. Leadership, such as is unquestionably yours, carries great responsibility.

This Association can look back on a year of successful accomplishment. The scientific assembly at the Atlantic City meeting in which our great neighbor, the Canadian Medical Association, participated, represented the most notable gathering of medical men that has ever taken place on this or any other continent. The scientific exhibit was splendid; the excellence of the contributions, the ease of their arrangement, and their educational value, surpass all previous exhibits. THE JOURNAL throughout the year has been developed still further in usefulness, and the several councils and bureaus, working in the interest of the American people, have extended their influence over constantly wider areas. It has been a notable year.

All of this the House of Delegates can contemplate with satisfaction, for on this House rests in the last analysis the responsibility for the success or failure of this Association and, therefore, a direct responsibility for the welfare of the American physician. Seldom, however, is it possible for a man, while regarding his past accomplishments with satisfaction, to feel that he can rest on these achievements and exert himself no further. So it is with the American Medical Association. Your very success opens up new vistas and points the way to new endeavors. It reveals the possibilities that lie ahead and stimulates you and your officers to still greater effort. It is this work that lies ahead of which I should like to speak.

The thing which above all others interests medical men in America today is the preservation, unimpaired, of established methods of practice, methods by which American medicine has reached its present preeminent position. I am conscious of the fact that every address delivered to you during the past three years has dealt with this subject, often exclusively, and realize that the time has perhaps come to discuss other things. There is, however, something yet to be said and with your indulgence I should like briefly to continue this discussion in order to say a word not only of congratulation but also of stimulation.

There have been times during the past two years when it appeared that disaster was just ahead, when government, in its effort to extend social reform, appeared ready to reach out for control of medical practice, and those who are familiar with the results of such governmental control in other countries contemplated this step with grave misgivings. But the leadership exercised by you over a united medical profession and its influence on public opinion were wise and effective and no such change was accomplished. I think it can be said that the American Medical Association has successfully and usefully challenged the attempts of social scientists, who, without recognition of the medical and scientific considerations involved, would revolutionize the organization of medical care on a social and economic basis. The professional independence of the American physician has been preserved.

Can we afford to rest here? Any one who reads history will say no. In Germany during the last half of the previous century there came first many social reforms, agrarian, industrial, maternal welfare, old age pensions and unemployment insurance, and then finally, in the effort to quiet the continued unrest of the people, and as a panacea for many social ills, Bismarck brought about drastic changes in medical practice. This led to the present deplorable *kranken-kassen* system. A somewhat similar train of events, the result perhaps of different motives, followed in the Scandinavian countries and in France. Then, finally, in England, in the wake of other reforms, came Lloyd George's introduction of the panel system. Always, wherever government has reached out for control of the practice of medicine, it has been at the end of a long series of other so-called social reforms, and such control once established has never been relaxed.

Will history repeat itself in the United States of America? The train of events that I have attempted to describe as having taken place in European countries is already well started in this country, as can be seen in the maternal welfare, old age

pension and other provisions of the social security act recently enacted by Congress. Will the politicians of the near future, anxious to carry governmental subsidies still further, extend their control, as politicians have already done elsewhere, to medical care? Certainly, if I read history aright, the attempt will be made, and repeatedly. Whether it will succeed depends in large measure on the attitude of the medical men of America. There is only one voice that speaks authoritatively for the physicians of America, and that is the American Medical Association. What should be its attitude?

The attitude of the American Medical Association, as in the past, should be one of close attention to the medical needs of the American people and of alert preparedness to meet these needs. We have been sound, eminently sound, in our position that any form of governmental control of the practice of medicine would be fatal to medical progress and that the real sufferers in the end would be the American people. But our soundness on this point should not lead us to deny that there are still many problems, and that the solution of these, so far as the provision of medical care is concerned, will certainly call for intelligent and constructive thought on the part of the men that provide the medical care in the various communities of the country. The fermenting of the public consciousness of evolutionary progress as it relates to medical care will continue. From time to time there will come proposals for action, many of them ill advised, a few of them meritorious. These proposals will come from one (or more) of three sources: (a) from the public, including social scientists, economists and self-appointed reformers; (b) from legislatures, susceptible only too often to demagogic initiative and influence, and (c) from the medical men of the country speaking through their authoritative organization, the American Medical Association. If proposals of merit are to be made, which of these shall be the first to make them? For you and me there can be but one answer. I know that you will agree with me, however, when I remind you that such proposals should never be hastily made. They should be the result of long and deliberate thought and should be adopted only after painstaking investigation.

May I take this occasion, then, respectfully to point out a few instances in which this alertness to the needs of evolutionary progress is either being satisfactorily exhibited or is in need of further stimulation?

1. The appointment two years ago by the Council on Medical Education and Hospitals of a "blue-print committee," whose duty it is to study the medical needs of the future and to suggest for your consideration such revisions of medical education as seem advisable, was a wise, far seeing step. One of the most important among its many problems, I am tempted to say the most important, relates to the admission of medical students. The future of American medicine and the place which the medical profession will occupy in the social structure, whether one of dignified independence or of subordinate subservience, will depend in no small measure, I am convinced, on the type of man who is admitted to the study of medicine. Greater care than ever before is being exercised to devise standards and to select from the enormous number of applicants those men who, broadly considered, are best calculated to measure up to their opportunities. This committee has other difficult problems but it is proceeding with care and deliberation toward their solution. The group includes educators and other physicians of a wide range of professional interest; they are men of judgment and vision and from them can be expected advice that will go a long way toward settling some of the problems with which we are now confronted.

2. The work of the Council on Medical Education and Hospitals and of the Associated Certifying Boards in organizing, under the direction of this House, the several examining boards and in perfecting the machinery for the certification of specialists is a highly meritorious step and one that meets a rather insistent demand on the part of the public. Such certification involves many difficulties and must proceed with deliberation, but it should go forward as rapidly as possible and every effort should be made in the future to insure the effectiveness of this work.

3. To what extent do the hospital insurance schemes now being experimented with in different communities involve imposi-

tion on the attending physician and in other ways do violence to accepted professional standards? Are they adequate for the needs they are supposed to meet? These and similar questions are receiving the attention of the Bureau of Medical Economics. Soon they must be answered authoritatively.

4. Has the time come for a certain amount of standardization throughout the country in the relationship which the medical profession bears to certain governmental agencies, relationships which vary markedly in different communities? And is such standardization advisable? What is the proper relation, for instance, in a given county or community between the established associations of medical men and the public health authorities? In what form can still more effective cooperation between these two groups be worked out? I hope I shall be pardoned for pointing with pride to my own state, where the state medical association is by organic law the state board of health and appoints its own committees and officers. It seems to me that, as soon as we are prepared, steps toward such standardization as is possible could well be taken.

5. Many medical men feel that the care of the indigent must necessarily become in greater degree a charge on local tax funds. Physicians certainly are not weary of helping the unfortunate and of giving their services gratis, but there is a growing feeling that the problem has become too large for that kind of solution. If, then, the care of the indigent is to be recognized as in greater degree a governmental responsibility, what relation is to be worked out between medical men and governmental authorities, in order that purely medical considerations shall remain in the hands of the medical men and not of lay authorities? And who is to certify indigence? The problem has been worked out satisfactorily, I am told, in some communities. How can the principles used there be applied and worked out elsewhere? In this question alone there are a dozen sharp problems.

6. The Bureau of Health and Public Instruction of the Association is doing a meritorious piece of work and is going about it in the right way. Can this work be extended yet further and the public educated to a still better conception of health and the ways of guarding it? What further can be done to correct the public's tendency to depend on drug store prescriptions and "patent medicines" and to call in the doctor only when other sources have failed? What further, if anything, can be done about radio advertising of nostrums and proprietary medicines, which so clearly develop a tendency on the part of the public to deal with grave conditions without benefit of science and without either competent diagnosis or counsel? What can be done in further restriction of quacks and incompetents?

These problems are not comprehensive. Some of them may not be problems at all. But I present them to you as examples of the type of problem with which, in the evolutionary progress of our profession, we must continue to grapple. If they demand solution, we, not demagogues or social reformers, must solve them. Nor are these questions presented for immediate solution. A careful analysis of all factors concerned and profound thinking will be required for the ultimate answer.

And now may I speak of what is uppermost in the minds of all of us, of the great distress that we feel, you and I, over the illness of our friend and President-Elect, Tate Mason. During our brief period of service together as officers in the Association I have come to feel a deep affection for him and to entertain a high regard for his professional ability. Together he and I made a visit last winter to certain Eastern cities, where we discussed the work of the Association and endeavored to interpret your policies. Our object was to tell the members of the profession of the far reaching influence for good of this great Association and to convince them of the wisdom of the policies adopted by you. If there had been the least doubt in my own mind, Tate Mason would have convinced me. Those of you who heard him were, I am sure, proud that he represented you. Tate Mason is built of fine stuff. His qualities of heart and mind endear him to all men who know him. His illness is a great sorrow to all of us and I know that you join me in wishing him an early recovery.

### Message from President-Elect

Dr. Brien T. King, Washington, read the following message from Dr. J. Tate Mason, President-Elect of the American Medical Association, who was prevented from being in attendance because of illness, which was referred to the Reference Committee on Reports of Officers:

*Mr. Chairman and Delegates of the American Medical Association:*

Within the past year I have had the pleasure of speaking before approximately 8,000 physicians, not including the American Pharmaceutical Association and the physicians of British Columbia. These addresses were given in eighteen different states, and, while some of them were on scientific subjects, I found that the vast majority of the men of the profession were interested in the economic situation and that this subject was always brought in and discussed before the meetings adjourned.

I was surprised to find how little the average American physician knows about the work that is being carried on at the headquarters of the American Medical Association. To enable these physicians to understand and appreciate the many activities of the national association, with which you of the House of Delegates are so well acquainted, I suggested to the secretaries of the state societies and the editors of the state journals, at their meeting in Chicago last November, that each state should send at its own expense a representative to Chicago for a week each year, to study and acquaint himself with the activities of the Association so that he might bring an idea of these home to the men of his state. I suggested that this physician should not be a secretary or other officer of the state association or the editor of the journal, but some man who could impart this knowledge to the men of his state, and that this should be his sole duty.

In this rather brief address to the House of Delegates, I should like to impart to you the impression that I received from hundreds of these physicians to whom I was able to talk in practically all parts of America. It goes without saying that they did not all think alike. There were many fantastic and weird suggestions, but on the whole the physicians can be divided into three groups with respect to their ideas on medical economics. The first two groups together form a distinct minority, and the last and largest group stands out far in the majority throughout the country except in a few places on the Pacific and the Atlantic coasts.

Group A included a number of men who felt that the American Medical Association needed more leadership, that the House of Delegates should have met again last February, and that very definite proposals should be made for the future of organized medicine. They felt that a great deal of money should be spent for publicity, radio, newspapers, and so on. Some of these men felt that the House of Delegates should never meet at the Scientific Session because so many weighty problems had to be dealt with in such a short space of time that very rarely were they able to carry through to completion many things that were of utmost importance to medical practice today. This, however, represented a small group of men. This rather small group of individuals in many instances felt that the American Medical Association should prepare some skeleton plan of medical service with which all the county societies could immediately join in. A working basis could be developed from this plan which would eventually become universal for all the component societies of the American Medical Association.

In group B there were men who believed that a change in the delivery of medical care is impending and probably necessary. They would advise in this evolutionary development that all that is good and worth while in the present schemes in practice be preserved intact. They felt that it was necessary in this changed condition of practice to preserve all the fine traditions and high quality of medical care and the fine features of individualistic medical practice. These men approved of the small units of service over limited geographic areas that are being organized at the present time rather than of a large aggregation of units. They felt it would take at least five to ten years to study these schemes, and by that time many could

be correlated and regulated to prevent competition between them and also to avoid overlapping in their spheres of activity. They doubted whether any scheme for medical service would be applicable to all sections of the country. The difference in the character of the localities and of the people residing in them would necessitate differences of course in the schematic outline.

Group C, which carried definitely the largest number of physicians in America that I was able to see and whose views I was able to hear, felt that the Board of Trustees and the House of Delegates do recognize the medical situation which exists today. This situation is found not only in one part of America but practically throughout the United States. The men of this group felt that it was inevitable that the medical profession should suffer severely from the economic crisis of the past few years. Like other professional as well as business groups, we depend on the purchasing power and the prosperity of the general masses of our population. They felt it was equally inevitable in such a time of stress that considerable attention should be focused on the financial aspects of the practice of medicine. The stringency, in its acutest phase, made medical economics a matter of primary concern. Such a state of affairs, they felt, was not conducive to that balanced thinking which accompanies a sense of security and well being. Judgment is likely to become hasty and action is not always for the best. It is not surprising that in such a time of trial numerous schemes should be devised to change the existing order. Some of these plans have originated within and some outside of the medical profession. Some have received great support, with the hope that their application might result in an improved economic condition. With regard to the physician, many of these plans involve changes which social welfare workers, foundations and many industrialists have been working assiduously for many years to impose on us.

This movement inside the medical profession is paralleled by the appearance of *unsound schemes offered as cures for the economic ills of our general population*. The valley of every business cycle, when our fortunes are at low ebb, has ever been a fertile breeding ground for panaceas of all kinds. As the cycle begins the upward swing toward prosperity, the panaceas are abandoned and forgotten.

In such times the American Medical Association through its democratic system of representative bodies, the House of Delegates and the Board of Trustees, seeks to formulate policies and principles to guide its component societies and membership through the stormy waters of economic experimentation. The men of this group C of whom I am speaking were glad to know that many of the policies set forth by the Association are simply the restatement of fundamentals which our leaders for nearly a century have found to be essential to the preservation of the most advanced medical practice, as well as the best professional care to the public. They were pleased and gratified to hear that the aim of the American Medical Association is to preserve the individual private practice of medicine, with free and open competition among physicians and the maintenance of personal relationship of doctor and patient. The well considered opinion of leaders in medicine throughout the country is that once this principle is compromised the medical profession of this country is headed toward the status of serfdom.

They realized that there are some who hold that, unless the medical profession develops a new plan for the care of the masses, state medicine is inevitable and that the way to forestall this traditional bugbear is to set up organizations under medical control to perform the functions of a state system of medicine. However, these men felt that no more proved fallacy exists than this. The history of other countries clearly shows that voluntary prepayment and insurance schemes, in the hands of the profession at the outset, drift inevitably, as do all plans initiated by private groups, into bureaucratically administered compulsory insurance under governmental control. They felt that the most certain method of hastening state medicine is for the medical profession to institute radical changes in medical practice in the form of some experiment of this kind.

The medical profession may rest assured that its future depends on the defeat of the present trend toward general

socialization and the maintenance in America of at least a moderate individualism. The socialization of medicine is only one phase of the movement toward general socialization and the ultimate abandonment of the American individualistic system. We must accept the adversity as well as the prosperity which accompanies our continually changing times, knowing full well that the lean years of the economic cycle are compensated for by long periods of prosperity. The alternative is the bartering of our status as independent professional men for the dependent and fixed condition of government servitude.

In conclusion, a majority of the men whom I have met in this country felt that they had no great disapproval of the adoption of sickness insurance carried out by the local medical societies if it had the approval of the majority of the members. However, on the other hand, they were almost unanimous in their disapproval of the adoption of sickness insurance, either of the voluntary or of the compulsory variety, as a whole. They likewise disapproved of the extension of federal control of medicine.

#### Interpretation of Constitution and By-Laws

Dr. Frederic E. Sondern, New York, moved that, under the extraordinary circumstances involving the incapacity of the President-Elect, it would seem desirable to have an interpretation of the Constitution and By-Laws by the Judicial Council and to have that Council report to the House on the matter as soon as possible. The motion was seconded by Dr. Samuel J. Kopetzky, New York.

Dr. Holman Taylor, Texas, suggested that the motion be amended to request the Judicial Council also to analyze this situation and to recommend a procedure. The amendment was accepted and the motion as amended carried.

#### Address of Vice President Kenneth M. Lynch

The Speaker presented the Vice President, Dr. Kenneth M. Lynch, Charleston, S. C., who delivered the following address, which was referred to the Reference Committee on Reports of Officers:

#### *Mr. Speaker, Mr. President and Representatives of the Greatest Medical Organization in Existence:*

I am not given to the use of superlative terms. I address you in this fashion deliberately not as a matter of compliment to you in return for your compliment to me, but in recognition of your accomplishment.

The present occasion has led me in recent days to look into some of the old proceedings of this body in its early days, and particularly into the minutes of the fourth annual convention, which was held in my own city in 1851.

There are many interesting, enlightening and helpful expressions and actions in the study of these old recordings, and I would recommend that it would be good for all of us in our present-day problems to give some study to them. I shall not presume on your time at the present to make tempting and perhaps profitable comparisons of the problems of this former day, now four score and five years ago. Those of the present are not so different. The difference is largely in degree and not particularly in kind. But I would in justification of my greeting to you recall what was interesting to observe in the minutes of the fourth annual session of the American Medical Association, that there was scepticism among the members of the Association and doubt from the European profession that the American Medical Association would prove worthy of its objectives.

In the intervening years this body has demonstrated its ability to carry forward those objectives toward accomplishment, and so my greeting to you. The American Medical Association, through its work particularly, has reached the peaks of success.

Permit me to remind you, however, that in journeying from the lowlands to the highlands the going is most arduous at the extremes. In the beginning the bogs and sloughs and roughness may defeat weak purpose and inefficient organization; after a full swing has got under way, progress may be com-

paratively easy, but when the heights are reached courage, stamina and unflinching resolution are essential if the route is to be completed.

There are obstacles of obstruction to overcome and pitfalls to avoid, but we have every confidence that our progress will not be altered in attempting to reach the ever present goal of improving service to life. As a process in your work let me commend the following principle quoted from the minutes of the American Medical Association in 1851:

"The only way to remove the errors is that old and homely way so effective in removing error on other subjects—the presentation of the truth. But the effort must be made in the right spirit. Ill natured attacks do no good. Railing never convinced any man of his error. Confidence in the power of truth, and charity toward the common propensity of the human mind to err should teach physicians patience in their attempts to convince their fellow men of their errors on so abstruse a subject as medicine. The lesson of patience will be better learned if we remember that most of the popular medical errors had a common origin with some that have prevailed among medical men, and that not a few took their rise first in the profession and afterward spread among the people. Too much importance, we think, has been generally attached to those means which are direct and too little to those which are indirect in their application."

## REPORTS OF OFFICERS

### Report of the Secretary

Dr. Olin West presented his report as Secretary, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary.

### Affiliate and Associate Fellowship Applications

On motion of Dr. H. B. Everett, Tennessee, seconded by Dr. John Z. Brown, Utah, and carried, the Affiliate and Associate Fellowship Applications in the hands of the Secretary were referred without discussion to the councils and sections indicated.

### Greetings from National Congress of Parents and Teachers

The Secretary presented the following telegram:

National Congress of Parents and Teachers extends cordial greetings to the American Medical Association in convention assembled with deep appreciation for its long continued cooperation.

MRS. B. F. LANGWORTHY.

### Report of the Board of Trustees

Dr. Rock Sleyster, Chairman, presented the report of the Board of Trustees, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary, except those portions of the report referring to the Bureau of Legal Medicine and Legislation and to the Bureau of Medical Economics, which were referred to the Reference Committee on Legislation and Public Relations.

### Supplementary Report of Board of Trustees

Dr. Rock Sleyster, Chairman, also presented the following supplementary report of the Board of Trustees, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary, except the portion referring to the memorandums, which was referred to the Reference Committee on Executive Session:

#### RADIO ADVERTISING

In reference to the resolution relative to obviating the evil of radio broadcasting of medical misinformation, introduced to the House of Delegates last year by Dr. James F. Rooney, New York, and that condemning the broadcasting of misinformation pertaining to medicaments, food and cancer introduced by Dr. Holman Taylor, Texas, both of which were referred to the Board of Trustees, the Board would report that representations have been made by the Association to the broadcasting chains and to the Federal Communications Commission, which is concerned with radio broadcasting. There is a general recognition of the danger of such advertising, and the leading broad-

casting chains have announced censorship of medical advertising to go into effect at once with the elimination of advertising of cathartics, laxatives and other medicinal preparations, just as soon as current contracts expire.

The subject of radio advertising is, of course, also involved in the proposed new foods and drugs legislation. In many local communities, steps are being taken to bring pressure to bear on the management and ownership of these stations, with a view to eliminating false medical advertising. This is a reform in which progress must of necessity be slow. We are, however, continuing our efforts through popular education, using *HYGEIA* and the Bureau of Health and Public Instruction, as well as the informational service supplied by the Bureau of Investigation in the headquarters.

#### HYGEIA IN CCC CAMPS

The Board is glad to report that, pursuant to the resolution introduced in the House of Delegates last year by Dr. Ralph Fenton, Oregon, correspondence has been conducted with the Army Medical Department and that as a result some 3,000 subscriptions for *HYGEIA* have been promised. It is expected that these subscriptions for the CCC camps will begin with the July issue.

#### MEMORANDUMS FROM BUREAU OF LEGAL MEDICINE AND LEGISLATION

The Board presents two memorandums from the Bureau of Legal Medicine and Legislation, one dealing with the proposed omission of items referring to legitimacy and illegitimacy from standard forms for reports of births and stillbirths, and the other dealing with suggested limitation of right of certain physician-offenders against the Harrison Narcotic Act to obtain narcotic drugs for professional use and to prescribe such drugs professionally.

#### INVITATION TO ASSOCIATION TO MEET WITH CANADIAN MEDICAL ASSOCIATION IN 1939

An invitation from the Canadian Medical Association for a joint meeting in Toronto in 1939 received consideration of the Board and was referred to the House of Delegates with a statement to the effect that it does not seem expedient to make plans for a joint meeting with the Canadian Medical Association in the near future.

#### Report of the Judicial Council

Dr. George Edward Follansbee, Chairman, presented the report of the Judicial Council, which was referred to the Reference Committee on Reports of Officers.

#### Report of the Council on Medical Education and Hospitals

General Merritte W. Ireland, Washington, D. C., presented the report of the Council on Medical Education and Hospitals, together with the two following supplementary reports, which was referred to the Reference Committee on Medical Education:

#### Supplement A. Schools for Physical Therapy Technicians

The preliminary study of schools for physical therapy technicians by the Council on Medical Education and Hospitals, authorized by the House of Delegates during the annual convention of the American Medical Association at Cleveland, June 11-15, 1934, has been completed.

Thirty-seven schools were included in the survey. After carefully studying the inspection reports and securing the opinions of the Council on Physical Therapy, the American Congress on Physical Therapy and the American Physiotherapy Association, the following essentials are proposed:

#### ESSENTIALS OF AN ACCEPTABLE SCHOOL FOR PHYSICAL THERAPY TECHNICIANS

##### I. ORGANIZATION

1. A school for physical therapy technicians should be incorporated as or under a nonprofit institution. Its board of trustees should be composed of public spirited men or women having no

financial interest in the operations of the school. The trustees should serve for fairly long and overlapping terms. If the choice of trustees is vested in any other body than the board itself, that fact should be clearly stated. Officers and faculty of the school should be appointed by the board.

2. Affiliation with a college, university or medical school is highly desirable but is not an absolute requirement.

## II. FACULTY

3. The school should have a competent teaching staff, graded and organized by departments. Appointments should be based on thorough education and training and successful teaching experience. Nominations for faculty positions should be made in accordance with academic custom. The staff should include not less than one qualified salaried instructor and in each institution where practical training is carried on not less than one qualified physical therapist. The question of full time and part time appointments is not as important as the qualifications of the instructors, who should be specialists or exceptionally well trained and well qualified in the lines they are teaching.

## III. PLANT

4. The school should own, or enjoy the use of, buildings sufficient in size to provide adequate lecture rooms, class laboratories and administration offices. Adequate equipment should include anatomic charts, manikins, models, stereopticons and other aids to effective teaching. It is suggested that dissecting materials should be provided to enable each student to dissect or have the benefit of demonstration of dissection of at least the lateral half of the human cadaver. Skeletons and disarticulated bones should be supplied. There should be a library receiving regularly all the scientific periodicals pertaining to physical therapy, current numbers of which should be easily accessible to the students.

## IV. CLINICAL FACILITIES

5. Provision should be made for each student to receive practice training adequate in kind and amount under competent supervision in physical therapy in a hospital or other institution acceptable to the Council on Medical Education and Hospitals of the American Medical Association.

## V. RESOURCES

6. Experience has shown that a modern school of physical therapy cannot as a rule be maintained by the income from students' fees. No physical therapy school, therefore, should expect to secure approval which does not have a substantial income in addition to students' fees.

## VI. ADMINISTRATION

7. There should be careful and intelligent supervision of the entire school by an executive officer who, by training and experience, is fitted to interpret the prevailing standards in physical therapy education, and who is clothed with sufficient authority to carry them into effect.

8. There should be satisfactory records, showing conveniently and in detail the credentials, attendance, grades and accounts of the students, by means of which an exact knowledge can be obtained regarding each student's work. Except for good cause, such as for illness, no credit should be given for any course when the attendance has been less than 90 per cent of the full time.

## VII. REQUIREMENTS FOR ADMISSION

9. Candidates for admission should be able to satisfy one of the following requirements:

- Two years or sixty semester hours of college, including courses in physics and biology.
- Graduation from an accredited school of nursing.
- Graduation from an accredited school of physical education.

Courses in general physics, chemistry and biology are highly recommended for all who seek to enter training in physical therapy.

10. The admission of students to the physical therapy school must be in the hands of a responsible committee or examiner,

whose records shall always be open for inspection. Documentary evidence of the student's preliminary education should be obtained and kept on file. When the physical therapy school is an integral part of the university, this work usually devolves on the university examiner.

11. Advanced standing may be granted to students for work done in other acceptable physical therapy schools or hospital departments, provided the entrance requirements and other essentials herein set forth have been complied with. Official verification of the student's previous physical therapy work should be obtained by direct correspondence with the schools previously attended, and his preliminary qualifications should also be verified and recorded the same as for first-year students.

12. Complete physical examination of each student admitted should be conducted under the auspices of the school.

## VIII. PUBLICATIONS

13. The school should issue, at least annually, a bulletin setting forth the character of the work which it offers. Such announcement should contain a list of the members of the faculty with their respective qualifications.

## IX. MINIMUM CURRICULUM

Subjects	Hours	
	Theory	Laboratory and Practice Training
Anatomy (including applied anatomy, demonstration on cadaver and lecture).....	210	...
Clinical practice .....	...	400
Electrotherapy .....	30	45
Ethics and administration.....	5	..
Hydrotherapy .....	5	15
Massage .....	15	45
Pathology .....	30	..
Physiology .....	30	45
Principles of physical therapy as applied to:		
Medicine .....	15	30
Neurology .....	10	15
Orthopedics .....	15	30
Surgery (including surgical observation)..	15	30
Psychology .....	15	..
Therapeutic exercise.....	30	75
Electives .....	45	..
Total .....	470	730
		1,200 hours

Suggested electives: asepsis, bandaging, first aid, history of physical therapy, hygiene, joint measurements, office routine, occupational therapy, records, social service.

All subjects should be taught by qualified teachers.

Length of course: Not less than nine months.

## Supplement B. Schools for Clinical Laboratory Technicians

During the past two years the Council on Medical Education and Hospitals has made a study of schools for the training of clinical laboratory technicians. One hundred and ninety-six schools have been examined and their procedures analyzed. After consultation with the American Society of Clinical Pathologists, the following standards are proposed as a basis for the recognition of schools for laboratory technicians:

## ESSENTIALS OF AN ACCEPTABLE SCHOOL FOR CLINICAL LABORATORY TECHNICIANS

### I. ORGANIZATION

1. Acceptable schools for training laboratory technicians may be conducted by general hospitals, colleges or universities. Consideration may be given courses operated by public health laboratories or by pathologists.

2. Responsibility for courses in hospitals should be placed on the hospital administration rather than the laboratory director. In colleges and universities this responsibility is on the controlling board, as for other courses.

3. Resources for continued operation of the school should be insured through regular budgets, gifts or endowments; but not entirely through students' tuition fees. Experience has shown that commercial schools operated for profit frequently do not

adhere to proper ethical and educational standards and are, as a rule, not considered acceptable.

4. There must be available transcripts of high school, college work and other credentials. Attendance and grades of students shall be carefully recorded, by means of which an exact knowledge may be obtained regarding each student's work.

## II. FACULTY

5. The school should have a competent teaching staff. The director must be a graduate in medicine and a pathologist or clinical pathologist of recognized ability. He shall take part in and be responsible for the actual conduct of the training course. He shall be in daily attendance for sufficient time to supervise properly the laboratory work and teaching.

6. In laboratory practice the enrolment shall not exceed one student to each member of the teaching staff. The staff should include not less than one salaried instructor who is a registered technician or eligible for registration, in addition to the laboratory director.

## III. CLINICAL FACILITIES

7. Each student should receive practice training, adequate in kind and amount, under competent supervision, in a hospital laboratory. The hospital should be registered by and be otherwise acceptable to the Council on Medical Education and Hospitals of the American Medical Association and have a minimum of 2,000 yearly admissions.

8. Adequate space, light and modern equipment shall be provided in the laboratory department. A library containing up-to-date references, texts and scientific periodicals pertaining to clinical laboratory work and pathology should be maintained.

9. Satisfactory record systems shall be provided for all work carried on in the department. Monthly and annual classifications of the work of the department should be prepared.

## IV. CURRICULUM

10. A. Candidates for admission should be able to satisfy one of the following requirements:

1. One year of college work, including chemistry and biology from a recognized college or university. Jan. 1, 1938, this requirement is to be raised to two years of college work.
2. Graduation from a school of nursing recognized by the state board of nurse-examiners, and in addition college chemistry.

B. The course of training shall be not less than twelve months in duration and shall include the following divisions:

1. Biochemistry.
2. Hematology.
3. Bacteriology.
4. Parasitology.
5. Histologic technic.
6. Serology.

The instruction shall include:

1. Text assignments.
2. Lectures.
3. Demonstrations.
4. Quizzes.
5. Examinations—written, oral and practical.

## V. ETHICS

11. Exorbitant fees and commercial advertising shall be considered unethical.

12. Schools conducted for the purpose of substituting students for paid technicians will not be considered for approval.

### Report of the Council on Scientific Assembly

Dr. James E. Paullin, Atlanta, Ga., in the absence of the Chairman of the Council, Dr. Irvin Abell, Kentucky, presented the report of the Council on Scientific Assembly, which was referred to the Reference Committee on Sections and Section Work.

### Supplementary Report of Council on Scientific Assembly

Dr. Olin West, Secretary, presented the following report dealing with blood grouping in establishing the paternity of a child, which was referred to the Reference Committee on Sections and Section Work:

The Committee of the Council on Scientific Assembly has looked into the question of blood grouping in establishing the paternity of a child, and it wishes to report at the present time that, from its knowledge of this subject and a careful study of the literature, it is not possible to state with any degree of certainty that the child is an offspring of a certain adult or that the latter is the father or mother of the child.

The committee recommends that the subject should have more thorough study and would suggest that this study be made by a group of investigators having a first-hand knowledge of this matter. It is suggested that Drs. Landsteiner, Wiener and Levine be asked by the Board of Trustees to look into this matter further.

### Report of Committee to Study Contraceptive Practices and Related Problems

Dr. James R. Bloss, Board of Trustees, announced that there would be ready for presentation at the Executive Session a report of the Committee to Study Contraceptive Practices and Related Problems, and the Speaker announced that this was referred to the Reference Committee on Executive Session.

### Report of Reference Committee on Rules and Order of Business

Dr. W. H. Seemann, Chairman, presented the following report:

Your Reference Committee on Rules and Order of Business has carefully considered that portion of the Speaker's Address which refers to executive sessions, and offers the following resolutions:

*Resolved*, That the Speaker of the House of Delegates, now in session, be empowered, at his discretion, to refer any resolution to the Special Reference Committee on Executive Session; and be it further

*Resolved*, That the Speaker be empowered to declare an executive session whenever he deems one necessary.

Your Committee suggests that members having resolutions to present at this session kindly confer with the Speaker beforehand in order that proper disposition of the resolutions may be made.

Respectfully submitted.

W. H. SEEMANN, Chairman.  
E. J. BEST.  
J. H. FITZGIBBON.  
J. C. FLIPPIN.  
C. W. WAGGONER.

On motion of Dr. Seemann, seconded by Dr. H. B. Everett, Tennessee, and carried, the report was adopted.

## NEW BUSINESS

### Consideration of a Bill (S. 4516) to Provide for Tuberculosis Hospitals and for Their Operation

Dr. Horace Reed, Oklahoma, requested that the proper reference committee of the House consider the desirability of a bill (S. 4516) to provide for tuberculosis hospitals and for their operation. The Speaker referred this to the Reference Committee on Legislation and Public Relations.

### Resolution on Status and Responsibility for Answers Published in Queries and Minor Notes in The Journal

Dr. Albert Soiland, Section on Radiology, introduced the following resolution, which was referred to the Reference Committee on Sections and Section Work:

The following resolution was introduced by Dr. Thomas A. Groover, Washington, D. C., before the Executive Session of the Section on Radiology of the American Medical Association

at the Atlantic City session in 1935, and was adopted by unanimous vote:

WHEREAS, The answers published in the Department of Queries and Minor Notes of THE JOURNAL of THE AMERICAN MEDICAL ASSOCIATION, being unsigned, are readily construed as representing the official opinion of the American Medical Association, thus giving them a standing and authority which would otherwise not obtain, and

WHEREAS, The answers are obviously on occasion merely the expression of individual opinion and should be interpreted in the light of that fact, and

WHEREAS, Without such interpretation the answers are misleading and deceptive and capable of working a serious injustice to many who may hold opinions at variance with those expressed; therefore be it

*Resolved*, That the Section on Radiology of the American Medical Association recommends to the House of Delegates that appropriate steps be taken to make plain to the casual readers of THE JOURNAL the status of and responsibility for the answers published in the Department of Queries and Minor Notes

### Resolutions on Taking Steps That Will Result in Practice of Medicine Being Conducted by Physicians and Not by Hospitals

Dr. Albert Soiland, Section on Radiology, presented the following resolutions, which were referred to the Reference Committee on Medical Education:

WHEREAS, Certain lay groups in this country are arranging for or attempting to arrange for the provision of diagnostic medical services along with and as a part of hospital services, and

WHEREAS, The provision of such diagnostic medical services must inevitably foster fundamental changes in the practice of medicine, and

WHEREAS, The American Medical Association is of the opinion that the practice of medicine should at all times be confined to fully licensed physicians, and

WHEREAS, Article 6, Section 4, of the Principles of Medical Ethics sets forth the following

"It is unprofessional for a physician to dispose of his professional attainments or services to any lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit a direct profit from the fees, salary or compensation received to accrue to the lay body or individual employing him. Such a procedure is beneath the dignity of professional practice, is unfair competition with the profession at large, is harmful alike to the profession of medicine and the welfare of the people, and is against sound public policy."

Now therefore be it

*Resolved*, That the House of Delegates of the American Medical Association is unalterably opposed to such practices, and be it further

*Resolved*, That the House of Delegates of the American Medical Association is opposed to the division of any branch of medical practice into so called technical and professional portions, and be it further

*Resolved*, That the Council on Medical Education and Hospitals of this Association be and is hereby authorized and directed to take such steps as will result in the practice of medicine being conducted by physicians and not by hospitals, and be it further

*Resolved*, That the said Council be and hereby is directed annually to report to this House of Delegates such progress as it is able to achieve from time to time

### Resolutions Disapproving Division of Any Branch of Medicine Into Technical and Professional Portions

Dr. Edward M. Palette, California, presented the following resolutions, printed in the Handbook, which were referred to the Reference Committee on Executive Session:

Under instructions of the Council of the California Medical Association, the California Medical Association delegates to the 1936 Kansas City session are directed to introduce the following resolutions in the American Medical Association House of Delegates:

WHEREAS, Certain organized lay groups in this country are endeavoring to arrange for the provision of diagnostic medical service along with and as part of hospital services, and

WHEREAS, The provision of such diagnostic medical service will inevitably foster fundamental changes in the practice of medicine, and

WHEREAS, Such changes in the practice of medicine may well result in deterioration of our present medical standards and especially in deterioration in the quality of medical care furnished to hospital patients, now therefore be it

*Resolved*, That it is the official policy of the House of Delegates of the American Medical Association that it disapproves of the division of any branch of medicine into technical and professional portions, and be it further

*Resolved*, That copies of this resolution shall be brought to the attention of the American Hospital Association and its affiliated groups, to the end that existing arrangements permitting division in medical practice be terminated as speedily as possible

### Resolution on Favoring One Basic Law Governing Industrial Health Propositions

Dr. A. R. McComas, Missouri, presented the following resolution, which was referred to the Reference Committee on Hygiene and Public Health:

Under instruction of the house of delegates of the Missouri State Medical Association at the seventy-ninth annual meeting held in Columbia, April 13-15, 1936, Missouri delegates to the 1936 Kansas City session desire to introduce the following resolution:

WHEREAS, The incidence of industrial diseases is growing more and more serious each day with special reference to chest condition produced by the inhalation of dust, and

WHEREAS, There is no uniform law governing the operations of various industries in our many states; and

WHEREAS, Neither labor nor industry knows where it stands, therefore, both are at a disadvantage, and

WHEREAS, There is no adequate uniform regulation to protect either the laborer or the industry; and

WHEREAS, Under the existing circumstances it is impossible for the small industry to carry insurance to protect its existence on account of high premiums, and

WHEREAS, Due to the lack of uniformity of laws large insurance companies are reluctant to take the risk of carrying any company who may have the least semblance of dust during its operation because there is no adequate law to force the employee to obey the rules of the company, and

WHEREAS, Most of the larger companies are engaged in interstate transactions and, therefore, difficult for each state to enforce the laws that already exist, and

WHEREAS, Certain companies are daily moving from one state to another in order that they may have protection, or that they may dodge some adverse legislation that may be passed while they are operating in said state; and

WHEREAS, Due to the lack of uniformity of law concerning these health problems, many cities and states are losing incomes that they are justly entitled to by virtue of the fact that the company under consideration is located in said state or city where prohibitive legislation is bad, therefore be it

*Resolved*, That it is the official policy of the House of Delegates of the American Medical Association to favor either federal legislation on these points or some uniform compact between states so that there will be one basic law governing all these health propositions

### Resolutions on Disapproval of Division of Radiology Detrimental to Best Interests of the Public, the Medical Profession and the Hospitals

Dr. Francis F. Borzell, Pennsylvania, introduced by title resolutions dealing with disapproval of division of radiology, which were referred to the Reference Committee on Executive Session.

### Resolution Requesting Establishment of Committee to Study Scientific Status and Development of Progress in Air Conditioning

Dr. Arthur J. Bedell, New York, introduced the following resolution, which was referred to the Board of Trustees

WHEREAS, The relationship existing between temperature, humidity and other factors in the atmosphere are matters of great concern to general health, and

WHEREAS, Mechanical and other services are being developed for modifying and controlling the air we breathe and the conditions of respiration, therefore be it

*Resolved*, That the Board of Trustees establish a committee and provide sufficient funds for ascertaining the scientific status of methods and the development of progress in air conditioning

### Resolution Requesting the Appointment of Committee on Asphyxia

Dr. Frederic E. Sondern, New York, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The aims and purposes of the Society for the Prevention of Asphyxial Death were approved by the Medical Society of the State of New York, May 14, 1934, and

WHEREAS, These aims and purposes were later approved by the House of Delegates of the American Medical Association, June 12, 1934, and

WHEREAS, The Society for the Prevention of Asphyxial Death was invited by the Bureau of Exhibits of the American Medical Association to prepare an exhibit for the Scientific Exhibit at the regular session of the American Medical Association, which was held at Atlantic City in June 1935; and

WHEREAS, The Scientific Exhibit of the American Medical Association subsidized space for eight booths on the Prevention of Asphyxial Death at this exhibit; and

WHEREAS, A favorable impression was created by this exhibit, and the need for an organized movement to prevent asphyxial death was emphasized; and

WHEREAS, It has been satisfactorily established that asphyxiation constitutes a major medical problem, representing a mortality of at least 50,000 deaths a year; and

WHEREAS, A National Committee on Hospitals has been established by the Society for the Prevention of Asphyxial Death, consisting of 300 hospital superintendents from forty-five states, as well as a National Committee on Anesthesia, representing more than 50 per cent of the physicians registered as anesthetists in the 1934 Directory of the American Medical Association; therefore be it

*Resolved*, That the House of Delegates of the American Medical Association, at the Kansas City session to be held in May 1936, be petitioned to create a Committee on Asphyxia for the further study of this problem.

#### Resolution on Entrance Requirements to Medical Courses of Educational Institutions

Dr. H. A. Luce, Michigan, presented the following resolution, which was referred to the Reference Committee on Medical Education:

WHEREAS, The relationship between physician and patient embodies many factors which must be considered in the determination of an individual's fitness to become a doctor of medicine; and

WHEREAS, The entrance requirements to the degree of Doctor of Medicine cannot be evaluated on a strictly academic basis; therefore be it

*Resolved*, That the House of Delegates of the American Medical Association transmit to the Council on Medical Education and Hospitals the recommendation that entrance requirements to the medical courses of the educational institutions of the United States be conditioned on the character, personality, adaptability, social fitness and motivations of the applicant as well as on his academic training.

#### Resolutions Condemning as Unethical the Listing of Physicians by Specialty in Directories Published by Commercial Concerns

Dr. William R. Brooksher, Arkansas, introduced the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, Certain commercial interests are publishing medical directories, listing physicians by specialty and otherwise, as available for insurance and compensation work, and other professional services; and

WHEREAS, Participation by listing in these lay publications merely serves for the profit of the promoters and is furthermore technically indirect solicitation of patients; therefore be it

*Resolved*, That the Arkansas Medical Society condemns these practices as unethical and forbids its members to continue listing their names in such directories; and be it further

*Resolved*, That the Arkansas Medical Society requests the House of Delegates of the American Medical Association to take similar action.

#### Resolution on Granting Approval to Hospitals for General Internships or Residencies

Dr. John H. Fitzgibbon, Oregon, presented by title a resolution dealing with the granting of approval to hospitals for general internships or residencies, which was referred to the Reference Committee on Executive Session.

#### Resolution on Opposition to Granting a Single Short Wave Frequency to Commercial Concerns for Emergency Communications to Physicians

Dr. John H. Fitzgibbon, Oregon, introduced the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, the owner of a commercial telephone exchange now selling an emergency telephone service in an Eastern city has petitioned the Federal Communications Commission for the allocation to him of a single short wave frequency to be used in a projected radio-paging service to be sold to the medical profession in the larger cities; and

WHEREAS, The granting of such a petition by the Federal Communications Commission would confer on a commercial concern, organized for profit, a nation-wide monopoly of emergency radio communication with the entire medical profession, to the possible future detriment of the public and the medical profession; therefore be it

*Resolved*, That the House of Delegates of the American Medical Association go on record as opposing the granting by the Federal Communications Commission of a single short wave frequency to any commercial concern for the purpose of emergency communication with physicians and as favoring the allocation of frequencies for this purpose to individual local stations, and this only following the recommendation of the local medical society in the city concerned.

#### Resolutions on Contraception

Dr. Olin West, Secretary, announced that he had received a resolution dealing with contraception from the secretary of the Montgomery County, Pennsylvania, Medical Society and from the secretary of the Chicago Gynecological Society, but that this matter had already been dealt with by the appointment of a committee. The resolutions were referred to the Reference Committee on Executive Session.

#### Communication on Cooperation with United States Constitution Sesquicentennial Commission

Dr. Olin West, Secretary, presented a communication and suggested form of resolution, received from the Director General of the United States Constitution Sesquicentennial Commission, to be adopted by national and state organizations to cooperate with the commission in preparing and executing plans for a fitting celebration of the one hundred and fiftieth anniversary of the formation of the constitution of the United States. These were referred to the Reference Committee on Hygiene and Public Health.

The meeting recessed at 1:15 p. m., to reconvene on Tuesday morning, May 12, at 9:30.

(To be continued)

### REGISTRATION AT KANSAS CITY

The total registration at the Kansas City session was 6,824. Below are given two summaries—one by sections and one by states:

#### Registration by Sections

Practice of Medicine.....	2,250
Surgery, General and Abdominal.....	1,141
Obstetrics, Gynecology and Abdominal Surgery.....	420
Ophthalmology.....	338
Laryngology, Otology and Rhinology.....	256
Pediatrics.....	400
Pharmacology and Therapeutics.....	39
Pathology and Physiology.....	171
Nervous and Mental Diseases.....	193
Dermatology and Syphilology.....	194
Preventive and Industrial Medicine and Public Health.....	123
Urology.....	189
Orthopedic Surgery.....	180
Gastro-Enterology and Proctology.....	181
Radiology.....	266
Miscellaneous Topics.....	12
Tuberculosis.....	91
Two or more sections or no section marked.....	380
Total.....	6,824

#### Registration by States

Alabama.....	35	Nevada.....	2
Arizona.....	22	New Hampshire.....	4
Arkansas.....	106	New Jersey.....	38
California.....	199	New Mexico.....	27
Colorado.....	205	New York.....	243

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION, PUBLIC HEALTH, ETC.)

### ARKANSAS

**Personal.**—Dr. Wells F. Smith, Little Rock, has been elected president of the state board of health.—Dr. John C. Pate has been elected mayor of Leslie.

**State Medical Election.**—Dr. Oscar J. T. Johnston, Batesville, was chosen president elect of the Arkansas Medical Society at its recent annual meeting in Hot Springs National Park. Dr. George B. Fletcher, Hot Springs National Park, was installed as president. Vice presidents are Drs. Arthur G. Sullivan, Hot Springs National Park; Ruth J. Ellis, Fayetteville, vice president, and Bonny M. Stevenson, West Memphis. Drs. Royal J. Calcote, Little Rock, and William R. Brooksher, Fort Smith, are treasurer and secretary respectively.

**Society News.**—At a meeting of the Second Councilor District Medical Society in Heber Springs, April 13, speakers included Drs. Lee Vallette, Parmley on fractures; Joseph H. Sanderlin, trichomonas vaginalis vaginitis; Raymond C. Cook, ocular manifestations of some systemic diseases, and Darmon A. Rhinehart, radiation in the treatment of fibroid tumors and menorrhagia from other causes. All are from Little Rock.—Members of the Sebastian County Medical Society presented the program of the Pulaski County Medical Society, April 13: Drs. Arthur F. Hoge and Charles T. Chamberlain, Fort Smith, spoke on "Surgery in Diabetes" and "Venous Pressure" respectively.—The Southeast Arkansas Medical Society was addressed at Lake Village, April 13, by Drs. Joseph F. Shuffield, Little Rock, on "Treatment of Fractures" and Guy C. Jarratt, Vicksburg, "Pyuria in Children."

### DISTRICT OF COLUMBIA

**Medical Bill in Congress.**—H. R. 12424 has passed the House, providing for the examination and registration of beauty culturists in the District of Columbia.

**The Davidson Lecture.**—The competition to select the person to deliver the annual Davidson Lecture is open, the Medical Society of the District of Columbia announces. Physicians and scientists working in the District are eligible. Essays must be signed by a nom de plume, and the identification of the author sealed in an envelop bearing on its surface the same nom de plume. The essay must not have been previously published and must be submitted to the secretary of the district society, 1718 M Street, N. W., Washington, not later than July 1, 1937. The executive committee of the society in January decided to select the Davidson lecturer in this manner rather than by nomination as it was done formerly. The lecture is named in honor of Dr. Edward Young Davidson, who was largely responsible in bringing to completion the society's project of building its own home.

### GEORGIA

**State Medical Election.**—Dr. George A. Traylor, Augusta, was chosen president-elect of the Medical Association of Georgia at the annual meeting in Savannah, April 24, and Dr. Benjamin H. Minchew, Waycross, was installed as president. Vice presidents are Drs. Cornelius F. Holton, Savannah, and James B. Kay, Byron. The next annual meeting will be held in Macon.

### ILLINOIS

**District Meeting.**—The sixty-second annual meeting of the District Medical Society of Central Illinois was held in Springfield, April 21. Clinics at St. John's Hospital were conducted by Drs. Charles B. Reed and Dallas B. Phemister, Chicago, and Ralph A. Kinsella, St. Louis. Others on the program included:

Dr. Frederick W. Light Jr., Springfield, The Importance of Biopsy in Diagnosis.  
Dr. Perry J. Melnick, Decatur, Accurate Diagnosis in Lymph Node Enlargements.  
Drs. Stuart Broadwell Jr. and Emil L. Bernard, Springfield, Treatment of Stricture of the Esophagus.  
Dr. Frank Jirka, state health director, Springfield, Public Health Problems.  
Dr. Rolfand L. Green, Peoria, Problems in Internal Medicine.  
Drs. William J. Morginson and Gerald C. Hunt, Springfield, Diseases of the Skin.  
Drs. Samuel N. Clark, Jacksonville, Early Manifestations of Mental Disorder.  
Howard J. Shaughnessy, Ph.D., Springfield, Answers to Questions on Interpretation of Laboratory Reports.

**Society News.**—Dr. Frederick A. Willis, Rochester, Minn. discussed "Coronary Disease with Special Reference to Prognosis in Coronary Thrombosis" before the Peoria City Medical Society, April 21. Dr. Dean Lewis, Baltimore, addressed the society, May 5, on "Endothelial Tumors."—Dr. Gershom J. Thompson, Rochester, Minn., addressed the Stephenson County Medical Society at Freeport, April 9, on "Diseases of the Prostate Gland."—Dr. Guy M. Cushing, Chicago, read paper before the Will-Grundy County Medical Society, May 1, entitled "Acute Perforating Ulcer."—At a meeting of the Henry County Medical Society, May 14, Dr. Raymond W. McNealy, Chicago, spoke on "Biliary Tract Disease from the Surgical Aspect," and Dr. Andrew C. Ivy, Chicago, "Therapy of Biliary Tract Disease from the Viewpoint of Applied Physiology."—At a meeting of the St. Clair County Medical Society in East St. Louis, May 7, Dr. Vincil Rogers Deaki St. Louis, discussed the Corbus-Ferry vaccine for the treatment of gonorrhea.

### CHICAGO

**Hobby Exhibit.**—Members of the staff of the Illinois Masonic Hospital held their first annual hobby exhibit as feature of National Hospital Day, May 12. The exhibit included flowers grown by Dr. John R. Harger; cartoons by Dr. Clifton K. Timmons, and war souvenirs by Drs. James J. Griffin, superintendent of the hospital, and Merritt Owen W. kins. Dr. Carl F. Steinhoff displayed figures of his drum and bugle corps, fashioned from papier-mâché.

**Society News.**—At a meeting of the Chicago Pathologic Society, May 11, Dr. Rudolph Kronfeld spoke, among others on "Histopathology of Dental Infections" and Drs. Hova Zeitlin and Ben W. Lichtenstein, "Cysts of the Third Ventricle with Colloid-like Contents."—The Chicago Society of Allergy was addressed, May 18, by Drs. Ralph H. Scull and Francis L. Foran on "Hypersensitiveness in Chronic Flexural Eczema: A Study of Fifty-Five Cases"; Townsend B. Friedman, "Allergy in Children," and Leon Unger, "Asthma in Children: Results of Treatment."—At a meeting of the maternal welfare committee of the Chicago Gynecological Society, May 1, the theme for discussion was "Deaths in 1934 Following Forceps Delivery," presented by Dr. Emil A. Rach.

**Remington Medal Awarded to Professor Gathercoal.**—Edmond Norris Gathercoal, professor of pharmacognosy, University of Illinois School of Pharmacy, has been awarded the Remington Medal for 1936 in recognition of his service as chairman of the revision committee of the National Formulary VI, his work in promoting higher standards for pharmaceutical products, for research in pharmacognosy and for his many years of service as a teacher. After graduation from the University of Illinois College of Pharmacy in 18 he entered Rush Medical College, but circumstances prevented completion of the course. He has served on the revision committee of the U. S. Pharmacopeia and has been chairman of the revision committee of the National Formulary since 192. The medal is presented annually by the New York branch of the American Pharmaceutical Association.

### INDIANA

**Hospital News.**—A supervoltage x-ray machine for the treatment of cancer has recently been installed in St. Joseph's Hospital, South Bend, costing \$225,000. The machine generates 400,000 volts of electricity.

**Northern Tri-State Meeting.**—Dr. William H. Marshall, Flint, Mich., was chosen president of the Northern Tri-State Medical Association at its sixty-third annual meeting in Fort Wayne, April 14. Other officers are Drs. Glenn E. Jones, Lima, Ohio, vice president; Robert H. Elrod, Toledo, Ohio, secretary. The 1937 meeting will be held in Jackson, Mich. Papers were presented by the following physicians:

Max M. Peet, Ann Arbor, Splanchnic Section for the Treatment of Hypertension.  
Robert M. Moore, Indianapolis, Conditions Which Occasionally Resemble Coronary Occlusion.  
Archibald L. Hoynes, Chicago, Progress in the Management of Contagious Disease.  
Anton J. Carlson, Chicago, Mechanism of Control of the Endocrine Glands.  
William E. Lower, Cleveland, The Prostatic Question.  
Claude F. Dixon, Rochester, Minn., Increasing Curability of Colonic Carcinoma.  
Louis H. Segar, Indianapolis, Recent Advances in Pediatrics.  
Heinrich A. Reye, Detroit, Importance of the Physician as a Marriage Counselor.  
Clifford J. Barborka, Chicago, A Practical Discussion of Treatment by Diet.  
Ferris Smith, Grand Rapids, Reconstructive Surgery.  
Claude S. Beck, Cleveland, The Heart as a Surgical Organ (motion pictures).

## KANSAS

**Personal.**—Dr. Otis B. Wyant, Winfield, was guest of honor at a banquet, April 2, given by the Cowley County Medical Society to observe his completion of fifty years in the practice of medicine; he was presented with a fifty year gold membership medal.

**Annual Spring Assembly.**—The Sedgwick County Medical Society conducted its annual spring assembly in the Allis Hotel, Wichita, April 14. Members of the society and the staff of the Sedgwick County Hospital presented the clinics. Guest speakers were Drs. John W. Duncan, clinical professor of surgery, Creighton University School of Medicine, Omaha, on "Carcinoma of the Breast," and Maurice C. Howard, associate professor of medicine at Creighton University, on "The Irregular Heart."

## KENTUCKY

**Society News.**—Dr. John Walker Moore, dean, University of Louisville School of Medicine, addressed the Louisville Medico-Chirurgical Society, April 24, on "Effect of Heat Upon the Circulation of Normal and Abnormal Individuals."—Dr. Stephen C. McCoy, Louisville, addressed the Jefferson County Medical Society, April 6, on "Urinary Tract Injuries."

**Death Rate Declined in 1935.**—The general death rate in Kentucky declined slightly from 11.4 in 1934 to 11.1 in 1935, and the rates for several important causes of death were reduced, according to the state health department. The infant death rate fell from 68.2 in 1934 to 63.4 in 1935. Heart disease caused 5,260 deaths in 1935, 5,456 in the previous year; cancer caused 1,959 last year, compared with 1,989 in 1934. The number for pneumonia fell from 2,400 to 2,273. The diphtheria death rate decreased from 13.6 in 1934 to 10.3 in 1935; that for typhoid from 11.1 to 9.1. Automobile accidents caused 666 deaths as compared with 649 the previous year.

## MARYLAND

**Hospital News.**—Dr. Walter Bauer, Boston, addressed the staff of University Hospital, Baltimore, March 16, on hypertrophic arthritis.

**New Venereal Disease Clinic.**—The Baltimore health department opened a clinic for the treatment of syphilis in colored women patients, January 7. The new unit will cooperate with the antepartum clinic conducted in the same building by the maternity division of the bureau of child hygiene.

**Conference of Health Officers.**—The sixteenth annual conference of health officers and boards of health of Maryland was held in Baltimore, May 8. Speakers included Dr. Robert H. Riley, director, Maryland State Department of Health, and the governor, Harry W. Nice. In addition, the following physicians, among others, spoke:

Clifford E. Waller, assistant surgeon general, U. S. Public Health Service, Social Security Act in Its Relation to Public Health.  
Lloyd D. Felton, Baltimore, Present Status of Treatment of Pneumonia.  
Albert S. McCown, Washington, D. C., Maternal and Child Health in Relation to the Social Security Act.  
George H. Ramsey, Albany, N. Y., Modern Methods for the Control of Syphilis.  
William Ross Cameron, Hagerstown, Problem of Typhoid Carriers with Special Reference to Recent Outbreaks.

Dr. Huntington Williams, commissioner of health of Baltimore, and Mayor Howard W. Jackson were on the program.

## MASSACHUSETTS

**Society News.**—Dr. Clifford L. Derick, Boston, addressed the Worcester North District Medical Society in Fitchburg, April 22, on "Staphylococcus Infection and Its Treatment."—A paper on "Frontal Bone Osteomyelitis" by Drs. Charles A. Croissant, Philip H. Cook and John F. Wonson was presented before the Worcester District Medical Society in Worcester, April 8.—Dr. Abraham Myerson, Boston, addressed the New England Society of Psychiatry in East Gardner, April 22, on "The Neuroses."

**Dr. Hunt Honored.**—Dr. Reid Hunt, who is retiring this year as professor of pharmacology at Harvard Medical School, Boston, was guest of honor at a gathering in the Harvard Club of Boston, April 20, in celebration of his sixty-sixth birthday. Dr. C. Sidney Burwell, dean of the medical school, was toastmaster; speeches were made by A. Lawrence Lowell, LL.D., James F. Norris, Ph.D., Drs. Ross G. Harrison, New Haven, Conn., Ko K. Chen, Indianapolis, William Worth Hale and Gustave Philip Grabfield, Boston. Presentation was made of an etched portrait of Dr. Hunt, which will hang in the medical school.

**Portrait of Dr. Keep.**—A portrait of Dr. Nathan Cooley Keep, a graduate of Harvard Medical School and the first dean of the Harvard Dental School, was unveiled in Vanderbilt Hall of the university, April 3, as a special feature of the annual Alumni Day celebration or joint clinical meeting of the Harvard Dental Alumni Association and the Harvard Odontological Society. The portrait was the gift of the artist, Mrs. Marie Danforth Page, whose husband is a grandson of Dr. Keep, and it was unveiled by Miss Elizabeth Keep, the great-granddaughter of Dr. Keep. Dr. Keep graduated from the medical school in 1827. He assisted in the founding of the Massachusetts Dental Society, serving as its first president.

## MICHIGAN

**Medical Museum.**—A museum of old surgical instruments and medical appliances has been established in the University Hospital, University of Michigan School of Medicine, Ann Arbor. Dr. Frederick A. Collier, professor of surgery at the medical school, is soliciting objects which may be given or loaned.

**Committee to Study Medical Jurisprudence.**—A joint committee of physicians and attorneys was appointed, March 18, by the state bar association and the Michigan State Medical Society to consider problems of medical jurisprudence. Members of the committee are: Drs. Alpheus F. Jennings and Charles S. Kennedy, Detroit; Robert H. Denham, Grand Rapids; Clifford W. Brainard, Battle Creek, and attorneys Miles H. Knowles and Herbert V. Barbour, Detroit; G. Douglas Clapperton, Grand Rapids; Francis F. Shields, Howell, and Claude W. Coates, Sault Ste. Marie.

## MINNESOTA

**Dr. Maxcy Named Head of Department.**—Dr. Kenneth F. Maxcy, professor of preventive medicine and bacteriology, University of Virginia School of Medicine, Charlottesville, has been appointed professor of preventive medicine and public health and head of the department at the University of Minnesota School of Medicine. He succeeds Dr. Harold S. Diehl, who last year was appointed dean of the medical sciences. Dr. Maxcy graduated from Johns Hopkins University School of Medicine in 1915. He represented the U. S. Public Health Service at the malaria conference of the League of Nations in Geneva in 1928.

## MISSISSIPPI

**Society News.**—A motion picture on traumatic surgery formed the program of the Coahoma County Medical Society and the medical staff of the Clarksdale Hospital recently in Clarksdale.—The East Mississippi Medical Society was addressed in Meridian recently by Drs. Franklin G. Riley, Meridian, on "Pyelonephritis in Children," and Chalmers H. Moore, Birmingham, Ala., "Scope of Neurosurgery."—A paper by Dr. Archie E. Gordin, Jackson, on "Present Status of Gynecology Compared with Gynecology Twenty Years Ago" was read before the Issaquena-Sharkey-Warren Counties Medical Society in Vicksburg recently by Dr. Albert Gayden Ward, Jackson.—Dr. J. Rice Williams, Houston, discussed "Diagnosis and Treatment of Cancer" before a recent meeting of the Pontotoc County Medical Society.

## MISSOURI

**Dinner in Honor of Dr. Ewing.**—Dr. James Ewing, New York, was guest of honor at a dinner in St. Louis, recently, given by the board of directors and woman's auxiliary board of the Barnard Free Skin and Cancer Hospital. Dr. Ewing addressed the dinner meeting on "Responsibility of the Public in Cancer Service."

**State Medical Election.**—Dr. Dudley S. Conley, dean of the University of Missouri School of Medicine, Columbia, was chosen president of the Missouri State Medical Association at its recent annual meeting in Columbia, and Dr. Ross A. Woolsey, St. Louis, was installed as president. The next annual meeting will be held in Cape Girardeau.

**Society News.**—At a meeting of the Jackson County Medical Society, April 7, speakers were Drs. James Q. Chambers Jr. on "Geriatrics—Diseases of Old Age"; Radford F. Pittam, "Carotid Denervation in Cerebral Angiospasm," and Clarence E. Sanders, "Dynamics of the Circulation." All are from Kansas City.—Dr. Roy Glenwood Spurling, Louisville, discussed epilepsy at a meeting of the Kansas City Academy of Medicine recently.—At a meeting of the St. Louis Trudeau Club and the St. Louis Medical Society, April 7, Dr. Henry C. Sweany, Chicago, discussed "Pathogenesis of Pulmonary Tuberculosis."—Dr. Charles Macfie Campbell, Boston, addressed a joint

meeting of the St. Louis Medical Society and the Missouri Society for Mental Hygiene, May 3, on mental health.—The St. Louis Medical Society was addressed, March 17, by Drs. Roland M. Klemme on "Trigeminal Neuralgia—Accurate Differential Section"; Fred W. Bailey, "The Threat of Neglected Cholelithiasis," and Edward V. M. Mastin, "Shoulder and Clavicular Pain in Appendicitis."

**Conference of Social Work.**—Social and economic security was the theme of the meeting of the Kansas Conference of Social Work with the Missouri Association for Social Welfare at the Hotel Muehlebach, Kansas City, April 2-4. The speakers included:

- Dr. William J. Stewart, surgeon, state crippled children's service, University Hospitals, Columbia, Administration of the Social Security Law in Missouri.
- Dr. Paul J. Zentay, St. Louis, *The Social Worker and the Problem Child*.
- Dr. George Wilse Robinson Jr., Kansas City, *The Effects of the Depression on the Mental Life of the Child*.
- Dr. Ralph I. Canuteson, Lawrence, Kan., *The Tuberculosis Problem in Student Health Service*.
- James H. Scott, chairman, state board of administration, Topeka, Kan., *Cooperation of Private and Public Agencies with Parole, Probation and Prison Authorities*.
- Dr. Karl A. Menninger, Topeka, *Social and Economic Factors Relating to Personal and Family Life*.

## NEW YORK

**Study of Nutrition in Adult Life.**—A six year study of the rôle of diet in the last half of adult life will be undertaken at the New York State College of Agriculture at Cornell University, Ithaca, Dr. Livingston Farrand, president of Cornell, recently announced. The Rockefeller Foundation has given \$42,500 to support the study for six years. The new investigation was suggested by an observation that the diets which promote rapid growth in young rats were antagonistic to longevity and that the life span of the animals was increased by diets low in calories, diets the opposite of the optimal feeding for growth of the young.

**Academy Honors Dr. Potter.**—At the annual dinner of the Buffalo Academy of Medicine and the Medical Society of the County of Erie, April 3, the academy presented a gold medal to Dr. Irving W. Potter, who has practiced in Buffalo for forty-five years, thirty years as a specialist in obstetrics. Dr. Allen Jones made the presentation and brief addresses were made by Dr. James Herbert Donnelly, president of the academy, and Dr. Milton G. Potter, president of the county medical society and son of the guest of honor. The medal bears on its face an engraving of Dr. Potter and on the reverse side an inscription. Dr. Potter is a native of Buffalo and was graduated from the University of Buffalo School of Medicine in 1891.

**Supervision of Typhoid Carriers.**—Fifty new typhoid carriers were registered in upstate New York during 1935, exclusive of those in state institutions. Twenty-four were removed from the register, leaving 361 under supervision Dec. 31, 1935. Forty-one of the new carriers were discovered through investigation of sporadic cases of typhoid, six through the requirement of release cultures from cases of typhoid, two on evidence submitted by other health departments, and one through examination of bile obtained during an operation. Of those removed from the list, fifteen died, five were released after negative tests following cholecystectomy, and four moved outside the jurisdiction of the state department of health. Four per cent of the persons who were reported as having typhoid in 1934 and having recovered have been found to be chronic carriers, *Health News* reported. One outbreak of seven cases of typhoid was traced to a carrier during 1935.

## New York City

**Mental Status of Criminals.**—Of 2,590 offenders examined in the psychiatric clinic of the Court of General Sessions within the past year, less than 1 per cent were found to be definitely insane, according to a report by Drs. Walter Bromberg and Charles B. Thompson of the psychiatric division of the department of hospitals. Of that number 228 were classified as "immature adolescent"; 150 "weak-willed and suggestible"; 129 as "neurotic"; 162 as "unstable and impulsive" and 396 as "aggressively antisocial." Intelligence tests resulted as follows: 1,572, or about 60 per cent, average or low average intelligence; 220, intelligence above the average, and the remainder below. Mentally defective offenders numbered only fifty-seven. Native born persons made up 77 per cent of the total. Twenty-three per cent of the group were between 16 and 20 years of age.

**Report of the Diabetes Association.**—The New York Diabetes Association, which functions as a committee of the New York Tuberculosis and Health Association, has issued its

first annual report. The association has organized the following committees: internal medicine, surgery, statistics and department of health relations, lay education, lay committee, apparatus and the professions of nursing, social service and dietetics. Among the year's activities described are: a survey of diabetic clinics in the city, from which a directory was compiled; preparation of pamphlets on diabetes for physicians and laymen; studies of nostrums and apparatus; studies of diabetes incidence; investigation of the amount of insulin sold in the United States. A committee on podiatry has collected material relating to the care of the feet in diabetic persons and is now working toward specific recommendations on the subject. Arrangements have also been made for organization of a committee on dentistry.

**Personal.**—Dr. Marshall C. Balfour, representative in Greece of the International Health Board of the Rockefeller Foundation, has been awarded the silver medal for distinguished services by the Greek Academy of Sciences, Arts and Letters, in recognition of research in the field of malaria control in the Peloponnesus and in the Macedonian towns of Drama and Cavall.—Dr. Frank Fremont-Smith, until recently assistant professor of neuropathology, Harvard Medical School, Boston, has been appointed in charge of the medical division of the Josiah Macy Jr. Foundation.—Dr. Anna W. Williams, for many years assistant director of the laboratories of the New York City Department of Health, was presented with a testimonial scroll by the Women's Medical Society of New York State at its annual dinner, April 27, "in recognition of her forty years' service to New York City and work in advancing the cause of the woman doctor."—Dr. David Seegal has been appointed to fill the newly created position of director of the research division of chronic diseases in the city department of health.—Dr. Girolamo Bonaccolto has been appointed assistant professor of clinical ophthalmology at Columbia University College of Physicians and Surgeons.

## NORTH CAROLINA

**Personal.**—Dr. Isaac R. Wagner, head of the Veterans' Administration Facility at Memphis, Tenn., has been transferred to the facility at Oteen.

**Society News.**—Speakers at a meeting of the Mecklenburg County Medical Society, Charlotte, April 7, were Drs. Clyde C. Phillips, on "Irradiation Therapy in Uterine Bleeding from Causes Other than Cancer"; James R. Adams and George Preston Nowlin, "Atresia of the Vulva," and Edward J. Wannamaker Jr., "Insulin."

## OHIO

**Ten Year Diphtheria Record.**—A recent study of the occurrence of diphtheria in Ohio during the past ten years showed that an average of 61 cases per hundred thousand of population, a death rate of 4.4, had been reported. Twenty-one cities had no deaths from diphtheria during the period. Thirty-one had case or death rates higher than the average; these included the four largest cities, Cleveland, Cincinnati, Toledo and Columbus. Case rates were 98, 64, 53 and 81, respectively, for these cities, and the death rates were 8.5, 4.1, 4.7 and 3.8, respectively.

**Graduate Course at Youngstown.**—The Mahoning County Medical Society presented its ninth annual Post Graduate Day in Youngstown, April 30. The guest lecturers, all of New York, gave two lectures each during the day, as follows:

- Dr. Walter W. Palmer, *Thyroid Function and the Low Basal Metabolic Rate; Problems in the Medical and Surgical Treatment of Hyperthyroidism*.
- Dr. Dana W. Atchley, *The Nephrotic Syndrome; The Rôle of Peripheral Circulatory Failure in Medicine*.
- Dr. Allen O. Whipple, *Recent Advances in Surgery of the Pancreas; Medical and Surgical Treatment of Thrombocytopenic Purpura*.
- Dr. Alvan L. Barach, *Therapeutic Use of Helium in Asthma and Obstructive Lesions in the Larynx and Trachea; Recent Advances in Treatment of Pulmonary Edema, Cough and Dyspnea*.

**Health Projects in Social Security Program.**—The state director of health, Dr. Walter H. Hartung, has appointed an advisory council to assist in the administration of Ohio's program under the maternal and child health provisions of the social security act. It is expected that the program will be largely educational, including antepartum instruction to mothers and "refresher" courses in obstetrics and pediatrics for physicians. Members of the council are:

- Dr. John H. J. Upham, *President-Elect of the American Medical Association and dean, Ohio State University College of Medicine, Columbus*.
- Dr. Albert Graeme Mitchell, *professor of pediatrics, University of Cincinnati College of Medicine, Cincinnati*.
- Dr. Elmer G. Horton, *professor of pediatrics, Ohio State University College of Medicine, Columbus*.

Dr. Henry J. Gerstenberger, professor of pediatrics, Western Reserve University School of Medicine, Cleveland.  
Dr. Richard A. Bolt, director, Cleveland Child Health Association.  
Dr. Sterling H. Ashmun, Dayton, state chairman, American Academy of Pediatrics.  
Ewing V. Burns, D.D.S., Findlay, formerly president, Ohio State Dental Association.  
Dr. Willoughby D. Bishop, Greenville, secretary, Ohio Federation of Public Health Officials.  
Dr. Arthur J. Skeel, Cleveland, representing the Association of Obstetricians and Gynecologists.  
Dr. Walter W. Brand, Toledo, vice president, Hospital Obstetric Society of Ohio.  
Dr. Scott C. Runnels, Cleveland, representing the American Committee on Maternal Welfare.  
Mrs. Elizabeth T. August, R.N., Columbus, secretary, Ohio State Nurses' Association.

Funds available under this part of the act will amount to \$102,719.34 annually, according to the *Ohio State Medical Journal*. Under title VI of the act Ohio will receive \$285,100 this year for aid to local health districts. This part of the program will be under the direction of Dr. Reaves W. DeCrow, Columbus, chief of the bureau of health organization, state department of health. An application is pending for funds to enlarge the bureau of occupational diseases, which is directed by Dr. Emery R. Hayhurst, Columbus.

### SOUTH CAROLINA

**State Medical Election.**—Dr. Julius H. Taylor, Columbia, was chosen president-elect of the South Carolina Medical Association at the annual meeting in Greenville, and Dr. Robert C. Bruce, Greenville, was installed as president. Dr. Edgar A. Hines, Seneca, who has served as secretary for twenty-six years, was reelected. The next annual meeting will be held in Columbia.

### TENNESSEE

**State Medical Election.**—Dr. Wilson L. Williamson, Memphis, was chosen president of the Tennessee State Medical Association at its recent annual meeting in Memphis, succeeding Dr. John B. Steele, Chattanooga. Vice presidents are Drs. John E. Powers, Jackson; James O. Walker, Franklin, and Lee K. Gibson, Johnson City. Dr. Harrison H. Shoulders, Nashville, was reelected secretary. Knoxville was designated as the place for the next annual meeting, April 13-15, 1937.

**Society News.**—The following Memphis physicians addressed the Tri-County Medical Society (Carroll, Henry and Weakley counties), McKenzie, recently, as follows: Drs. Hubert K. Turley, on "Pyelitis of Pregnancy"; Frank W. Smythe, "Diagnosis of Intestinal Obstructions"; James B. Stanford, "Disease of the Eye," and Conley H. Sanford, "Modern Trends in Treatment of Lobar Pneumonia."—Drs. Arthur G. Quinn and Jerome P. Long Jr., Memphis, presented papers before the Memphis and Shelby County Medical Society, April 7, on "Classification of Diseases in the New-Born" and "Antepartum Hemorrhage" respectively.

### TEXAS

**Personal.**—Dr. John S. Cooper, Greenville, has been appointed city health officer to succeed Dr. Benjamin F. Arnold.—Dr. Charles D. Lipscomb, Quitman, was appointed health officer of Wood County, April 16.

**Society News.**—At a meeting of the Dallas County Medical Society, May 14, Drs. Charles W. Flynn and Hardy A. Kemp discussed "Problems in Gastric Surgery with Special Reference to Gastric Cancer" and "Certain Applications of the Bacteriology of the Brucella Group to the Clinical Problems of Brucellosis."

**Old Age Assistance Plan.**—The Social Security Board has approved the Texas old age assistance plan. Under this plan, which will go into effect June 1, it is estimated that 60,000 needy aged persons will be eligible for assistance and that the monthly cost will be about \$1,200,000 on the basis of an average monthly grant of \$20 per person. The program will be administered through the twenty district offices of the Texas Old Age Assistance Commission.

### VIRGINIA

**University News.**—Dr. Arnold R. Rich, Baltimore, gave the Alpha Omega Alpha Lecture at the University of Virginia Department of Medicine, recently, on "Immunity in Tuberculosis." Alfred Chanutin, Ph.D., professor of biochemistry, received the Edward N. Gibbs prize of the New York Academy of Medicine for the third consecutive year; the stipend is to be applied to research on diseases of the kidney.

**Personal.**—The board of managers of the Virginia Home for Incurables, Richmond, gave a reception in honor of Dr. Henry Ward Randolph, head of the medical staff of the

institution. He was presented with a large silver platter, in recognition of his more than twenty-five years' service with the hospital.—The staff of the Eastern State Hospital, Williamsburg, gave a reception in honor of the superintendent, Dr. George W. Brown, celebrating his twenty-fifth anniversary in that position.

### WASHINGTON

**Health at Tacoma.**—Telegraphic reports to the U. S. Department of Commerce for the week ended May 9 from eighty-six cities with a total population of 37 million indicate that the highest mortality rate (21.5) appears for Tacoma and that the rate for the group of cities as a whole is 12.6. For the corresponding period last year the rate was 12.4 for Tacoma and 12 for the group of cities. The annual rate for eighty-six cities for the nineteen weeks of 1936 was 13.5 as against a rate of 12.6 for the corresponding period of the previous year. Caution should be used in the interpretation of these weekly figures, which show wide fluctuations. The fact that some cities are hospital centers for large areas outside the city limits or that they have a large Negro population may tend to increase the death rate.

### WISCONSIN

**Medical Society Film.**—The Medical Society of Milwaukee County is preparing a motion picture film portraying all the activities of the society, under the direction of Dr. Herman A. Heise. The necessary equipment for the picture will be provided by members of the society.

**University News.**—Dr. John H. Skavlem, Cincinnati, addressed the University of Wisconsin Medical Society, March 31, on "Basic Points in Roentgen Ray Studies of Anatomy and Pathology of the Lung." Dr. Frank J. Hirschboeck, Duluth, Minn., spoke at the medical school convocation, recently, on "The Nervous Patient."

**William Snow Miller Lecture.**—Dr. Arno B. Luckhardt, professor of physiology, University of Chicago, gave the ninth William Snow Miller Lecture at the University of Wisconsin, April 17. His subject was "A Neglected Chapter in the History of Anatomy Illustration and Instruction." The William Snow Miller Lectureship was established in 1928 by the Phi Beta Pi fraternity. It is given near the time of Dr. Miller's birthday, March 29.

**Society News.**—Speakers before the Medical Society of Milwaukee County, April 10, were Drs. Newell C. Gilbert, Chicago, on "Relation of the General Practitioner to Clinical Investigation"; James C. Sargent, Milwaukee, "Hydronephrosis: A Clinical Study of the Structural Involution That Follows Release of Obstruction," and John L. Yates, Milwaukee, "Cancer Cell Antigens: Their Practical Suggestions."—Dr. Palmer W. Good, Kenosha, addressed the Milwaukee Oto-Ophthalmic Society, March 10, on "Testing the Visual Acuity of the School Child." Dr. William E. Grove, Milwaukee, addressed the society, April 14, on "Septic and Aseptic Types of Cavernous Sinus Thrombosis."

**Federal Funds for Graduate Courses.**—Federal authorities have approved the use of funds released to the state board of health under the social security act to provide graduate courses in obstetrics and pediatrics for practicing physicians in Wisconsin. At a recent meeting of representatives of the state board of health, the State Medical Society of Wisconsin and the University of Wisconsin Medical School, two courses were tentatively outlined to begin about May 15 in circuits of five centers each. The instructional staff will be chosen from the faculty of the medical school. Funds have been made available only until June 30, but it is expected that appropriations will be made for continuation of this work during the next fiscal year.

### GENERAL

**Academy Exhibit.**—The American Academy of Ophthalmology and Otolaryngology announces that a scientific exhibit will be a part of its meeting in New York, September 26-October 3. Applications for space should be sent direct to Dr. Samuel J. Kopetzky, 51 West Seventy-Third Street, New York, for otolaryngology, and Dr. Ralph I. Lloyd, 14 Eighth Avenue, Brooklyn, for ophthalmology.

**Number of Defectives Sterilized.**—The Human Betterment Foundation recently reported that, up to January of this year, 23,092 insane and feeble-minded persons had been sterilized in the twenty-eight states having sterilization laws. More than 10,000 operations have been performed in California. Other states that had reported more than 1,000 sterilizations each were Kansas 1,509, Michigan 1,555, Minnesota 1,154, Oregon 1,047 and Virginia 2,386.

**Society News.**—The Pan-Pacific Surgical Congress will be held in Honolulu, August 6-14. An excursion has been planned to leave San Francisco July 31 and return August 22 to include the congress. Information may be obtained from Dr. George W. Swift, 902 Boren Avenue, Seattle, president of the congress. —Dr. Nathan C. Foot, New York, was elected president of the American Association of Pathologists and Bacteriologists in Boston, April 9; Dr. Earl B. McKinley, Washington, D. C., vice president, and Dr. Howard T. Karsner, Cleveland, secretary. The next annual meeting will be held at Northwestern University Medical School, Chicago, March 25-26, 1937.

**Automobile Accidents in Cities in 1935.**—Eighty-six cities with an estimated population of thirty-seven million reported 8,799 deaths from automobile accidents in 1935 as compared with 9,060 deaths in 1934, according to the bureau of the census of the U. S. Department of Commerce. Forty-eight of the eighty-six cities showed a decrease in the total number of fatalities from automobile accidents, thirty-six showed increases, and two cities reported the same number of deaths in 1935 as in 1934. Decreases are evident in fatality rates for Utica, N. Y., Salt Lake City, Lynn and Fall River, Mass., while increases are shown for Nashville, Tenn., Paterson, N. J., Youngstown, Ohio, Fort Wayne, Ind., and San Diego, Calif.

**Medical Bills in Congress.**—*Changes in Status:* S. 3334 has been reported to the House, providing for the care and treatment of members of the National Guard, Organized Reserves, Reserve Officers' Training Corps, and Citizens' Military Training Camps who are injured or contract disease while engaged in military training. S. 4390 has passed the Senate, providing that appointments to the Medical Administrative Corps shall be restricted to pharmacists who are graduates of recognized schools or colleges of pharmacy requiring four years of instruction for graduation, and further providing that the number of such pharmacists in the corps shall not exceed sixteen. *Bills Introduced:* S. 4627, introduced by Senator Barkley, Kentucky, proposes to create in the Bureau of the Public Health Service a Division of Stream Pollution Control.

**Changes in Status of Licensure.**—The Wisconsin State Board of Medical Examiners has reported the following action: Isaac Monroe Brown, whose last known address was New London, Wis., license revoked on reading of court records for performing of illegal operations.

The New Jersey Board of Medical Examiners has reported the following action:

Luis E. Viteri, Ambato, Ecuador, S. A., and Leslie F. Clary, Kings Park, licenses revoked recently for failure to present evidence of having become citizens of the United States.

The State Medical Board of Ohio reported the following action:

License of Elam L. Falvey, who took his medical course and received licenses to practice in Texas and Ohio under the name of Arthur L. Keyes, revoked January 7. His Texas license was revoked in 1935. Falvey was indicted in Ohio in October 1935 for filing with the state medical board a false affidavit of identity. At his trial in December he pleaded guilty and was sentenced to a year of probation, required to leave the state and to surrender his license.

The Board of Medical Examiners of Maryland announces the following action:

Dr. Thomas Statham Sheppard, Millville, N. J., license revoked. Dr. Sheppard's license to practice medicine in New Jersey was revoked March 27, 1935, for his conviction on a charge of criminal abortion.

The Colorado State Board of Registration in Medicine reports the following:

Dr. Lewis J. Greenfield, Denver, license revoked, April 7, for violation of the Harrison Narcotic Act.

The Oregon state board of medical examiners has recently reported the following action:

License of Dr. Walter R. Anderson, Portland, which was revoked in 1933, was reinstated April 1.

License of Dr. Isaac D. Bartell, Dallas, revoked January 17, for unprofessional conduct.

The Maine Board of Registration in Medicine announces the following action:

Dr. Joseph R. Woolf, March 10, Portland, license revoked because of his conviction of violation of the Harrison Narcotic Act and for fraudulent buying and dispensing of morphine.

**Committees to Study Silicosis.**—Four committees were appointed by Secretary Perkins, May 2, to work out a method for ending silicosis, the New York Times reported. Heads of the committees are Dr. Royd R. Sayers of the U. S. Public Health Service, who has been placed in charge of the medical committee; Warren A. Cook of the Connecticut State Department of Health, Hartford, of the engineering committee; V. P. Ahearn, Washington, D. C., economic, legal and insurance, and L. M. Metcalfe Walling, Providence, R. I., labor commissioner, in charge of the regulatory and administrative committee. Fifty-three men have been named to comprise the committees,

including health experts, representatives of employers, workers, insurance companies, government, technical societies and engineers. Their appointment grew out of a national conference held to discuss the problem.

**Expenditures by Cities for Health Services.**—The Bureau of the Census recently issued a compilation of financial statistics of cities showing the total amounts spent for health service, the per capita amounts and the percentages of the appropriations for all departments in 1934, 1933 and 1932. Among cities with populations over 500,000, Detroit had in 1934 a per capita for health purposes of \$1.89, the highest of the group. Others were Boston \$1.83, Buffalo \$1.64, New York \$1.53, Cleveland \$1.51 and Milwaukee \$1.46. In the next group of cities, between 300,000 and 500,000 population, the highest were Newark, N. J., \$2.63; Rochester, N. Y., \$2.04; Jersey City, N. J., \$1.92; Minneapolis, \$1.85, and Seattle, \$1.46. Among cities with populations between 100,000 and 300,000 the highest per capita expenditures for health were in Yonkers, N. Y., \$2.01; Worcester, Mass., \$1.95; New Bedford, Mass., \$1.74; Somerville, Mass., \$1.67; Trenton, N. J., and Providence, R. I., \$1.61.

## HAWAII

**Personal.**—Alvin R. Lamb, Ph.D., formerly of the U. S. Public Health Service and the Leprosy Investigation Station, Honolulu, has become research associate at the Experiment Station of the Hawaiian Sugar Planters' Association, Honolulu, according to *Science*.

**Lectures on Cancer.**—Dr. Max Cutler, director of the tumor clinic of Michael Reese Hospital and associate in surgery, Northwestern University Medical School, Chicago, began a series of twelve lectures on cancer, May 2, under the auspices of the Hawaiian Society for the Control of Cancer, Honolulu. Dr. Cutler also addressed the annual meeting of the Territorial Medical Association in Honolulu, May 2-4.

## FOREIGN

**Information Bureau in Paris.**—A "Bureau of Medical Relations with Foreign Countries" has been opened at the University of Paris, where physicians and students may obtain information they desire concerning graduate courses and hospital services. Foreign students and physicians are invited to communicate with the bureau on their arrival in Paris.

**Association for Protection of Humanity in War.**—At a conference in Monaco, February 10-12, called by the medicolegal commission created by the permanent committee of the International Congresses of Military Medicine and Pharmacy, there was formed the Association for the International Protection of Humanity. The new association, which will have headquarters in Monaco, will have two objects: first, to work to restrain the use of force in international relations and, failing that, to subject the use of force to rules of law in accord with knowledge; and, second, to foster the growing respect not only for life and security but for the liberty and the dignity of human beings. It plans to work in association with other international associations and institutions for diminution of the suffering caused by war. The president is Ernest Mahaim, former president of the International Labor Bureau, and the general secretaries are Dr. J. Voncken, director of the International Office of Military Medicine, Liège, Belgium, and Albert de la Pradelle, professor in the faculty of law at the University of Paris. Forty-seven persons representing thirteen countries attended the February meeting in Monaco. For information address Dr. Voncken, Quai de Plaisance, Monaco.

## Deaths in Other Countries

**Robert Bárány**, professor of diseases of the ear, nose and throat, University of Upsala, Sweden, and winner of the Nobel prize in medicine in 1914, died April 8, aged 60. Dr. Bárány was a native of Austria and was appointed to the faculty of the University of Vienna in 1909. During the World War he was made prisoner by the Russians but was later released, according to the *New York Times*. He went to Upsala in 1917. He received the Nobel prize for his studies on the interior structure of the ear.

## CORRECTION

**Units of Vitamin D.**—In a footnote in the article by Vrtiak and Lang entitled "Observations on the Treatment of Chronic Arthritis with Vitamin D" (*THE JOURNAL*, April 4, page 1162), it was stated that the viosterol preparation contained the equivalent of 850,000 units of vitamin D per gram. This is an error. The footnote should have read 1,000,000 units per gram.

#### Nutrition and National Health

Sir Robert McCarrison delivered to the Royal Society of Arts three lectures on nutrition and national health. He said that the greatest single factor in the acquisition and maintenance of good health is perfectly constituted food. The level of the physical efficiency of the Indian races was, above all else, a matter of diet. No other single factor—race, climate, endemic disease, and the like—had so profound an influence on their physique. The physique of the races of northern India was strikingly superior to that of the southern, eastern and western races. The former lived on whole wheat, milk and milk products, vegetables and fruit; the latter, largely on rice, and inferior cereals which were further reduced in nutrient value by parboiling, milling or polishing, and they had little milk or milk products. Experiments on a large number of albino rats with these two diets showed a similar contrast. On the former diet they thrived and disease was completely absent. But if the milk was left out or reduced, respiratory and gastro-intestinal diseases began to appear, especially if the consumption of fresh vegetables was also limited. Rats were fed on a diet common among the poorer classes of England—white bread, margarine, oversweetened tea with little milk, boiled cabbage and boiled potato, tinned meat and cheap jam. This diet has many faults of which vitamin and mineral deficiencies are the chief. The rats did not increase in weight; their coats were lacking in gloss. They were nervous. They lived unhappily together and by the sixtieth day began to eat the weaker members. The experiment was continued for 190 days, a period which would correspond to about sixteen years in man. The survivors were then killed. Disease of the lungs was twice as common as in the properly fed group. Gastric ulcer, warty outgrowths of epithelium in the stomach, gastritis, enteritis and colitis were very frequent, while they were absent in the properly fed. These ailments are frequent among the similarly fed English as well as among the poorer Madrassi. Peptic ulcer was very common in the south of India and rare in the north.

The conspicuous fault of the diet of the British people, according to McCarrison, is the extensive use of vitamin-poor wheat flour and the inordinate use of vitaminless sugar. This gave rise to insufficiency of vitamin B in the diet, unless it was supplemented with a sufficiency of milk, eggs, fruits, nuts and vegetables. Other deficiencies were in first-class proteins, calcium, iron and vitamins A and D. The result was many forms of ill health and a variety of inflammatory and degenerative diseases.

#### Presentation to Sir Almroth Wright

In the library of the inoculation department of St. Mary's Hospital Sir Henry Dale unveiled a portrait bust of Sir Almroth Wright and presented it to him with a small book containing the following engrossed address from 250 colleagues:

"On the attainment of your 75th year, we, your colleagues, pupils and friends, take the opportunity of offering you a token of our esteem and our warm personal affection. We wish to commemorate your outstanding work in immunology, your development of vaccine therapy, and your founding of the inoculation department of St. Mary's Hospital, where, so far as in us lies, your work shall continue. We would commemorate, in particular, that scientific humbleness of heart and that freshness of vision which have helped you in unveiling the tangles of contemporary medical thought and which, throughout your career, have been an inspiration to your fellow workers."

Sir Henry Dale referred to the contrast between the toll which typhoid took in the South African War and the experience of the much greater conflict two decades ago, when one weapon was put out of action by the application of Wright's work. His results had not been obtained by random shots but from the building of a fabric of ingenious theories which gave logical coherence to the observations made, until sometimes his friends feared that he might overtax the resources of the Greek lexicon in devising a nomenclature to give precision to his ideas.

In reply, Sir Almroth Wright said that when people said that work was pleasant his reply was that they had not worked at anything worth while. It might be great fun to work in a laboratory and get results, but it was no fun to work in a laboratory and fail to get results. If any one came to him proposing to do medical research he asked: Have you counted the cost? Do you know how much disappointment there is in that work, and how little satisfaction? The best reward of work was the praise of one's compeers.

#### Bill to Prevent Unscrupulous Advertising

The very moderate bill to prevent only the worst forms of unscrupulous advertising of alleged remedies, described in previous letters to *THE JOURNAL*, has been lost. Its second reading was moved in the house of commons by Mr. G. A. V. Duckworth, who said that its provisions were approved by representatives of the proprietary medicines trade, the Advertising Association, the County Council Association, the Pharmaceutical Society and many other bodies. It sought merely to remove some of the worst abuses in the advertisement and sale of patent medicines and secret remedies. The report of a select committee of the house of commons showed the volume and growth of the traffic in patent medicines and the inadequacy of the law to protect the public from fraud. It emphasized the dangers to the public in advertising claims to cure diabetes, cancer, tuberculosis and other diseases listed in the bill. The report stated that such advertising had grown to enormous proportions and that agencies had been established in which the unscrupulous could buy thousands of names of persons suffering from these diseases. Reputable newspapers had now established a voluntary form of censorship, which excluded the worst type of advertisement, but all newspapers were not so particular. The public were still exposed to great frauds. In comparison to the protection given by law in other countries, and particularly in the British dominions, it might well be said that the bill did not go half far enough.

In seconding the bill Capt. G. S. Elliston referred to the long campaign of *Truth* against unscrupulous quacks which gave rise to the select committee mentioned, and to the publication by the British Medical Association of "Secret Remedies," which showed the shameless exploitation of sufferers. Lord Bledisloe had said: "Probably never has such a tissue of fraud and falsehood been disclosed by any parliamentary committee." Its report was made in August 1914 and lay dormant during the war, but it produced important results, as many newspapers put into effect some of its recommendations. The bill was sorely needed and long overdue.

The rejection of the bill was moved by Sir Arnold Wilson, who said that it tended unduly to restrict the activities of the unorthodox practitioner. The house should pause before it accepted the assumption that most remedies and alleviations not approved by the medical profession were fraudulent. He had received testimony from men and women, known to him for many years, that unorthodox remedies had done them good. The rest of his long speech was, like this, irrelevant to the issue. He even complained that the bill did not touch the so-called cures for asthma, bronchitis, influenza and the common cold.

After further opposition the small number of members present led to a count, and it was found that forty members were not

present. The house was therefore "counted out" and the bill lost. Thus in the words of the *British Medical Journal*, "a very hard piece of public-spirited work came to a miserable end." This deplorable result can be partly attributed to the suspicion of a large section of the public that when the medical profession opposes irregular practices it is actuated by selfish motives. One speaker was afraid that the bill was "designed to safeguard the business of qualified doctors and chemists far more than the health of the public." Propaganda of the usual misleading type was carried on outside the house against the bill and pressure brought to bear on members. The idea of freedom in this very free country goes far beyond anything known on the European continent and ends in license. It includes toleration of antivaccinators, bone-setters and all kind of quacks and even, as in this instance, "cancer curers." However, a bill of this kind is certain to be passed sooner or later, probably as a government measure. If this bill had been brought forward by the government the "counting out" would not have been possible.

### Thirty Million Gas Masks

The elaborate preparations for the protection of the civil population against attacks with poison gas, which are being announced from time to time, are a sad reflection on our boasted civilization. The latest are plans to train 77,000 members of the St. John Ambulance Brigade in antigas work. In this the Air Raids Precautions Department of the government will assist. Some thousands of men have already been trained and it is proposed to train women. The public baths in London may be used as decontaminating centers. It is also proposed to supply antigas containers for babies in the event of war. Work on the mass production of 30,000,000 gas masks, which will be distributed free in the event of war, has been started. Their design has been approved by the government. They will cost about 50 cents each. Although considered only the second line of defense, sealed doors and windows being the first, the mask will resist the heaviest concentration of gas for a quarter of an hour and normal gas conditions for four or five hours. Rapid progress is being made in setting up local air raid precautions committees. During the coming year 600 police and fire department officers will be trained as instructors at the new Civilian Gas School near Gloucester.

### Sir Archibald Garrod

Sir Archibald Garrod, the distinguished physician and chemical pathologist, has died at the age of 78 years. The son of a distinguished physician, Sir Alfred Garrod, he was educated at Oxford and St. Bartholomew's Hospital, to which he became physician. In 1890 he published "A Treatise on Rheumatism and Rheumatoid Arthritis," in which the distinction between the two diseases was first laid down. He directed his attention mainly to disease in its chemical aspects. In Batten and Thurstfield's "Diseases of Children by Various Authors" he contributed the articles on "Disease as It Affects Children" and "Diseases of the Ductless Glands and of Metabolism." In 1900 he delivered the Bradshaw lecture at the Royal College of Physicians on "Urinary Pigments in Their Pathological Aspects." The subject of his Croonian lecture was "Inborn Errors of Metabolism," which was published in book form in 1909. Much of his original work on chemical pathology was delivered in lectures on congenital steatorrhea, alkaptonuria, cystinuria and diaminuria and haematomporphyria congenita. He contributed articles on arthritis to Allbutt's "System of Medicine." He was for twenty years one of the editors of the *Quarterly Journal of Medicine*. His last important work, "The Inborn Factors in Disease," was published in 1931. On the death of Osler he became his successor as regius professor of medicine at Oxford. He had the great misfortune of losing his three sons in the war.

### Newer Aspects of Intestinal Infarcts

A case was reported in 1935 by a well known surgeon of Paris, Prof. Raymond Grégoire, in which a preoperative diagnosis of thrombosis of the mesenteric vessels had been made. The patient's condition did not justify an attempt to resect the coil of small intestine, which appeared to be the seat of the thrombosis. To improve the patient's condition, epinephrine was given subcutaneously in the thigh. Almost immediately the exposed intestine began to resume its normal color and luster. The abdomen was closed and the patient recovered. This led to an active discussion at the time Grégoire reported the case as to whether a condition resembling clinically a mesenteric thrombosis could be due to vascular spasm or to some form of anaphylactic shock. At the Nov. 6, 1935, meeting of the Société Nationale de Chirurgie, Grégoire and Couvelaire reported some experiments on visceral infarcts. Quite recently, Dufau added a clinical case of infarct of the small intestine cured by antishock medication. The latter report was made at the Jan. 22, 1936, meeting of the Académie de Chirurgie.

Grégoire and Couvelaire stated that in their opinion a hemorrhagic pancreatitis, intestinal infarct, thrombosis of the testis and uterotubo-ovarian apoplexy have always been regarded as independent lesions. This is probably true of cases in which an obliteration of the nutrient vessels of the viscus existed. But one encounters cases in which no such vascular obstruction can be found, especially in the intestine, in hemorrhagic pancreatitis and in uterotubo-ovarian apoplexy.

Experimentally these various accidents can be caused by a toxemia of the vegetative nervous system, by an endogenous or exogenous poison in the form of an anaphylactic shock. Clinically all the lesions just cited resemble one another by the sudden onset with generalized symptoms, the leading one of which is marked fall in blood pressure. Anatomically, the thirty-two experiments on dogs and guinea-pigs were characterized by a sudden arrest of circulation accompanied by dilatation of the blood vessels and extravasation of blood. This can be temporary or permanent, the circulatory disturbances varying from simple apoplexy to an anemic necrosis. All of Grégoire and Couvelaire's experiments were accomplished by sensitizing the animal with a heterogenous serum (horse). Three weeks later an injection was made at the level of the viscus (pancreas, intestine, uterus or testis) one wished to study. All the experiments were made under local anesthesia.

Following the second injection, the same severe generalized symptoms are observed as are encountered clinically. These are followed by congestion and diffuse hemorrhagic extravasation as in hemorrhagic pancreatitis, intestinal infarct, uterotubo-ovarian apoplexy and testicular thrombosis. The deduction can be made that such lesions, at least in animals, are due to a shock of intolerance or anaphylactic shock. Other investigators were cited as obtaining the same results with other exogenous substances.

As to treatment, if the surgeon observes that the circulation in the viscus, especially of the intestine, reappears after antishock medication, the abdomen can be closed and the same treatment continued. If, however, the viscus presents evidence of incipient necrosis, more radical measures are indicated. If there is a doubt as to the condition of a coil of intestine, it can be exteriorized and resected later. Several successful cases of this kind have been reported recently.

The cases reported by Dufau appear to be a clinical confirmation of the previous observation of Grégoire and of his present experimental work.

A man aged 45 presented the clinical picture of an intestinal infarct. At operation, this condition was found over a length of 80 cm. There was only slight mesenteric infiltration and the arterial pulsation appeared good. Epinephrine was given subcutaneously and also warm serum. The exposed coil regained its normal appearance rapidly and was replaced. An uneventful recovery followed.

### Injuries of the Ureter During Hysterectomy

At the March 11 meeting of the Académie de Chirurgie of Paris, Roger Petit reported twenty cases of kinks, deviation of the course, and stricture as sequelae of hysterectomy. Many of these patients do not consult the surgeon until some time after the intervention, the interval varying from a few months to several years.

In most cases, the chief complaint is pain, both spontaneous and elicited on palpation of the kidney. The pain is usually referred to the lumbar region and often recurs in paroxysmal form with or without a febrile reaction. As a rule pus and bacteria (most commonly *Bacillus coli*) are found in the urine.

During the past four years twenty cases have been encountered. In three cases, the preceding operation had been unilateral salpingectomy for extra-uterine pregnancy, thirteen followed subtotal hysterectomy (three for fibroids and ten for adnexal disease), while four followed complete hysterectomy (two for fibroids and two for adnexal disease).

The methods of diagnosis are by the passage of ureteral catheters or bougies supplemented by ascending ureteropyelography. One should not expect to find very marked changes in the ureter or renal pelvis. At the period in which the pain is first complained of, only a slight degree of dilatation of the ureter or renal pelvis (small hydronephroses), or both, is to be found.

On ureteral exploration with the catheter or bougie, an obstruction is encountered at a level of 4 cm. from the vesical orifice of the ureter. Most commonly this resistance is found at a level of from 8 to 10 cm. Following the passage of the catheter beyond the obstructed area, urine varying in amount from 8 to 30 cc. escapes through the catheter. With the aid of retrograde ureteropyelography, preferably with the use of the Chevassu catheter, an accurate picture of the strictured area, kink or displacement of the pelvic ureter, and dilated portions above, can be obtained. It is unusual for the ureteral disorder to be found at the level of crossing of the ureter by the uterine artery; i. e., 4 cm. up. Most frequently, the level at which the ureteral changes are found is from 8 to 10 cm. up; i. e., at the level of the ovarian pedicle where the ureter is in very close contact with the peritoneum. The ureter can be injured in one or more of three ways: (a) when the ovarian pedicle is ligated too near the pelvic wall, (b) when in covering the hysterectomy stump with peritoneum too much subjacent tissue is included in the suture, and (c) in pulling on the peritoneum too forcibly in the attempt to cover the stump. The peristaltic movements of the ureter are interfered with, resulting in local atony and resultant changes in the ureteral wall and peri-ureteral envelopes. The treatment consists chiefly in dilatation of the strictured area with bougies of gradually increasing caliber followed by lavage of the renal pelvis.

In the discussion, Chevassu stated that he was not convinced, by the films shown by Petit of the presence of an obstruction at the level of the brim of the pelvis, where the ovarian pedicle would be ligated. Quite frequently a fusiform dilatation could be observed in nonoperated women, which began at the point of union of the pelvic and iliac portions of the ureter and extended almost to the kidney. A slight obstruction in the pelvic portion of the ureter sufficed to cause a marked accentuation of such a fusiform dilatation. Gouverneur emphasized the importance of the interference with peristalsis due to too extensive denudation of the ureter during operations.

### Warning Against Vaccination in Infantile Paralysis

At the March 10 meeting of the Académie de Médecine of Paris, Levaditi and his co-workers stated that active immunity in poliomyelitis can be obtained only by the production of an occult infection capable of a vaccination of the nerve centers against the ultravirus. The receptivity of monkeys and especially of human beings to the ultravirus is subject to inexplicable variations, hence the danger of using a living virus whose degree of attenuation cannot be estimated in advance on individuals whose receptivity varies so greatly. Certain persons will be immunized while others are infected.

Experimental study by Levaditi and his co-workers of Kolmer and Rule's vaccine shows that it has a prophylactic action, but this is found in only a very small percentage of animals. The observations published in 1935 by Leake of the United States Public Health Service were cited as showing that the utmost care must be observed in advising vaccination in human beings, because of the imperfect state of the present knowledge of the subject.

April 1, 1936.

### A System of Personal Health-Albums

For some time the public health headquarters of the directorate of the National Socialist Party has been planning to inaugurate a system of personal health-albums, based on physical examinations according to age groups, which eventually would include the entire population of the reich (*THE JOURNAL*, April 13, 1935, p. 1351). By examinations at intervals not to exceed two years, these albums will be kept up to date. A beginning will be made shortly with two age classes from the German Workers Front, an organization which, as every one knows, has taken the place of the trade unions. The German social insurance organization will administer and finance this undertaking. The primary concern will be not so much the singling out of sick persons as the determination of persons considered well. The examination will first attempt to ascertain the functional working capacity and next to make the person's health and working capacity conform to the maximum indicated by hereditary aptitudes. The albums will contain not only a record of defects; positive hereditary factors are also to be stressed as well as data on maximum capability and the means by which it may best be achieved. The headquarters stipulates three classifications of bodily form: slender, muscular and rotund. Persons shall be classed as agile, sluggish, matter of fact, sensitive, hypocritical and so on. Each album contains a family tree in which the hereditary background can be studied. There are three differing types of examinations based on age groups: health blank A for nurslings and children under the age of 6 years; B for the group between the ages of 6 and 18; C from ages 19 to 65. Separate examinations are given for males and females within these groups. The books will remain with the local administrative units of the public health headquarters. When a registrant changes his residence, the album is transferred to the station nearest the new domicile. These records will be placed at the disposal of party and service bureaus only in special circumstances (and under seal of medical professional secrecy). These examinations, in which the racial political bureau of the party will cooperate, are not designed to deprive persons of their employment but to place those suffering from minor disabilities in more suitable occupational fields.

### The Meinicke Test for Tuberculosis

The flocculation test devised by Meinicke some years ago has come to be regarded seriously. Experimentation, however, has not yet been sufficiently extensive. It is important that

the value of this test be demonstrated with clinical material of the general hospital instead of confining its use to tuberculosis stations. Professor Kalk has undertaken such an investigation. The reaction can be established with serum as well as with pleural exudate and even with cadaveric blood. The most important finding is that a single negative result tells nothing; the test must be repeated at regular intervals. Clinically ascertained cases of pulmonary tuberculosis showed 80 per cent positive, or 98 per cent if doubtful cases are included. Control examinations of thirty-five healthy aviators showed only three doubtful cases with positive reactions, the others showing repeated negative reactions. The reactions of the hospital personnel and those of relatives of tuberculous patients were similar. Only 26 per cent showed unequivocal negative reactions. Here, from the nature of the Meinicke test as a true antigen-antibody reaction, the much disputed theory of immunity to tuberculosis by increased exposure suggests itself.

Among hospital patients generally the positive tests indicate mostly an old tuberculous condition with the exception of patients with diabetes, in whom a remarkable accumulation of positive reactions (30 per cent) and doubtful reactions (55 per cent) was observed. Perhaps this should be considered as a manifestation of increased susceptibility to tuberculosis among diabetic patients.

Negative reaction to repeated examinations demonstrates the absence of tuberculosis as reliably as the positive reaction demonstrates the presence of the disease. The doubtful reaction is especially significant if in the course of the illness it changes to a positive. According to Kalk, this test should today belong to the routine of every large hospital.

Of the patients with severe forms of tuberculosis, 36 per cent showed negative reactions to the initial test; but as their condition improved the reaction became positive. This change is regarded as prognostic. On the contrary, fatal cases, for example, often showed negative reactions because of deficiency of antibodies. The weakening of the positive reaction corresponds most particularly to the appearance of exudates. Enfeeblement of a previously strong reaction may be taken to indicate deterioration, convalescence or appearance of exudates. The test is useful only in connection with the clinical course of the disease. The test can be considered as a true antigen-antibody reaction.

As Dr. Meinicke himself emphasizes, thorough roentgen examination is still the choice procedure. For the clinic, however, the Meinicke reaction appears to have taken its place beside the erythrocyte sedimentation reaction and the curve of bodily weight as a useful diagnostic and prognostic aid.

#### Death of Prof. Friedrich Kraus

Prof. Friedrich Kraus, prominent Berlin internist, died March 2, aged 78. Born in the German-Bohemian border region in what is now Czechoslovakia, Kraus studied at Prague, receiving his foundation in biochemistry from Hofmeister and in pathologic anatomy from Hering. In 1889 he became assistant to Kahler at Vienna and as early as 1894 he was called to Graz as an internist to head the university's medical clinic. In 1902 he succeeded Gerhardt in Berlin as the head of the second medical clinic of the university (the Charité).

The painstaking efforts of Kraus to explain constitution and individuality by means of systematic analysis and synthesis were an innovation; his monograph "Fatigue as a Measure of the Constitution" worked a revolution in the world of medical thought. He established the cortical person as opposed to the "tiefen person" (inner person). He contributed to a better understanding of internal medicine in all its ramifications. His vast knowledge permitted him to have unusual slants on many subjects. Many of his attitudes are incomprehensible and perhaps are destined to remain so. His lectures were not easy to

follow; nevertheless doctors came in throngs when it was announced that he would speak. A spell that seemed to emanate from his personality gripped his hearers. His researches on the electrocardiogram were fundamental; his manual "Special Pathology and Therapy of Internal Disorders," written in collaboration with Brugsch, contributed to the profession's practical knowledge in this field. Kraus served for many years as president of the Berlin Medical Society by the acclaim of the membership, who reelected him again and again, although conscious of his foibles. When at the age of 70 he came to make his farewell address, the great auditorium was unable to hold all those who sought admittance, and on that occasion he discoursed in a wholly unintelligible vein. It may be that his prodigious mind placed him in advance of his time. Kraus knew how to stimulate thought. His manner while lecturing was always unassuming, although he frequently was so overwhelmed by the profundity of his ideas that he would digress from the announced topic of his discourse.

#### Graduate Teaching in Rumania

Graduate medical teaching is primarily national in Rumania and it has not been organized as yet by the state. To meet the requirements of country doctors, the ministry of public health in conjunction with the ministry of public instruction resolved to arrange courses in Jassy, Galatz, Craiova, Cluj, Brasov, Oradea and Bucharest. Doctors who cannot afford to take the courses and cannot get the funds will be provided with free board in the Physicians House in Bucharest, and others will get board at a much reduced rate. The central committee also makes daily allowances in certain cases. For those holding official positions the committee is endeavoring to get leave for the duration of the courses, which are to be entirely free except for the registration fee of \$1.50. The courses last respectively two weeks and a month. Some of the Bucharest clinics give tuition to graduates during the whole of the academic year. The courses to be held this year will be in maternal and child welfare and in first aid to injured persons. A special feature will be courses in the economical management of public health institutions, for medical superintendents. The subjects dealt with will include hospital construction, equipment and management, medical technic, institutional feeding and laundry work.

#### Physicians in Public Service

The new law reorganizing public medical service distinguishes five groups of physicians, according to whether they are concerned with public hygiene, healing, laboratory work, administration in cities and parishes, or forensic medicine. Specialists in any branch of medicine must produce evidence of having studied their branch for at least four years after graduation. The law recognizes as specialists those who, before its proclamation, were university professors, lecturers, assistants or senior hospital physicians, or worked as secondary doctors in a special section of a recognized hospital. Private physicians will be recognized as specialists only if they can supply documentary evidence of having worked in their specialty for at least four years.

In the public service the following ranks are established: junior physician, titular physician, physician-in-chief, principal physician, inspector-general physician and consulting physician. As a rule, every one must begin his public career as a junior physician and must spend two years in this capacity. Advancement is not a certainty but takes place according to merit. One must, however, spend at least two years as junior and

four years as titular physician. The rank of inspector-general is reserved for the most prominent doctors and appointment is subject to the recommendation of a special commission. Their total number cannot exceed twenty-four in the whole country. If an inspector-general has shown a particularly useful and conscientious activity he receives on retirement the title of medic consilier sanitar. The old law recognized four grades, each promotion providing a 15 per cent rise in salary. The new law is more liberal and provides five grades, each with 25 per cent rise, and the total increase of 125 per cent, together with several additional sources of income, ensures a comfortable living. At the age of 60 every physician may be pensioned at the suggestion of the commission. At 62 all must retire without regard to years of service.

### Sued for Professional Indiscretion

At a thermal bathing resort near Oradea, an industrial town, a venereal specialist was sitting in a common bath, when he saw that a patient of his, who on the day before consulted him for the treatment of scabies, wanted to enter. The doctor stepped out of the water and advised the patient to go to a private bath. In his present state the patient was a menace to all who were in the water. The patient refused to do so, and the doctor threatened to call the bath servant to remove him. The patient was obdurate and the doctor called the bath servant and told him to eject the obstinate person, who later brought legal action against the doctor for professional indiscretion, arguing that when he wanted to enter into the common bath he was cured of his scabies. The doctor stated that he did not make known at the time the cause for the removal of the man. He was the official doctor of the bath, and it was impossible that he would have had been totally cured of his scabies for which he consulted him only one day before. The doctor was acquitted and the man in question was fined 1,000 lei for attempting to enter a common bath with a contagious disease.

### The Death of Professor Pavlov

The medical world mourns the death of the physiologist Ivan Petrovitch Pavlov, February 27, of influenza, with which he was ill only a few days. Professor Pavlov was born at Ryazan, Sept. 27, 1849, the son of a priest. After his early education in a seminary he attended in 1870 the faculty of natural sciences at St. Petersburg and began his study of physiology. In 1874 he published his first work, on innervation of the pancreas, which was awarded a gold medal. After graduating at the university he entered the third course of the Military Medical Academy, simultaneously working as assistant to Professor Zion. In 1877, under Professor Heidenhain, he studied the physiology of the gastro-intestinal tract. After graduating from the academy in 1879 he received the M.D. degree for his work on centripetal heart nerves. He worked five years in Germany with Ludwig and Heidenhain (1884-1886) and published several papers, on the pancreatic juice, salivation in sham feeding and other subjects. He was elected in 1890 professor of the Tomsk (Siberia) University but the appointment was not confirmed by the government. In the same year he was given the chair of pharmacology in the University of Warsaw and in the Military Medical Academy in St. Petersburg; the latter he occupied till 1924. In 1897 Professor Pavlov summarized the result of his works in the monograph "Lectures on the Digestive Glands." He was awarded for these researches the Nobel prize in 1904. In 1906 he was elected a member of the Russian Academy of Science. In 1903 at the meeting of the International Congress of

Physiologists in Madrid he read his paper on experimental psychology of animals, which became the basis of a new chapter in physiology. In his two books "Twenty Years' Experience in Experimental Study of the Nervous Reactions of Animals" and "Lectures on the Work of the Cerebral Hemispheres" he gave a complete systematic statement of the theory of conditioned reflexes. The soviet government helped in his work. His laboratories in Coltuschi were erected along Pavlov's own ideas. Till his last days he was head of the Institute of Physiology and Pathology of Higher Nervous Activity, the Department of Physiology of the All-Union Institute of Experimental Medicine and the biologic station at Coltuschi.

In 1935 Pavlov was chosen president of the fifteenth International Congress of Physiologists; in the autumn of 1935 he read a paper at the international meeting of neurologists in London. In one of the central squares of Leningrad there will be erected his monument. The First Leningrad Medical Institute received Pavlov's name. The Academy of Science of the Union of Socialist Soviet Republics will publish all his works in Russian, French, English and German. The brain of the celebrated scientist is conserved in the Moscow Brain Institute, where it will be thoroughly studied. Pavlov's laboratory at Leningrad will be left as a museum. His wife receives a pension of 1,000 rubles a month. The funeral of Pavlov, at government expense, was a true demonstration of the peoples' sorrow. Thousands were present. His family received telegrams and letters from all over the world and from all leaders in our country.

### The Endocrinology Institute

The State Institute of Experimental Endocrinology was established at Moscow about ten years ago and is working now under the leadership of Prof. Nicholas A. Shereshevskiy. It studies theoretical and clinical problems. The institute has departments of biomorphology, biochemistry and physiology, a clinic for endocrine disorders and a department which standardizes all glandular preparations manufactured here. Without its sanction no endocrine preparation can be used in the Soviet Union. The chief subjects now being studied are at present obesity, cachexia, premature sexual development and exophthalmic goiter. In the clinic are studied the newest methods of treatment of glandular diseases. The institute publishes the monthly journal *Problems of Endocrinology*. This institute is the center for the study of endocrinology in this country. A special new building will be erected for the institute within the next few years.

### Prizes for Best Works on Rheumatism

The international committee awarding prizes for the best works on rheumatism had its meeting at Moscow, Dec. 16, 1935. Professor Intvar of Lund, Sweden, Professor van Breemen of the Netherlands, Prof. Maximilian P. Conchalovsky and Prof. G. M. Danichevsky of Moscow were present. Forty-two scientific works, were reviewed. The prize of \$10,000 was divided in equal parts among Professor Calniere of Stockholm, P. Wayle of Paris, Schlesinger of London and Freinhd of Vienna.

### The Death of Prof. S. P. Fedorov

Prof. Serge Petrovitch Fedorov, one of the leading surgeons, has died in Leningrad from cancer of the rectum. When 26 years of age he received the doctor of medicine degree; at 34 he was chosen professor of surgery in the Leningrad Military Medical Academy, which position he held for nearly forty years. His principal studies were on surgery of the bile tract and gastro-enterology. Professor Fedorov was a brilliant operator and the author of about 120 scientific works. He was the president of the Leningrad surgical society.

## Marriages

WILLIAM LENEAVE BERKLEY, lieutenant (j. g.) M. C., U. S. Navy, to Miss Charlotte Hamilton Priest, in Washington, D. C., April 11.

LYNN JAMES LULL to Miss Gladys M. Sullivan, both of Olathe, Colo., at Grand Junction, Colo., April 1.

WILLIAM C. HUTCHISON to Miss Elizabeth Agnes Wargo, both of McKeesport, Pa., May 9.

ANTHONY E. REYMONT to Miss Elizabeth Elich, both of Chicago, April 25.

ABRAHAM COHEN to Miss Lillian Davidow, both of Reading, Pa., May 10.

## Deaths

Roger Griswold Perkins ☉ Wakefield, R. I.; Johns Hopkins University School of Medicine, Baltimore, 1898; member of the Ohio State Medical Association; professor emeritus, hygiene and preventive medicine, Western Reserve University School of Medicine, Cleveland, lecturer on bacteriology, 1901-1904, assistant professor of pathology and bacteriology, 1904-1908, associate professor of pathology and hygiene, 1908-1911, and professor of hygiene and preventive medicine, 1911-1930; city bacteriologist in Cleveland, 1906-1907, 1913-1914; chief of the bureau of laboratories of the city division of health, 1914-1923; consultant to the commissioner of health and director of the laboratories, 1923-1930; chairman of the Cleveland Health Council, 1925-1929; trustee of the Brush Foundation, Cleveland; member of the American Red Cross Commission to Rumania, 1917-1918; medical associate to the scientific attaché of the American Embassy in Paris in 1918; director of the sanitation division of the American Red Cross Commission to the Balkan States in 1919; aged 61; died, March 28, in the Rhode Island Hospital, Providence, of pulmonary embolus, following transurethral resection of the prostate.

Rufus Bartlett Hall, Cincinnati; Miami Medical College, Cincinnati, 1872; professor emeritus of gynecology, University of Cincinnati College of Medicine; member of the Southern Surgical Association; past president of the American Association of Obstetricians, Gynecologists and Abdominal Surgeons, Ohio State Medical Association and the Cincinnati Academy of Medicine; member of the House of Delegates of the American Medical Association from 1908 to 1909 and in 1919; fellow of the American College of Surgeons; formerly on the staff of the Cincinnati General Hospital; one of the organizers of the Presbyterian Hospital; aged 86; died, April 3.

Camille Alphonse H. Fortier ☉ Milwaukee; Milwaukee Medical College, 1911; formerly lecturer on radiology, Marquette Dental College and Marquette University School of Medicine; served during the World War; at various times on the staffs of the Johnston Emergency Hospital, Milwaukee County Hospital, Evangelical Deaconess Hospital, Maternity and General Hospital, St. Luke's Hospital and St. Joseph's Hospital, Milwaukee, St. Mary's Hospital and St. Luke's Hospital, Racine, and roentgenologist to the Memorial Hospital, Burlington, Wis.; aged 59; died, March 7, of cerebral hemorrhage.

Evan Thomas Steadman ☉ Montclair, N. J.; University of the City of New York Medical Department, 1885; past president of the Hudson County Medical Society; fellow of the American College of Surgeons; on the staffs of St. Mary's Hospital, Hoboken, Christ Hospital and Margaret Hague Hospital, Jersey City, and the North Hudson Hospital, Weehawken; consultant physician to the Mountainside Hospital; aged 74; died, March 28, of arteriosclerosis.

John King Adams ☉ East Orange, N. J.; Columbia University College of Physicians and Surgeons, New York, 1902; fellow of the American College of Surgeons; served during the World War; attending surgeon to the Hospital and Home for Crippled Children, Newark; attending orthopedist to St. Mary's Hospital, Orange, and the Dover (N. J.) General Hospital; aged 58; died, March 27, in the Mountainside Hospital, Montclair, of aortic insufficiency.

Charles Edward Vail, Miraj, India; Columbia University College of Physicians and Surgeons, New York, 1906; fellow of the American College of Surgeons; for twenty-six years a medical missionary; professor of surgery and obstetrics, Miraj Medical School; physician in charge of the American Presbyterian Mission Hospital; aged 56; died, March 21, of abdominal carcinoma.

John Abner Snell, Soochow, China; Vanderbilt University School of Medicine, Nashville, Tenn., 1908; fellow of the American College of Surgeons; for many years a medical missionary; superintendent of the Soochow Hospital; member of the Council on Hospitals of the China Medical Association; aged 55; died, March 2, of pneumonia, following influenza.

Charles Williams Crane ☉ Augusta, Ga.; University of Georgia Medical Department, Augusta, 1898; professor of clinical surgery at his alma mater; fellow of the American College of Surgeons; formerly medical director and chief surgeon of the Margaret Wright Hospital; attending surgeon to the Wilberford and University hospitals; aged 61; died, April 1.

Emery Austin Miller, Brooklyn; Eclectic Medical College of the City of New York, 1891; College of Physicians and Surgeons, Baltimore, 1894; College of Physicians and Surgeons, Medical Department of Columbia College, New York, 1895; aged 68; died, February 8, in the Kings County Hospital, of arteriosclerotic heart disease and diabetes mellitus.

Charles Arthur Baragar, Edmonton, Alta., Canada; Manitoba Medical College, Winnipeg, 1914; member of the American Psychiatric Association; clinical professor of psychiatry, University of Alberta Faculty of Medicine; commissioner of mental institutions and director of mental health, department of public health; aged 50; died, March 8, of pneumonia.

Willis Hanford Crowe ☉ New Haven, Conn.; College of Physicians and Surgeons, Medical Department of Columbia College, New York, 1895; fellow of the American College of Surgeons; attending surgeon to the Hospital of St. Raphael and consulting surgeon to the Grace Hospital; aged 62; died, March 24, of coronary occlusion and chronic nephritis.

Herbert Daniel Kistler ☉ Butte, Mont.; St. Louis University School of Medicine, 1905; past secretary of the Montana State Medical Association; fellow of the American College of Surgeons; president of the Murray Hospital and Murray Hospital Clinic; aged 59; died, March 29, in Lovelock, Nev., of injuries received in an automobile accident.

Frank Doig Francis ☉ Major, U. S. Army, retired, Tampa, Fla.; Northwestern University Medical School, Chicago, 1903; served during the World War; entered the medical corps of the regular army as a major in 1920 and retired in 1932 for disability in line of duty; aged 57; died, April 5, of cerebral hemorrhage, arteriosclerosis and nephritis.

George Edward Webb Hardy Jr. ☉ Tampa, Fla.; Johns Hopkins University School of Medicine, Baltimore, 1917; served during the World War; fellow of the American College of Surgeons; member of the surgical staffs of the Tampa Municipal Hospital and St. Joseph's Hospital; aged 43; died, March 26, of cerebral and coronary thrombosis.

Joseph L. McDermott ☉ Kansas City, Mo.; University of Kansas School of Medicine, Kansas City, 1907; clinical professor of radiology at his alma mater; member of the Radiological Society of North America; aged 60; past president and on the staff of St. Joseph Hospital, where he died, March 6, of a hemolytic streptococcus infection.

William Harry Bergtold, Denver; University of Buffalo School of Medicine, 1887; member of the American Climatological Association; professor of pathology at the University of Denver, 1897-1900; served during the World War; since 1900 member of the staff of St. Joseph's Hospital; aged 70; died, March 19.

George Edward Clark, Providence, R. I.; University of Maryland School of Medicine, Baltimore, 1889; member of the American Psychiatric Association and the New England Society of Psychiatry; aged 72; on the staff of the Butler Hospital, where he died, March 14, of cerebral thrombosis and pulmonary tuberculosis.

Paul Christopher Geissler, Tulsa, Okla.; University of Nebraska College of Medicine, Omaha, 1916; member of the Associated Anesthetists of the United States and Canada; served during the World War; aged 46; on the staffs of St. John's Hospital and the Morningside Hospital, where he died, March 16.

Frank Sherwood Meade ☉ Madison, Wis.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1908; member of the Radiological Society of North America; aged 53; died, March 1, in the Madison General Hospital, of arteriosclerosis and chronic nephritis.

Frederick Danforth McAllister ☉ Lawrence, Mass.; Harvard University Medical School, Boston, 1898; fellow of the American College of Surgeons; aged 63; visiting surgeon to the Lawrence General Hospital, where he died, March 17, following an operation for acute gangrenous cholecystitis.

**Henry Edwin Morrison**, San Jose, Calif.; Cooper Medical College, San Francisco, 1897; member of the Associated Anesthetists of the United States and Canada; served during the World War; at one time superintendent of the Sacramento (Calif.) Hospital; aged 66; died, March 24.

**Harry Otis Johnson**, Machias, Maine; University of Maryland School of Medicine, Baltimore, 1903; member of the Maine Medical Association; county medical examiner; at various times a member of the school board; aged 61; died suddenly, February 18, of coronary occlusion.

**Edward R. Kellogg**, Los Angeles; New York Homeopathic Medical College and Hospital, 1891; fellow of the American College of Surgeons; on the staff of the Hollywood Clara Barton Memorial Hospital; aged 67; died suddenly, April 9, of cerebral hemorrhage.

**Alano Eleno Pierce** Ⓢ Minot, N. D.; University of Minnesota Medical School, Minneapolis, 1925; fellow of the American College of Physicians; associated with the Northwest Clinic; on the staff of the Trinity Hospital; aged 35; died, March 14, of pneumonia.

**Tilghman Brice Marden**, Preston, Md.; University of Maryland School of Medicine, Baltimore, 1892; formerly professor of histology and embryology at his alma mater; aged 66; died, March 17, in the Emergency Hospital, Easton, of diabetes mellitus.

**Graham Chambers**, Toronto, Ont., Canada; University of Toronto Faculty of Medicine, 1889; Trinity Medical College, Toronto, 1892; formerly associate professor of clinical medicine at the University of Toronto Faculty of Medicine; died, March 27.

**Russell Eugene Miller**, Akron, Ind.; Indiana University School of Medicine, Indianapolis, 1930; member of the Indiana State Medical Association; aged 28; died, February 3, in the Woodlawn Hospital, Rochester, of cellulitis of the face and neck.

**Peter Murray** Ⓢ New York; College of Physicians and Surgeons, Medical Department of Columbia College, New York, 1884; fellow of the American College of Physicians; consulting physician to St. Vincent's Hospital; aged 74; died, March 6.

**Alpha Raymond Morse** Ⓢ Oxford, N. Y.; Baltimore Medical College, 1904; past president of the Chenango County Medical Society; county coroner; formerly mayor; aged 64; died, February 16, of chronic nephritis and coronary disease.

**Roy Edgar Barrows** Ⓢ Cairo, Ill.; Northwestern University Medical School, Chicago, 1909; acting assistant surgeon of the U. S. Public Health Service; on the staff of St. Mary's Hospital; aged 51; died suddenly, March 20, of angina pectoris.

**John William McLean**, North Sydney, N. S., Canada; McGill University Faculty of Medicine, Montreal, Que., 1883; fellow of the American College of Surgeons; surgeon to the Hamilton Memorial Hospital; aged 79; died, March 28.

**Edwin Eugene Whiteside**, Portland, Ore.; Barnes Medical College, St. Louis, 1907; served during the World War; aged 64; died, March 2, in the Veterans Administration Facility, American Lake, Wash., of bronchopneumonia.

**John Richard Morgan**, Twin Falls, Idaho; Northwestern University Medical School, Chicago, 1907; member of the Idaho State Medical Association; served during the World War; aged 62; died, February 20, of coronary occlusion.

**John Alexander McLeay**, New York; L. A. H., Dublin, Ireland, 1887; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1892; aged 73; died, February 12, at the Columbia-Presbyterian Medical Center.

**John Vincent Kerrigan** Ⓢ Michigan City, Ind.; Northwestern University Medical School, Chicago, 1908; served during the World War; on the staff of St. Vincent's Hospital; aged 50; died, February 10, of pneumonia.

**John Hammond Anderson**, Cranston, R. I.; Tufts College Medical School, Boston, 1904; member of the New England Society of Psychiatry; aged 54; died, February 22, at his home in Auburn, of coronary thrombosis.

**Jerome Bonaparte Rogers**, Pottsville, Pa.; Jefferson Medical College of Philadelphia, 1904; at one time county medical director; formerly medical superintendent of the Pottsville Hospital; aged 59; died, March 2.

**William H. Dings**, Mitchell, Ind.; Louisville (Ky.) Medical College, 1894; member of the Indiana State Medical Association; aged 62; died, February 17, in the Dunn Memorial Hospital, Bedford, of pneumonia.

**David Paul Caldwell**, Sidel, Ill.; Hahnemann Medical College and Hospital, Chicago, 1916; member of the Illinois State

Medical Society; for many years member of the school board; aged 42; died, February 2.

**Elijah George Harris**, Chicago; Bennett Medical College, Chicago, 1915; member of the Illinois State Medical Society; aged 68; died, February 15, of peritonitis and impacted stone in the common bile duct.

**Guy Godley Kilgour** Ⓢ Chicago; Jenner Medical College, Chicago, 1903; aged 63; on the staff of the Chicago State Hospital, where he died, March 31, of peritonitis following perforated duodenal ulcer.

**Eugene McKay Bailey** Ⓢ Acworth, Ga.; Atlanta Medical College, 1890; past president of the Cobb County Medical Society; aged 67; died, March 2, in a hospital at Atlanta, of coronary thrombosis.

**William Joseph Durkin**, Brooklyn; University of Maryland School of Medicine, Baltimore, 1911; aged 53; died, March 3, in the Kings County Hospital, of cerebral hemorrhage and hypertension.

**Julian Terrell Coggeshall**, Darlington, S. C.; University of Louisville (Ky.) Medical Department, 1907; member of the South Carolina Medical Association; aged 60; died, March 1, of pneumonia.

**Carl Frederick B. Fuchs**, Brooklyn; University of the City of New York Medical Department, 1890; aged 74; died, March 11, in the Kings County Hospital, of arteriosclerosis and thrombosis.

**Robert H. Craig** Ⓢ Charleston, Ill.; Louisville (Ky.) Medical College, 1900; formerly secretary of the Coles-Cumberland County Medical Society; aged 62; died, February 20, of septicemia.

**James Albert Anderson**, Gastonia, N. C.; University of Georgia Medical Department, Augusta, 1899; served during the World War; aged 59; died, March 13, of nephritis and myocarditis.

**Louis Putnam Earnshaw**, Cincinnati; Miami Medical College, Cincinnati, 1895; aged 64; died, March 23, in the Hamilton County Home and Chronic Disease Hospital, of chronic myocarditis.

**James M. King**, Metcalf, Ga.; Chattanooga (Tenn.) Medical College, 1894; aged 77; died, February 7, in the Archbold Memorial Hospital, Thomasville, of pyelonephrosis and uremia.

**A. C. Heidman**, Columbia, Mo.; St. Louis College of Physicians and Surgeons, 1883; aged 74; died, March 3, in the Parker Memorial Hospital, of influenza and pulmonary edema.

**Dagobert A. Scheibenzuber**, Hyde Park, Ohio; Cincinnati College of Medicine and Surgery, 1891; aged 67; was found dead in his automobile, February 25, of cerebral hemorrhage.

**Walter Lee Beauchamp**, Williamson, Ga.; Atlanta College of Physicians and Surgeons, 1908; aged 52; died, February 29, in the Strickland Memorial Hospital, Griffin, of erysipelas.

**Francis M. Ward**, Washington, D. C.; Georgetown University School of Medicine, Washington, 1881; aged 78; died, January 24, in the Garfield Hospital, of cerebral hemorrhage.

**Fred H. Davis**, Lyndonville, Vt.; Hahnemann Medical College and Hospital, Chicago, 1890; member of the Vermont State Medical Society; aged 78; died, February 22, of erysipelas.

**John Joseph Garry**, Worcester, Mass. (licensed in Massachusetts in 1914); for many years on the staff of St. Vincent Hospital; aged 55; died, March 25, of coronary occlusion.

**William Henry Ellis**, Gladstone, Mich.; Rush Medical College, Chicago, 1880; aged 80; died, February 24, in St. Francis Hospital, Escanaba, of fracture of the right hip.

**Frederick August Karst** Ⓢ Chicago; Hahnemann Medical College and Hospital, Chicago, 1887; aged 82; died, February 27, of chronic myocarditis, at his home in Wilmette, Ill.

**William Louis Abbott**, Elk Neck, Md.; University of Pennsylvania Department of Medicine, Philadelphia, 1884; aged 76; died, April 2, of myocarditis and lobar pneumonia.

**William H. Hughes**, Greensboro, N. C.; Meharry Medical College, Nashville, Tenn., 1888; aged 73; died, February 17, of basal fracture of skull due to a fall down the stairs.

**Harry Andrews Collings** Ⓢ Susanville, Calif.; College of Physicians and Surgeons of San Francisco, 1911; aged 55; died, March 8, at St. Helena, of chronic cholecystitis.

**Edgar James Torey**, Delmar, N. Y.; University of the City of New York Medical Department, 1890; aged 77; died, February 3, of carcinoma of the tongue and anemia.

**Anna Laura Taylor**, Elkins, W. Va.; Laura Memorial Woman's Medical College, Cincinnati, 1898; aged 70; died, March 9, in a hospital at Weston, of gangrene.

**Clarence Follett Smith**, Ransomville, N. Y.; University of the City of New York Medical Department, 1880; aged 79; died, February 4, of cerebral hemorrhage and senility.

**Thomas Macer**, Evansville, Ind.; Eclectic Medical Institute, Cincinnati, 1884; aged 75; died, February 1, of cardiac decompensation, arteriosclerosis, hypertension and nephritis.

**Ortive E. Latham**, Ann Arbor, Mich.; Hahnemann Medical College and Hospital, Chicago, 1882; aged 83; died, February 22, of heart disease and carcinoma of the prostate.

**Alton Sanford**, Weston, W. Va.; Tulane University of Louisiana School of Medicine, New Orleans, 1929; aged 31; died, February 18, in Ryland, Ala., of pneumonia.

**James R. Labadie**, Fraser, Mich.; Michigan College of Medicine and Surgery, Detroit, 1897; aged 61; died, March 20, in the Ford Hospital, Detroit, of diabetes mellitus.

**William A. Powers**, Pacific, Mo.; Beaumont Hospital Medical College, St. Louis, 1898; aged 59; died, March 11, in St. John's Hospital, St. Louis, of Hodgkin's disease.

**John Ralph Mabee**, Chicago; University of Louisville (Ky.) Medical Department, 1895; aged 63; died, February 12, in the Alexian Brothers' Hospital, of diabetes mellitus.

**James Thomas A. Wright**, Salisbury, N. C.; College of Physicians and Surgeons, Baltimore, 1892; aged 63; died, March 10, in Punxsutawney, Pa., of pneumonia.

**Justin Starr Barker**, Kennebunk, Maine; Howard University College of Medicine, Washington, D. C., 1889; aged 69; died, February 17, of coronary thrombosis.

**Eugenie Ferguson Boies**, Buda, Ill.; Jenner Medical College, Chicago, 1909; aged 63; died, February 12, in the Perry Memorial Hospital, Princeton, of pneumonia.

**Colbert Smith Davis**, Rock Island, Ill.; Northwestern University Medical School, Chicago, 1909; aged 54; died, February 9, in St. Anthony's Hospital, of pneumonia.

**Clark E. Ernest**, Gasport, N. Y.; University of Buffalo School of Medicine, 1888; aged 77; died, March 12, in the City Hospital, Lockport, of cerebral hemorrhage.

**Albert Corryden McGee**, McNabb, Ill.; Eclectic Medical Institute, Cincinnati, 1881; aged 80; died, February 20, in St. Mary's Hospital, La Salle, of myocarditis.

**David Lewis Holland**, Chicago; Loyola University School of Medicine, Chicago, 1917; aged 55; died, February 18, of coronary thrombosis and chronic nephritis.

**Thomas H. D. Stuart**, Dallas, Texas; Philadelphia University of Medicine and Surgery, 1867; Confederate veteran; aged 96; died, February 22, of nephritis.

**Norman Bond Kerr**, Plainfield, N. J.; University of Pennsylvania Department of Medicine, Philadelphia, 1882; aged 76; died, March 27, of cerebral hemorrhage.

**George E. Wire**, Worcester, Mass.; Chicago Medical College, 1883; aged 77; was found dead in bed, February 23, of arteriosclerosis and coronary sclerosis.

**James E. Clark**, Detroit; Detroit College of Medicine, 1912; member of the Michigan State Medical Society; aged 56; died, March 12, in the Providence Hospital.

**Mary Freeman** ♂ Perrine, Fla.; Medical College of the State of South Carolina, Charleston, 1912; aged 67; was killed, February 2, in an automobile accident.

**Frederick Wanton Van Valkenburg**, Long Prairie, Minn.; University of Minnesota Medical School, Minneapolis, 1925; aged 37; died, February 4, in Anoka.

**George Frank Day**, Washington, D. C.; Pulte Medical College, Cincinnati, 1883; aged 78; died, February 17, in the Homeopathic Hospital, of pneumonia.

**Franklin John Kaufmann** ♂ Syracuse, N. Y.; Harvard University Medical School, Boston, 1887; aged 72; died, February 6, of carcinoma of the rectum.

**Charles M. Heberton**, Denver; Medico-Chirurgical College of Philadelphia, 1897; aged 65; died, February 8, in St. Anthony's Hospital, of pneumonia.

**Harry Edgar Hall**, Chattanooga, Tenn.; Southern College of Medicine and Surgery, Atlanta, 1913; aged 44; died, February 21, of cerebral hemorrhage.

**Edwin Sturtevant Steese** ♂ New York; Harvard University Medical School, Boston, 1893; aged 66; died, February 7, in the Roosevelt Hospital.

**Carrol Clinton Carpenter**, Minneapolis; University of Minnesota Medical School, Minneapolis, 1897; aged 63; died, February 9, of heart disease.

**Frank M. Archibald** ♂ Mahanomen, Minn.; College of Physicians and Surgeons of Chicago, 1893; aged 70; died, March 1, of cerebral hemorrhage.

**William Bonnar**, Chicago; Faculty of Medicine of Trinity College, Toronto, Ont., Canada, 1882; aged 79; died, February 29, of chronic myocarditis.

**Michael Joseph Ford**, Omaha; John A. Creighton Medical College, Omaha, 1901; aged 64; died, February 18, of coronary thrombosis and myocarditis.

**Condy C. Gallagher**, Manayunk, Pa.; Atlanta College of Physicians and Surgeons, 1900; also a dentist; aged 73; died, March 13, of myocarditis.

**John B. Curtis**, Orange Heights, Fla.; Medical School of Maine, Portland, 1879; aged 81; died, March 4, of bronchopneumonia and peritonitis.

**James Frank Leslie**, Marshfield, Ore.; Northwestern University Medical School, Chicago, 1903; aged 56; died, February 4, of pneumonia.

**Malcolm Wayland Everson**, Pittsburgh; Jefferson Medical College of Philadelphia, 1889; aged 68; died suddenly, February 6, in New York.

**Samuel P. Miller**, Columbia, Ky.; University of Louisville Medical Department, 1888; formerly county health officer; aged 71; died, February 26.

**Mary Emma Bliss Robinson**, Duxbury, Mass.; Boston University School of Medicine, 1897; aged 79; died, February 26, of lobar pneumonia.

**Charles Kelley**, Franklinville, N. Y.; University of Buffalo School of Medicine, 1899; aged 66; died, February 29, of scurvy and secondary anemia.

**Harry Cleveland Harris**, Brooklyn; Jefferson Medical College of Philadelphia, 1908; aged 50; died, February 19, of cerebral hemorrhage.

**William Lloyd Hughes**, East Chicago, Ind.; Barnes Medical College, St. Louis, 1899; aged 63; died, February 18, of coronary thrombosis.

**Harry S. P. Lare**, St. Louis; Missouri Medical College, St. Louis, 1881; aged 74; was found dead in bed, March 8, of cerebral hemorrhage.

**Edwin B. Olmstead**, Cleveland Heights, Ohio; Georgetown University School of Medicine, Washington, D. C., 1887; aged 74; died in March.

**Howard Stanley Allen** ♂ Delta, Pa.; University of Maryland School of Medicine, Baltimore, 1931; aged 28; died, March 7, of scarlet fever.

**John M. Fisher**, Hagerstown, Ind. (licensed in Indiana in 1897); aged 90; died, February 22, of chronic nephritis and arteriosclerosis.

**Isaac L. McGinness**, Pikeville, Tenn.; Chattanooga Medical College, 1899; aged 64; died, February 27, of a self-inflicted bullet wound.

**George Whipple Hubbard**, Houston, Texas (registered by Texas State Board of Medical Examiners); aged 62; died, February 8.

**Thomas Moore Hoskins**, Oklahoma City, Okla.; University of Nashville (Tenn.) Medical Department, 1892; died, February 8.

**Perry M. Brown**, Wheeling, W. Va.; Meharry Medical College, Nashville, Tenn., 1922; aged 37; died, February 25, of pneumonia.

**George Wynn Shirk**, New York; Rush Medical College, Chicago, 1897; aged 63; died, February 16, of cerebral hemorrhage.

**Carl Boright Dunn**, Madison, Ind.; University of Vermont College of Medicine, Burlington, 1900; aged 64; died in February.

**George Aubry Henry**, Horatio, Ark. (licensed in Arkansas in 1903); aged 69; died, February 19, in a hospital at Texarkana.

**Greene B. Jackson**, Fairland, Okla. (licensed in Arkansas in 1903); aged 72; died, March 25, of carcinoma of the stomach.

**Samuel Donaldson Petros**, Tenn.; Chattanooga Medical College, 1901; aged 59; died, March 2, of cerebral hemorrhage.

**Daniel George Lawton**, Detroit; Saginaw Valley Medical College, 1901; aged 57; died, February 9, of multiple sclerosis.

**Samuel John Randall**, Denver; Pulte Medical College, Cincinnati, 1880; aged 83; died, February 19.

**R. C. Arbaugh**, Booneville, Ark. (licensed in Arkansas in 1903); aged 64; died, February 29.

## Bureau of Investigation

### MISBRANDED "PATENT MEDICINES"

#### Abstracts of Notices of Judgment Issued by the Food and Drug Administration of the United States Department of Agriculture

[EDITORIAL NOTE: The abstracts that follow are given in the briefest possible form: (1) the name of the product; (2) the name of the manufacturer, shipper or consigner; (3) the composition; (4) the type of nostrum; (5) the reason for the charge of misbranding and (6) the date of issuance of the Notice of Judgment—which may be considerably later than the date of the seizure of the product.]

**666 Salve.**—Monticello Drug Co., New York, New Orleans, Jacksonville, Fla., and Mexico City. Composition. Essentially volatile oils including camphor, menthol, eucalyptus and a coniferous oil such as cedar leaf oil, in petrolatum. For catarrh, chills, streptococcal infections, etc. Fraudulent therapeutic claims—[N. J. 23264, May, 1935.]

**Herb Tea No. 10.**—Arko Herbs, Inc. Composition. Essentially ground senna pods, with small amounts of sassafras bark and fennel seed, and minute amounts of senna leaf and bearberry. Cure-all. Fraudulent therapeutic claims—[N. J. 23272, May, 1935.]

**Arko Healing Salve.**—Arko Herbs, Inc. Composition. Essentially boric acid (4 per cent), zinc oxide (4.6 per cent), and a compound of aluminum, carbolic acid and water, in petrolatum. Fraudulent therapeutic claims—[N. J. 23272, May, 1935.]

**Holbrook's Ka-Kola.**—Holbrook Kola Co., Boston. Composition. Essentially acetanilid (4.68 grains), caffeine (10 grain), baking soda (1.9 grains) and crude drugs including celery seed, cinnamon and red pepper. For headache, grippe, female complaints, asthma, malaria, etc. Fraudulent therapeutic claims—[N. J. 23274, May, 1935.]

**Prestolas.**—Union Capsule Co., Bloomfield, N. J. Composition. Capsules consisting essentially of volatile oils including pennyroyal and savin (42 per cent), and a fixed oil. For female disorders. Fraudulent therapeutic claims—[N. J. 23276, May, 1935.]

**Epsotabs.**—Dill Co., Norristown, Pa. Composition. In each tablet 1½ grains phenolphthalein and about 4½ grains of epsom salt; one specimen also contained aloin. Misbranded because the name "Epsotabs, The Laxative" on the label falsely represented that the stuff was entirely epsom salt, whereas, its chief laxative action was due to phenolphthalein and, in one specimen, to phenolphthalein and aloin—[N. J. 23277, May, 1935.]

**Re-Ju-Va.**—Re Ju-Va Co., Columbus, Ohio, and Minneapolis. Composition. A red watery solution with a peppermint odor, consisting essentially of epsom salt, iron chloride, and a small amount of citric acid, with glycerin and mineral hypophosphites. Cure-all. Fraudulent therapeutic claims—[N. J. 23279, May, 1935.]

**Rawleigh's Tonic Compound.**—W. T. Rawleigh Co., Freeport, Ill. Composition. Essentially small amounts of sodium, potassium, calcium, iron, manganese, quinine and strychnine salts, hypophosphites, citrates, alcohol, sugar and water. For underweight, general debility, nervous disorders, etc. Fraudulent therapeutic claims—[N. J. 23280, May, 1935.]

**Rawleigh's Thyme Cough Compound.**—W. T. Rawleigh Co., Freeport, Ill. Composition. Essentially extract of thyme, with alcohol, sugar and water. For coughs, bronchitis, asthma, whooping cough, etc. Fraudulent therapeutic claims—[N. J. 23280, May, 1935.]

**Rawleigh's Liniment.**—W. T. Rawleigh Co., Freeport, Ill. Composition. Essentially red pepper extract, camphor, pine oil, an ammonium compound, alcohol and water. Fraudulent therapeutic claims—[N. J. 23280, May, 1935.]

**Rawleigh's Pain Relief.**—W. T. Rawleigh Co., Freeport, Ill. Composition. Essentially red pepper extract, camphor, soda, an ammonium compound, alcohol and water. Fraudulent therapeutic claims—[N. J. 23280, May, 1935.]

**Marisco Menthol Inhaler.**—John M. Maris Co., Inc., New York. Composition. Menthol in an inhaler. For catarrh, hay fever, asthma, etc. Fraudulent therapeutic claims—[N. J. 23283, May, 1935.]

**Bulgarian Marvel Herb Tea Compound.**—Marvel Products Co., Pittsburgh. Composition. Essentially epsom salt (10.3 per cent), senna leaves, bearberry leaves, sassafras bark, licorice bark, dog grass, elder flowers, lavender flowers, fennel seed and anise seed. For stomach, liver, kidney and blood disorders. Misbranded because not of Bulgarian origin and because not composed entirely of herbs. Fraudulent therapeutic claims—[N. J. 23284, May, 1935.]

**Grove's Emulsified Nose Drops.**—Paris Medicine Co., St. Louis. Composition. Essentially ephedrine hydrochloride, menthol, a chlorine compound, mineral oil and water. Not germicidal, as represented. Fraudulent therapeutic claims—[N. J. 23285, May, 1935.]

**Amenoco Capsules.**—Purity Drug Co., Inc., New York. Composition. Essentially quinine sulfate (0.86 grains per capsule), aloë, powdered plant material, and essential oils including pennyroyal oil. For menstrual disorders. Misbranded because contents were misrepresented and because of fraudulent therapeutic claims—[N. J. 23293, May, 1935.]

**Manikin Tea.**—Manikin Products, Inc., New York. Composition. Essentially senna leaves, calendula flowers, coriander fruits, anise seed, marine algae (fucus), sassafras bark, corn flowers and althea roots. For obesity. Fraudulent therapeutic claims—[N. J. 23289, May, 1935.]

**Live-On Tonic.**—Live On Medicine Co., St. Louis. Composition. Essentially plant drug extracts including rhubarb, with alcohol, sugar and water. Fraudulent therapeutic claims—[N. J. 21227, August, 1934.]

## Correspondence

### LEUKEMIA OR POLYCYTHEMIA

*To the Editor:*—The article "Leukemia with Thrombocytosis" by Dr. Carl B. Drake in *THE JOURNAL*, March 21, interested me very much. It is unfortunate that the case is labeled "leukemia" and not "polycythemia," since the report brings up a number of points of interest in connection with the latter disease. First of these is the hemorrhagic tendency in polycythemia, which is often quite striking and has been commented on by many observers. In my own series of twenty cases it has been a common symptom. The bleeding may be spontaneous, as from the nose, the stomach or the bowel, or it may be present as a persistent oozing following such operative procedures as extraction of teeth or abdominal operations. The tendency to bleed appears to have nothing whatever to do with the platelets, the bleeding time or the clotting time but is probably the result of injury to the widely overdistended capillaries which are a feature of the disease.

A platelet count of 2.5 million per cubic millimeter was not at all unusual in my own series of cases. The count is usually in the neighborhood of 1 million; in four cases the platelet count has remained consistently between 2 and 3.3 million with a corresponding increase in the platelet volume, which may be as great as 3 per cent of the total volume of blood. Bits of megakaryocytes are not infrequently found. As in Dr. Drake's case, extreme elevation in platelets may be present even though the erythrocyte count is not excessive. In two of my cases the platelets ranged between 2.5 and 3.3 million per cubic millimeter, with red cell counts between 5.5 and 7 million. This is not difficult to understand when one observes the bone marrow, which shows great hyperplasia not alone of the red cell forming elements but of the leukocytes and megakaryocytes as well. Indeed, the latter structures are sometimes so numerous that they may overshadow the rest of the cellular tissue. This hyperplasia of all the marrow elements is reflected in the blood picture, which shows an increase in red cells, white cells and platelets. Polycythemia should thus be considered a disease not alone of the red cells but of all the cells formed in the marrow. The three elements need not necessarily be elevated in the same relative fashion, in some cases the platelets, in others the leukocytes being in the ascendency. The white cells are frequently immature, myelocytes, even myeloblasts, at times being seen. Indeed, the leukocytic picture is sometimes so abnormal as to suggest myeloid leukemia.

In a woman presenting, as in the case report referred to, a plethoric appearance, cyanosis of the lips, prominent retinal veins, splenohepatomegaly, hypertension, a hemorrhagic tendency, oozing of blood following operation, rapid return in erythrocyte count following hemorrhage and elevation in the red cell count to 5.8 million, elevation in the leukocyte count, elevation in polymorphonuclears, and extreme elevation in platelet count, it seems unwise to make the diagnosis of leukemia, especially since all these features are quite typical of polycythemia.

WILLIAM DAMESHEK, M.D., Boston.

## Queries and Minor Notes

ANONYMOUS COMMUNICATIONS and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

### PULMONARY HEMORRHAGE

To the Editor—Mrs E. W., aged 50, white, is subject to periodic pulmonary hemorrhages. She reports having had the first when she was 30 years old and then none for thirteen years. Following the second she has had them every year or two. The majority have come in the spring, although she had one at Christmas time and the last one came in January of this year. The attacks come on suddenly, with little warning, and irrespective of what she happens to be doing at the time. The quantity of blood varies considerably. I have seen her in two attacks, and during the last (the most severe so far) she lost easily a quart of blood. This last bleeding began about 1 p. m. and continued until almost 6 o'clock, in spite of all measures used. Opiates, ergot and fibrinogen, with an ice pack over the chest were used. Following the hemorrhage, blood streaked sputum was expectorated for a couple of days, followed by dirty, brown sputum for a couple of weeks. The patient complained of a soreness over the right lung in the upper part of the chest. Following the hemorrhage, her blood pressure was 155 systolic, 90 diastolic, her pulse 81 and regular. Her present weight two months after the attack is 211 pounds (96 Kg.). Her blood count now is 5,000,200 red blood cells, 5,800 white blood cells, hemoglobin 70 per cent, coagulation time four minutes for a drop on a slide. Following an earlier hemorrhage, the patient reports an examination by a competent internist, with roentgenograms, and a report by him as to conditions in the chest. I would be grateful for suggestions as to the cause of these hemorrhages and their treatment. The patient looks forward with apprehension to these attacks.

M D, Illinois

ANSWER.—Pulmonary hemorrhage is caused by a number of conditions, not all of which are easily detected without special methods of examination. With the first hemorrhage occurring about twenty years ago, the second seven years ago, and a hemorrhage every year or two for the last seven years, one must consider such conditions as bronchiectasis, pulmonary abscess, pulmonary tuberculosis, broncholithiasis and varices of the trachea and bronchi. While it is probable that all the hemorrhages have been caused by the same condition, it is entirely possible for a new condition to have more recently developed, such as malignancy.

Good x-ray films of the chest in the anteroposterior and oblique diameters might be helpful in locating the condition. While it is impossible to determine with accuracy the etiology from x-ray films, the location of shadows facilitates other methods of examination. If shadows are found in the bases of one or both lungs, one should immediately investigate whether there is much sputum present and whether it has a fetid odor. The laboratory examination of the sputum for tubercle bacilli, fungi, spirochetes and fusiform bacilli may determine the etiology. However, if none of these micro-organisms are found, the introduction of iodized oil into the involved area followed by x-ray films may bring to light sacculations or dilatations of bronchial ramifications indicating bronchiectasis or even abscess cavities which could not be visualized by films made without the use of iodized oil. Moreover, the part of the lung and bronchial tree lying anterior to or posterior to the dome of the diaphragm and not ordinarily visualized may be distinctly outlined by the iodized oil, which casts a denser shadow than the dome of the diaphragm and subphrenic structures.

If the shadows are located in the upper half of one or both lungs, one should suspect tuberculosis more strongly and should put forth special effort to recover tubercle bacilli from the sputum, not only by numerous direct smear microscopic examinations but also by animal inoculation, culture and flotation methods. At the same time, one should make a careful search for other micro-organisms. In the event of failure to find any specific micro-organisms, if the sputum is foul one is justified in introducing iodized oil and making further x-ray films, since pulmonary abscess and bronchiectasis occasionally exist in the upper lobes.

When the microscopic examination and the iodized oil fail to reveal evidence of etiology, one is justified in making a bronchoscopic examination for the purpose of inspecting as much as possible of the involved region and if necessary the removal of a small amount of tissue for biopsy.

If the original x-ray film reveals no abnormal shadows except evidence of calcium deposits in the hilus or Ghon tubercle formation in the lung parenchyma, one must not overlook the fact that such calcium deposits through their sharp edges are capable of cutting through the walls of ramifications of the bronchi and producing hemorrhage. In some cases these calcium deposits will find their way into the lumen of a bronchial ramification and may be expectorated as a lung stone, or they

may be aspirated into a dependent part of the bronchial tree where they may set up a foreign body abscess. Again, they remain in the tissues adjacent to the bronchial wall and may be the cause of repeated hemorrhage. In such cases bronchoscopic examination may be the only method of determining the source of the hemorrhage. This is also the only method of determining the source of hemorrhage due to varices.

In some cases even bronchoscopic examination in the interval between hemorrhages produces no significant evidence, and therefore it becomes necessary to make this phase of the examination soon after a hemorrhage, while there is still some blood present which the bronchoscopist can trace to its source. Not infrequently the bronchoscopist finds previously unsuspected malignant, syphilitic or tuberculous lesions and occasionally previously undetected foreign bodies as the cause of hemorrhage.

One must not overlook the fact that repeated pulmonary hemorrhages are not infrequently caused by mitral stenosis. Therefore, careful examination of the heart is always indicated in such cases.

### EXFOLIATIVE DERMATITIS

To the Editor—I have a patient who has been diagnosed as having dermatitis (eczema) exfoliativa by a specialist in New York and Philadelphia and who has applied all kinds of ointments and antiseptic solutions without any result. It followed a nervous breakdown of two years' standing. He has been given solution of potassium arsenite by mouth, colloidal sulfur by vein and muscle, colonic irrigations, large doses of bromides, and other sedatives, yet the skin condition persists. I wonder if you can help me relieve this patient of some of his skin irritation. The Wassermann reaction is negative, blood chemistry is normal, the blood count is normal, urinalysis is normal, the basal metabolism is normal and gastric analysis is normal. He has also had an autogenous vaccine made from the lesions, a mixed staphylococcus and streptococcus vaccine, and small roentgen and ultraviolet treatments. I should like to know the possibility of his having a Monilia infection, as was diagnosed by one pathologist. Please omit name.

M D, New Jersey

ANSWER.—The occurrence of an exfoliative dermatitis presents a number of diagnostic possibilities. One must rule out the possibility of the condition being on a toxic (drug) basis secondary to arsenic or other heavy metal intoxication. Although now normal, the blood count should be repeated at regular intervals to rule out the prodromal stage of one of the lymphoblastomas. Is there any glandular or splenic enlargement? If a gland is enlarged, it as well as the skin should be examined microscopically to rule out a leukemia, pseudoleukemia or related conditions. A generalized monilia infection or a secondary toxic monilia is a possibility. With these, however, there should be a definite picture of an active yeast infection in the intertriginous areas, such as the groin, inframammary region, pendulous folds of the abdomen, or the axillae. While these conditions might simulate an exfoliative dermatitis, there is a greater tendency usually to moisture and oozing in yeast infections. Cultural examination for monilia should be made, but one must bear in mind that yeast may occur as a secondary invader in chronic exfoliative processes of the skin.

Any etiologic factor that may be revealed by further examination should be treated specifically. The use of warm alkaline and starch baths, bland ointments, equal parts of solution of calcium hydroxide and olive oil, a high vitamin diet (vitamins A, B and D), high caloric feedings and sodium thiosulfate intravenously are recommended. Autohemotherapy and dicalcium phosphate by mouth may also be used.

### STRICTURE OF RECTUM

To the Editor—I have three cases of stricture of the rectum. I have been told that the majority of cases of stricture of the rectum are due to granular inguinal, and not due to syphilis, as we were taught up to a few years ago. Would you please send me complete data?

JOSEPH HALTON, M D, Sarasota, Fla.

ANSWER.—Strictures may be either malignant or benign and the latter may be inflammatory, syphilitic, gonorrheal, tuberculous, traumatic, dysenteric, and so on.

It is assumed that the three cases of stricture of the rectum mentioned in the query are examples of "inflammatory rectal stricture." Recent investigations have led to the belief that "syphilitic" stricture of the rectum is uncommon and that the coarctation so named is often caused by the virus of lymphogranuloma inguinale. The more common synonyms for this disease are the disease of Nicolas and Favre, poradenitis, climatic bubo, the sixth venereal disease, esthiomene, anorectal syphiloma, and the genito-ano-rectal syndrome.

The term "granular inguinal" as given in the query has no doubt been mistaken for the disease known as "granuloma inguinale." This entity has been confused with lymphogranuloma inguinale. As a means of avoiding such an error it has

been suggested that the title "lymphogranuloma inguinale" be changed to "lymphopathia venereum." The name "lymphopathia venerea" has also been suggested.

H. Stannus Stannus, in the preparation of his monograph entitled "The Sixth Venereal Disease," has reviewed more than 900 papers. He explains much of the confusion that existed formerly by the fact that climatic bubo, inflammatory rectal stricture, esthiomene and the like were believed to be separate clinical entities. It is now thought that these are among the various manifestations of a single disease entity, lymphopathia venerea.

The disease is usually venereal in origin. The primary external genital lesion in the male results in inguinal adenitis because of the nature of the lymphatic drainage of the external genitalia. When the primary lesion of the male is carried to the female, her initial lesion is likely to develop on the vaginal wall or on the cervix. The perirectal lymphatics are then involved either directly by way of the lymphatic network of the rectovaginal septum or indirectly through their connections with the vaginal and cervical collecting vessels lying in the rectal stalks. This is believed to be at least a part of the probable mechanism of the pathogenesis of inflammatory rectal stricture in the female. This type of stricture of the rectum does occur in the male, owing probably to sodomy or to a spread of the virus from anal to rectal lymphatics.

An excellent aid to the diagnosis of lymphopathia venerea is the skin reaction known as the Frei test. Probably the most suitable Frei antigen available at present is that prepared by Lederle from lymphogranulomatous mouse brains.

In addition to Stannus's monograph, the following works are recommended:

#### HYPERTENSIVE DISEASE

To the Editor:—In one specific case (in a Negro) the blood pressure reading, some five years ago, was 220 systolic, 150 diastolic. During the past years the blood pressure has been 120/80. In the five years the patient had what he described as paresis of the left upper face, which today is barely demonstrable. This is one of several cases in which marked hypertension cleared up after some injury. What would probably be the disease condition in this case and the explanation as to why the blood pressure returned to within normal limits and the patient is comparatively well.

E. J. BERANGER, M.D., New Orleans.

ANSWER.—The query does not state whether the hypertension of 220/150 five years ago was found on only a single observation or repeatedly and, if repeatedly, over how long a period. This is an essential point, for one must distinguish between the "hypertensive state" and "hypertensive disease." A state of hypertension or increased blood pressure may exist transiently without instituting the progressive changes of hypertensive disease (often loosely termed "essential hypertension"). The state of hypertension has the same physiologic background as the hypertension in hypertensive disease. Hypertensive disease is instituted by prolonged hypertension and may be said to occur when the hypertension becomes persistent and progressive. There are many factors that may cause a transient hypertension which subsides when the etiologic influences cease to operate. These etiologic factors may initiate hypertensive disease in constitutionally vulnerable individuals and/or when the provocative influences are of long duration. Eclampsia may be cited as an example; with the subsidence of the acute intoxication the arterial tension falls and persistence of hypertension and the initiation of hypertensive disease are the exception rather than the rule. If progressive hypertensive disease is initiated by eclamptic intoxication it implies a notably vulnerable constitution and susceptible vasomotor apparatus. Acute plumbism, psychic turmoil, fear, acute nephritis with good repair and other intoxications may cause a transient state of hypertension.

Hypertensive arterial disease manifests little or no tendency to remission; it is typically a persistently progressive disorder, varying greatly however in the rate of progression in different individuals.

The localized facial paresis may have been purely coincidental. There is no evidence presented in the query implying a necessary correlation of the reduced arterial tension and the

paresis. It is conceivable, but highly improbable, that a cranial injury would so affect rather permanently the vasomotor center. Before drawing any conclusions from the statement that "marked hypertension cleared up after some injury" one must know the duration as well as the intensity of the hypertension existing prior to the injury, the nature of the injury and many other factors. No generalization is warranted by the present state of knowledge.

#### INVESTIGATION OF THYROID DEFICIENCY

To the Editor:—A white woman, aged 28, of American birth, felt normal until the age of 13. At that time menstruation began and she noted a marked diminution of her normal vigor and wished only to lie down. The menses were irregular from the start. She remained quite thin until the age of 17, when in two months she gained 22 pounds (10 Kg.), mostly in the form of a boggy swelling of the cheeks, under the arms and of the ankles. At this time she noted amenorrhea of three months' duration. After the next menstrual period the swelling disappeared and she felt slightly more vigorous. Physical examination was supposedly negative. At 18 she noticed a slight diffuse enlargement of the thyroid. After this she experienced more nearly her usual pep and vigor and lost practically all the swelling. Shortly after this a tonsillectomy was done and two weeks later an acutely inflamed appendix was removed. At 24 the thyroid was much larger and a lump was seen in the right side of the gland. Edema of the face, chest and ankles began again. One year later a thyroidectomy was done, at which time the basal metabolic rate (previous to operation) was minus 17. Four days after the operation, thyroid was started by mouth and has been continued since. She does not know what her blood pressure and pulse were before the operation, but both were elevated afterward and the edema was worse. She has been extremely nervous, has not menstruated, and has been unable to get the basal metabolic rate above —13 since that time. Her nails have broken off easily and her hair and skin have been extremely dry. There has been no interest in anything and she has wanted to rest all the time. Sexually she is very cold. She appears very plethoric but mentally is alert and keen. She is normal except for the dryness of the skin, brittleness of the nails, and puffiness of the cheeks, chest and ankles. Her legs are almost bronzed practically to the hips. The ankles pit slightly on pressure. The pulse rate is 132 and the blood pressure 155 systolic, 118 diastolic. The blood and the urine are normal and the basal metabolic rate is —23. I should like to have a complete diagnosis, if possible, and to have some suggestions as to possible treatment. Please omit name.

M.D., Michigan.

ANSWER.—The correspondent's problem is a difficult one. No explicit diagnosis can be given without further study. Needed are urinalysis, tests of renal function, a series of metabolism determinations under basal conditions, a study of pulse rate and blood pressure during sleep and rest, and a study of sex hormones in the blood and urine. No opinion can be given relative to the adequacy of thyroid administration, as the correspondent does not state how much thyroid the patient has received. Moreover, there is wide variation in the amount of thyroid needed to elevate the metabolisms of patients with low metabolisms without myxedema. Provided there is no kidney disease, the hypertension is relatively insignificant, the pulse rate is normal under resting conditions, and the basal metabolism is consistently low, thyroid should be given in amounts sufficient to raise the metabolism gradually to a point within the accepted range of normal. If the condition of the patient improves under these circumstances, medication with thyroid could be continued. If no improvement results, intensive investigation is indicated.

#### HAIR DRESSING FOR ASTHMATIC CHILD

To the Editor:—Will you kindly suggest either the name or the formula for a hair dressing for an asthmatic child? Skin tests have shown that the child is sensitive to numerous proteins. Petrolatum has been unsatisfactory. The numerous popular hair dressings have an odor to which I am afraid the child may prove sensitive. Please omit name.

M.D., New York.

ANSWER.—To obtain a hair dressing to which an asthmatic child cannot be sensitized is impossible; but it should be easy to obtain one to which this particular child is not at this time sensitive. An alcoholic solution of castor oil, slightly scented with some perfume, as lemon verbena, to which the child is not sensitive, may give satisfaction. Castor oil is chosen because it is somewhat soluble in alcohol. If the child is sensitive to the oil or the perfume, other oils or perfumes may be substituted.

If, as the trial of petrolatum suggests, a dressing is desired that will paste down the hair, "set it" in rigid ringlets, as is the barbarous custom, the difficulty is somewhat greater. Mix 0.1 Gm. of tragacanth powder with 0.2 cc. of isopropyl alcohol in a large dry bottle. Add 8 cc. of hot water and shake vigorously. Dissolve 0.25 cc. of terpinol in 9.8 cc. of isopropyl alcohol and add it in small amounts to the mucilage of tragacanth, shaking the mixture each time. Then add rose water to make 100 cc. The hair may be wet with this before curling, provided no sensitization exists to any of the ingredients. Any procedure that interferes with vigorous daily brushing should be frowned on, for it deprives the scalp of needed stimulation.

## ANEMIA IN CHILD

To the Editor—A woman, American, aged 21, married, gave birth five years ago to an apparently normal 6 pound (2.7 Kg.) boy. At the age of 7 weeks and a few days he began refusing feedings at night. I was called to see the child about one week after it became sick. Realizing that the child was almost in a dying condition, I did a transfusion but death occurred in three or four hours. Because of the hurry I did not get a blood study. Apparently some severe anemia existed. I operated on the mother about three years ago, following the birth by two years. I did an appendectomy, suspension of the uterus and perineal repair but preserved the child bearing function because the couple earnestly desired a child. July 27, 1935, she gave birth to an apparently normal female child weighing 7 pounds 3 ounces (3,260 Gm.) It got along well for about three weeks, then on two occasions I was called out at night to see it. The child seemed to have had convulsions and stiffened out but, by the time I arrived, was apparently normal. It was always pale, especially the mucous membranes, but seemed to be gaining in a perfectly normal fashion and I did not make a blood study. At the age of 10 weeks it began to vomit all the feedings, and under change of diet it still vomited considerable (tentative diagnosis pyloric stenosis), and on the second day of illness, in addition to this pallor, it commenced to have a greenish cast. I then rushed it to the children's hospital realizing that the condition was an anemia. An immediate transfusion was performed. The blood picture was aplastic anemia with no evidence of regeneration of red blood cells (no immature forms found), and hemoglobin 20 per cent. The child died in twenty-four hours. Is it safe for these parents to have other children? Can the history of the first birth be linked with the second as a similar and hereditary condition? Would earlier treatment have been effective?

M D, Ohio.

ANSWER.—The clinical descriptions and the blood examinations mentioned in the query are not sufficient to permit definite differential diagnosis as to the nature of the anemia. One recognizes several forms of familial anemia in new-born infants.

First there is the rarely occurring congenital, aplastic anemia, in which the blood shows no tendency to regeneration, red cells are diminished, there is a leukopenia, with relative increase of lymphocytes, and the blood platelets are markedly diminished. The bone marrow is white, composed of fat.

Second, sickle cell anemia may cause a hemolytic anemia, or the characteristic changes in the shape of the cells may be found without anemia. This variety occurs most commonly among Negro children, in many of whom the sickling remains latent. When the disease is active it tends to run a protracted course. Patients who are ill with this form of anemia are subject to intercurrent infections during which a severe anemia occurs.

Third, primary hemolytic anemia (familial hemolytic jaundice) is characterized by severe anemia, varying degrees of jaundice, large spleen, and increased fragility of the red cells in the presence of hypotonic salt solutions. This form of combined anemia and icterus may occur in successively born babies.

In this connection, too, must be mentioned familial icterus gravis, which affects several babies of the same family successively. The infant as a rule becomes violently ill within twenty-four or thirty-six hours after birth, with increasing jaundice. The condition terminates fatally with convulsions in a few days, though the disease may last for weeks, and some recoveries have been reported.

Whether it is safe for these parents to have other children cannot be answered categorically. Without doubt there is a definite hazard for the next baby, though cases of familial icterus gravis are recorded in which one or two normal infants have been born and remained well while several others have died. From what has been said it is probable that the two infants died of the same disorder. In rapidly progressive cases of familial icterus gravis no form of treatment has been of any avail.

## SYPHILITIC OPTIC ATROPHY

To the Editor—I have a patient who has optic atrophy (syphilitic) in one eye with some pallor of the disk and vision of 20/25. The field extends out about 30 degrees (for 18/360 mm object). The other eye is normal in vision with a slight concentric contraction of the peripheral limits of the field. He has been treated for several months for a syphilitic infection. During the treatment the peripheral limits of vision became contracted. What is the best preparation to use for general infection when an optic atrophy or optic neuritis is present?

WENDELL L. HUGHES, M D, Hempstead, L I., N. Y.

ANSWER.—The use of arsenicals in the treatment of syphilitic optic atrophy should be stopped at the first sign of constriction of the peripheral fields. Even tryparsamide is not recommended when such a condition exists. Most men are using bismuth compounds intramuscularly. For the optic atrophy E. Stastnik (*Ceskol ofthal.* 1:114, 1934) recommends the use of gold chloride. A. Busacca (*Klin. Monatsbl. f. Augenh.* 90:352 [March] 1933) reported on the use of sulfur in this condition, and B. Fleischer (*Klin. Monatsbl. f. Augenh.* 90:335 [March] 1935) reported favorable results with fever therapy.

L. L. Mayer and R. D. Smith (*Illinois M. J.* 65:258 [March] 1934) reported the study of a series of cases treated with tryparsamide, and N. K. Lazar (*Arch. Ophthalm.* 11:240 [Feb] 1934) reported a similar series treated with neoarsphenamine. Retrobulbar injections of atropine sulfate have also been used but favorable results have not occurred. The safest, and preferable, medication is a bismuth compound intramuscularly.

## DIFFERENTIAL DIAGNOSIS OF GONORRHEAL ARTHRITIS

To the Editor—A man, aged 36, a Spaniard, whose previous history was negative except for gonorrhea about fifteen years ago, in May 1911 developed pain in the right heel and a stiff neck, which disappeared with sodium salicylate. The temperature at the time was 103 F., the pulse 120. Since then he has had migrating pains in all the joints of the body but no fever. Physical examination is always negative as to swelling, tenderness, murmurs, temperature and pulse rises. His pains have not been relieved by salicylates since the first attack. The patient is an etcher of glass, using hydrofluoric acid and hydrochloric acid. He works alternate weeks and has noticed that after working (standing for eight hours), the pains begin in the heel and then migrate to the joints (large and small). The weeks that he does not work he feels better. He has had diathermy, salicylates and has just had 2 cc. of a preparation containing 20 mg of colloidal sulfur intravenously twice weekly for six weeks with the result that the pains are less severe. Is there anything else that I can do for the patient? Has the old gonorrhea anything to do with his arthritic pains? Has his occupational use of the hydrofluoric acid any factor in his case? Please omit name.

M D, New York

ANSWER.—Though the case sounds most like that of a focal infection, no mention is made of studies for such conditions, hence it is impossible to discuss it categorically. While gonorrhea may or may not have been a factor in the production of a chronically infected prostate, there is not the remotest likelihood of the case being one of gonorrheal arthritis after such a lapse of time. Search of teeth, tonsils, prostate and, possibly, the gastro-intestinal tract might reveal an underlying cause. Obviously the exciting cause is postural. Underlying all there probably is some perversion of physiologic function that favors early fatigue as well as focal infections.

So far as his contacts with hydrofluoric and hydrochloric acids are concerned they apparently can be disregarded. Inquiry among those who for years have employed glass etchers fails to reveal a single case of arthritis among them.

Treatment apparently rests in correction of perverted physiologic function, removal of foci of infection, correction of postural defects, rest in the unemployed periods and possibly muscle strengthening exercises.

## SIGNIFICANCE OF CHANGES IN BLOOD PRESSURE

To the Editor—A man aged 40, was rejected for life insurance because of a blood pressure of 190 systolic, 130 diastolic. The systemic history and physical examination were negative except for low grade auricular fibrillation. The past history was absolutely negative except for a frequent intense pulsating headache, generally distributed over the head. On a prescription of sodium nitrite one-half grain (0.03 Gm.) glyceryl trinitrate 1/50 grain (0.0004 Gm.) and sodium bromide 3 grains (0.2 Gm.) four times a day, the blood pressure one week later was 170/140, without headache. The Mosenthal test was negative, and the cardiac rhythm was regular. One week later the blood pressure was 155/145. I have discontinued the prescription for a while. Why should the diastolic pressure approach the lowering systolic, and what may result from this low pulse pressure? Kindly omit name.

M D, Pennsylvania

ANSWER.—The rise in diastolic pressure is of ominous import, particularly if it persists. The diminishing pulse pressure resulting from the reduction of the systolic tension implies a weakening myocardium, which is asthenic and no longer fully competent. Such an interpretation would be confirmed by a rising pulse rate; the pulse rate is not mentioned in the query. The rise in diastolic pressure may have been secondary to the diminished pulse pressure because of histanoxia of the cerebral vasomotor centers, or it may possibly be attributed to a paradoxical reaction to nitrites. The dose of nitrites was rather large. Burgess and others have reported a secondary rise in diastolic tension occurring after the preliminary fall on administration of glyceryl trinitrate or amyl nitrite. The more probable explanation is the former. The effects of hypertension are due to maldistribution of this, that or another vital parenchymatous tissue. The capillary circulation rather than being increased by hypertension is grossly diminished by arteriolar constriction. It should be emphasized that the site of the increased resistance responsible for the diastolic hypertension is in the arterioles, proximal to the capillaries.

An amyl nitrite test (Stieglitz, E. J.: Arterial Hypertension, *Arch. Int. Med.* 46:227 [Aug.] 1930) might prove most illuminating in this instance. If extensive arteriolar sclerosis already exists (as evidenced by failure of the diastolic tension to fall

greatly on inhalation of amyl nitrite), vasodilator or any other medication will and can accomplish but little and treatment must be then directed toward maintaining the cardiac vigor. The cardiac nutrition must be considered as of primary importance and an adequate supply of dextrose and oxygen assured; anemia, which is common in hypertensive arterial disease, requires energetic treatment.

#### SCARRING AFTER TONSILLECTOMY

*To the Editor:*—Some one has attempted to prove recently that the tonsil has no real capsule and that, in removing it, one dissects it out of the fascia separating it from the muscle structures adjacent. If this is true, it might offer a partial explanation for the fact that in many cases in spite of what appears to have been good surgery there has been contracture, scarring or obliteration of the pillars. If the tonsil has no capsule and is merely attached by fascia, this would appear to be an after-effect that would be difficult to avoid in many cases, owing to the contractures in the contour of the tonsil fossa in the process of healing. I have looked into many throats, especially of children, and found the condition. It also occurs in adults in whom a careful inspection immediately following operation shows no apparent injury to the pillars. Is the "disappearance," "absorption" or "destruction" of the pillars following tonsillectomy always the result of faulty technic? Please omit name.

M.D., Missouri.

*ANSWER:*—The statements concerning the so-called capsule of the tonsil are substantially correct. What is designated as the "capsule" is in reality that part of the fascia covering the superior constrictor muscle which clings to the tonsil following its removal.

As to scarring after tonsillectomy, it is probably true that part of the time the ill effects observed are due to faulty technic and that part of the time with the best of technic the scarring is due to individual peculiarities in healing. As most people do not complain, failure to get a cosmetically perfect result following a proper tonsillectomy is of no practical significance.

#### OTOSCLEROSIS

*To the Editor:*—A woman, aged 28, gave birth to a child seven years ago. During the third month of this pregnancy she began to complain of head noises and impaired hearing. As the years have passed, her hearing has become progressively worse. This condition has been diagnosed by different ear specialists as otosclerosis. They have advised various forms of treatment. Despite it all, her condition is growing worse. The patient is very anxious to have another child despite the possibility of a pregnancy exaggerating her illness. In view of the fact that she may become worse whether she is pregnant or not, should she be allowed to become pregnant again? Kindly advise me as to any form of treatment that you think may improve or check this condition. If there are any special references which you think are of any value in treating this condition, please advise me. Please omit name.

M.D., New York.

*ANSWER:*—From the history as given and from the fact that the hearing has become progressively worse the diagnosis of otosclerosis, especially if it has been confirmed by functional tests of hearing, is probably correct. There is today no treatment for the cure of otosclerosis or for the palliation of the condition. It is quite true that without becoming pregnant the patient may suffer a further loss in hearing. It is also true that she need not necessarily become more deaf if she becomes pregnant again. The choice as to a second pregnancy, in the opinion of many men, would lie entirely with the patient, as she is the one who makes the sacrifice. Furthermore, if she is already so deaf that unaided by a device she cannot hear normal conversation, whatever impairment the next pregnancy might produce will not make a great deal of practical difference.

#### SENSITIZING AGENT IN RHUS POISONING

*To the Editor:*—I was told recently that the etiologic agent producing dermatitis venenata was the same in all the members of the genus *Rhus*; that is, that if an individual was sensitive to *Rhus toxicodendron* he would also be sensitive to *Rhus diversiloba*, *Rhus vermicifera*, and so on. My informant was unable to state the source of his information. Do you know of any work done to substantiate this?

C. RUSSELL ANDERSON, M.D., Canby, Minn.

*ANSWER:*—The opinion of investigators on the subject is that the active ingredient of all the species is a phenolic resin, "toxicodendrol," contained in the sap obtained when the plant is injured. Authorities state that this substance is identical or very similar in all the *Rhus* species. Investigation has shown that 0.001 mg. applied to the skin results in severe vesiculation. Members of the group in which this has been found are *Rhus toxicodendron*, *Rhus diversiloba* and *Rhus vernix*. Complete literature and discussion can be found in: McNair: *Rhus Dermatitis*, University of Chicago Press, 1923; Pfaff: *J. Exper. Med.* 2:181, 1897; Ford, W. W.: *Centralbl. f. Bakt.* 58:129, 1913.

#### RADIODERMATITIS

*To the Editor:*—I have a patient who is suffering from a severe dermatitis involving the complete right pectoral region. It is erythematous, vesicular and angiomatous, and it causes a great deal of itching. The patient was operated on for cancer on that side twelve years ago, when a complete mastectomy was done, followed by roentgen therapy. Do you believe that there is a relationship between the present dermatitis and the roentgen therapy given twelve years ago, and also what is the proper therapy?

M.D., New York.

*ANSWER:*—The description is that of a radiodermatitis appearing as a sequel to intensive roentgen therapy administered after the mastectomy. The present dermatitis has probably existed in mild degree associated with atrophy, telangiectasia and some pigmentation for some time and has probably become more acute recently because of local irritating factors.

While soothing lotions and bland ointments are effective, more recently excellent results have been obtained through the application of aloe vera in the form of the leaves (Collins, C. E., and Collins, Creston: *Am. J. Roentgenol.* 33:396 [March] 1935. Wright, C. S.: Aloe Vera in the Treatment of Roentgen Ulcers and Telangiectasis, *THE JOURNAL*, April 18, p. 1363).

#### DISABILITY AFTER ABDOMINAL OPERATION

*To the Editor:*—I should like to know what the accepted time is before a man returns to work after he has had an abdominal operation. In other words, after a man has had an abdominal operation, what is the accepted time of disability before he should return to work, or just how long should he refrain from working so as not to injure his side?

M.D.

*ANSWER:*—There is no generally accepted period for disability following an abdominal operation.

It is not unusual for a person to return to office work in from three to four weeks. Light work may often be permitted in from four to six weeks. If one must return immediately to heavy work, two months is usually advised. The extent of the operation, condition of the patient, type of incision, occurrence of minor or major complications and various other factors may prolong the period of disability.

#### DIARRHEA FOLLOWING USE OF GALLBLADDER DYE PREPARATION

*To the Editor:*—Quite frequently when a tetraiodophenolphthalein preparation is given orally, and with the proper preparation, that is, a fat-free diet and no cathartic, the patients will present themselves the following morning stating that they have had a severe diarrhea since taking the dye. Roentgen examination of the gallbladder reveals no concentration. What condition or conditions will produce this diarrhea, and what is the most common cause? Is there any way to prevent subsequent administrations of the dye from producing the same results? Please omit name.

M.D., Missouri.

*ANSWER:*—Diarrhea following gallbladder dye preparations is due to the essentially cathartic nature of the phenolphthalein radical. Patients who give this reaction should receive a preliminary dose of powdered opium 0.060 Gm. or tincture of opium 1 cc., which will prevent the diarrhea and secure retention of the dye and its concentration in the gallbladder.

#### CLIMATIC TREATMENT OF BRONCHITIS

*To the Editor:*—A boy, aged 9 years, is susceptible to acute bronchitis. Would North Carolina be a good climate for him? His bronchitis is rather nonproductive—that is, he does not bring up much phlegm. What towns or states would be best for him and especially as to North Carolina? Please omit name.

M.D., Chicago.

*ANSWER:*—A locality in North Carolina known for its equable temperature would doubtless be beneficial. A place farther south, as in Florida, might offer more advantages. The Southwest is especially desirable because of its dry climate. The change of location, as well as other treatment, will depend on just what the "bronchitis" is. In children, a granular pharyngitis is a frequent cause, and such a condition does well in the Southwest.

#### MEASUREMENTS OF PREGNANT UTERUS

*To the Editor:*—Will you please inform me as to the metric measurements of a two months pregnant uterus of a primipara? I am unable to find this information from any of my medical books. The woman weighs about 120 pounds (54 Kg.).

FRANK A. RENDE, M.D., Bottineau, N. D.

*ANSWER:*—The nonpregnant uterus generally measures from 6.5 to 7 cm. In a primipara, at the end of a two months gestation, the length of the uterus is approximately 9 to 9.5 cm.

## Book Notices

**The International Labour Organisation and Social Insurance.** International Labour Office, Studies and Reports, Series M (Social Insurance), No. 12. Paper. Price, \$1.50; 5s. 6d. Pp. 219. New York: World Peace Foundation; Geneva, 1936.

This is a continuation of previous studies and reports. It summarizes developments in social insurance throughout the world. The various conventions that instructed the International Office to support social insurance are given. The report is prefaced by an argument in favor of such insurance. Legislation in the various countries on workmen's compensation, sickness insurance, invalidity, old age, widows' and orphans' insurance and on migrant workers' pensions are listed according to date in various countries. The section on sickness insurance notes (p. 51) that "the principal object is now to restore health and working capacity, and first place is therefore given to medical, surgical and pharmaceutical benefits." The function of compensation has given way to that of restoration. There is no discussion of the fitness of institutions organized as dispensaries of cash benefits to become administrators of medical care. The attitude on the relations of insurance carriers to the medical profession is seen by the statement that the International Conference (p. 54) "did not go into the matter of medical fees, but the precautions it took to protect insurance institutions against exaggerated demands show that it was aware of the need for organizing the medical service of insurance institutions on rational and economical lines." There is no suggestion that the quality of the medical service needed to be protected or of the possibility of the deterioration of such a system under insurance. This report with the preceding ones in the same series forms the largest compilation of source material on social insurance throughout the world.

**A Square Deal for the Narcotic Addict.** By William H. Ladue, M.D., Attending Physician, Champlain Valley and Physicians Hospitals, Plattsburgh, New York. Paper. Price, \$1. Pp. 131. Plattsburgh, New York: The Author, 1935.

According to the author this little volume was written for the purpose of initiating discussion on the narcotic drug addiction situation in America, with special relation to its proper placement among our social problems. He dedicates his book by a quotation from Sir Arthur Helps, "The world will tolerate many vices but not their diminutives." This quotation may imply that the author regards drug addiction as a diminutive or insignificant vice. It is evident, however, that this implication is unjust, for he states in the preface that "Drug addiction is a large problem. A thorough knowledge of it belongs to the future. Enough information, however, is at hand to warrant one in asking for a review of the Narcotic Drug Laws. . . . In the stand taken, the author differs with those who hold that narcotic drug addiction is a menace of such magnitude and imminence as to warrant drastic laws to check it. Statistical data are offered to show that the narcotic drug evil in contrast with that of alcohol is of minor importance."

There is evidence throughout the book that the author finds fault with the disproportionate emphasis being placed on drug addiction as a problem in the United States in comparison with chronic alcoholism. He uses this analogy as the principal theme for "A Square Deal for the Narcotic Drug Addict." The fact that chronic alcoholism constitutes a medicosociological problem of some magnitude that is condoned and neglected without concerted efforts being made to formulate or adopt a public policy for a solution is in itself no justification for "A Square Deal for the Narcotic Addict." The analogy that the so-called menace of narcotic drug addiction has been

exaggerated cannot justify that this medicosociological problem should be condoned in the same manner as chronic alcoholism is condoned, since two wrongs can never make a right.

The author rightly condemns those individuals and groups of individuals who use the so-called drug addiction menace as a means for aggrandizing themselves, bringing themselves into the limelight or using propaganda to promote their political preferment or the collection of funds to combat drug addiction.

The author quotes as an appendix to his book a "Digest of Essential Features Required in a State Narcotic Defense Law," which he calls in his text "The Uniform Narcotic Law."

The Uniform Narcotic Law was recommended by the Commissioners of Uniform State Laws, endorsed by the American Medical Association, the Bureau of Narcotics, the United States Public Health Service, and the American Bar Association. The draft of the Uniform State Narcotic Law was the result of many conferences and studies extending over a period of some five years. Whereas the author presumably leaves the impression that he reviews the narcotic laws, he seems not to have knowledge of the good work that has been undertaken by the Commissioner on Uniform State Laws.

The text is a clerical compilation, with many errors of omission and commission. There is no index.

**Chronic Rheumatism: Causation and Treatment.** By R. Fortescue Fox, M.D., F.R.C.P., F.R.Met.S., President of the International League Against Rheumatism, and J. van Breemen, M.D., Honorary Secretary of the International League Against Rheumatism. Cloth. Price, 12s. 6d. Pp. 364, with 46 illustrations. London: J. & A. Churchill, Ltd., 1934.

The distinguished authors of this book are the president and the secretary of the International League Against Rheumatism, the organization which above all others can claim responsibility for the amazing increase of interest in rheumatic diseases that has been aroused throughout the world during the last ten years. Those familiar with the range of their activities and the breadth of their experiences will expect from these authors not just another book on rheumatism but one different from all others. They will not be disappointed. The title, however, is a little misleading. The scope of the book is not as broad as the title would indicate. Its information is of a more special sort. Its chief concern is the physiologic alterations underlying chronic rheumatism and the rationale of their treatment by physical therapy. The authors stress the great value of physical therapy simply because they believe that, of a large number of forms of treatment which they have used, physical therapy gives by far the best results.

It is unfortunate that physicians in this country utilize physical therapy only meagerly, in spite of the fact that years, even centuries, of experience have shown it to be perhaps the most effective measure in the treatment of chronic rheumatism. American physicians do not prescribe physical therapy because they themselves know so little about its principles and technic, because there are so few trained physical therapists available to help the physician out, or because they somehow hesitate to use a remedy "soiled" by the touch of irregular practitioners. There are available several good books which explain in detail the indications and methods of physical therapy, but the average physician is not interested. There are a number of good clinical handbooks on rheumatic diseases but generally when the author, who is usually a clinician, reaches the chapter on therapy he dismisses the important subject of physical therapy by a few broad if glowing generalities. This book represents one of few examples that bridge the gap between physical therapy books, which the average doctor does not buy, and clinical handbooks on rheumatic diseases, of which there is beginning to be a plethora.

The authors discuss in detail disturbances in circulatory function which they believe underly "the rheumatic diathesis" and are responsible for the first symptoms of rheumatism. The skin is an organ of many functions and is that organ through which physical therapy acts. Whereas the majority of spa physicians, in this country at least, are notable for their inarticulateness and for their willingness to remain content merely with the fact that physical therapy helps the patient without explaining why it helps, the authors of this book go much further. They are not physical therapists but are clinicians who have used physical therapy to its greatest advantage yet have always kept the clinical point of view. Thus they tell so

far as possible why certain kinds and amounts of physical therapy help and why certain others do not. The result is a book that is decidedly clinical and useful for general practice.

On the debit side are certain sins of omission, none the less regrettable because admitted by the authors. Data on pathology and bacteriology and on many current forms of treatment are either omitted entirely or are hardly more than mentioned. Chapter VI discusses various "clinical pictures" that describe various types of chronic rheumatism. Some of the subdivisions of chronic rheumatism mentioned and apparently accepted by the authors as established entities are not generally acceptable to rheumatologists, mainly because the clinical and pathologic bases for them have not been adequately described. The authors do nothing to clarify these underdeveloped pictures, such as "climacteric" or menopausal arthritis, or tuberculous rheumatism. The case reports used to represent such entities are inadequate to make clear why the authors have accepted them.

Certain expressed views are definitely at variance with the opinion of the majority of physicians of even as wide experience as the authors; for example, the declaration that Heberden's nodes, so commonly seen in elderly women, are a definite expression of female gout. Not a few statements are baldly made and have little or no evidence to support them; for example, the assertion that vaccine ought not to be used simultaneously with physical measures or spa treatments, or that rhizomelic spondylosis is definitely of infectious origin, especially gonorrheal and tuberculous. In subsequent printings two changes should certainly be made. References are generously supplied, but their presentation does not conform to standard methods; many, indeed the majority, are incomplete. The year of a book's publication, the city where it was published, the volume number, the year of publication or the pagination of articles frequently is omitted. The index should certainly be amplified; many important topics that are discussed in considerable detail are not listed in the index. Thus the book loses much of its value as a reference work.

Among the most valuable parts of the book are chapters dealing with comparative nomenclature (English, American, German, French), rheumatism as an international social problem of the greatest magnitude, rheumatism in industry, the treatment and prevention of industrial rheumatism, suggestions for the establishment of rheumatism centers and treatment clinics, and suggestions for the development of local and international research. These chapters include data valuable to the physician charged with the executive responsibility of managing an arthritis clinic, a hospital service, a research investigation, or a spa practice for rheumatism patients.

**Transactions of the American Philosophical Society for Promoting Useful Knowledge, Held at Philadelphia. New Series—Volume XXVII: Anatomy of the Rat.** By Eunice Chace Greene. Cloth. Price, \$5. Pp. 370, with 339 illustrations. Philadelphia: The American Philosophical Society, 1935.

The rat is perhaps the animal most commonly used for experimental work at the present time and often by individuals who possess an inadequate knowledge of its structure. This book was designed to serve as "a reference book or atlas for research workers, instructors and advanced students in comparative anatomy." There are approximately 125 pages of text description, the remaining pages carrying the well executed illustrations and captions. Many of the illustrations occupy a full page and more than 180 of them carry one, two or three colors to designate distribution of arteries, veins and nerves among the viscera and muscles. The text as well as the illustrations was executed by the author from personally dissected specimens. Minute anatomic detail for muscles, bones and ligaments of appendages and even digits, as well as individually separated bony elements of the skull indicate the extensiveness of the remarkably clear illustrations. The brain is treated from external gross details and not by brain slices or sections. Microscopic anatomy is not included for any parts. The book is a beautifully executed atlas and will prove a welcome and valuable reference for anatomic details of the rat. It can be recommended to any one interested in or having to do with the details of anatomy of this widely used mammal and is naturally decidedly applicable to the study of anatomy of other small animals.

**Études neurologiques.** Par Georges Guillaín, professeur de clinique des maladies du système nerveux à la Faculté de médecine de Paris. Sixième série. Boards. Price, 80 francs. Pp. 433, with 108 illustrations. Paris: Masson & Cie, 1935.

This book is the sixth of a series written by Guillaín on neurologic studies. He has written in addition five other books on neurologic subjects. All the material of this edition was studied and worked up in the clinic at the Salpêtrière. There are seven chapters. The first is on cerebral tumors and is subdivided into thirteen parts. In this chapter the author discusses tumors in almost every part of the brain. The second chapter deals with pathology of the brain and describes in detail four conditions: astereognosis and trauma to the parietal cortex, atrophic necrosis of the parietal and occipital convolutions, astereognosis (bilateral), and Claude Bernard-Horner syndrome in a case of thalamic syndrome. The third chapter deals with pathologic changes in the cerebral peduncles, pons, medulla oblongata and cerebellum. The fourth chapter is on pathologic conditions in the spinal cord and contains nine subdivisions. The fifth chapter contains a study of certain paralyzes of the external popliteal nerve, meralgia paresthetica and a study of the spinal fluid Lange test in diphtheritic paralysis. The sixth chapter consists of a study of the course in myotonia atrophica. The seventh chapter pleads for the necessity of more scientific research for the further progress of neuropsychiatry. This is an excellent textbook for neuropsychiatrists and neuropathologists.

**An Index of Differential Diagnosis of Main Symptoms.** By Various Writers. Edited by Herbert French, C.V.O., C.B.E., M.D., Consulting Physician to Guy's Hospital. Fifth edition. Leather. Price, \$16. Pp. 1145, with 742 illustrations. Baltimore: William Wood & Company, 1936.

An essential feature of this book is the index, which comprises about 319 pages and has been prepared with meticulous care, so as to include numerous subjects and questions that might arise in making a differential diagnosis. These references in the index, of course, refer to the reading pages in the front of the book, in which the particular symptom or physical sign is discussed with relation to the diseases that may cause it. Another notable feature of the book is the large number of well selected illustrations, of which 196 are colored. Among the nineteen English contributors to the preparation of the book are some names that are well known throughout the civilized world. This book would seem to be especially useful to physicians who are removed from medical libraries or the larger hospitals and who may find themselves with some obscure condition to diagnose. The previous edition of the book was reviewed in *THE JOURNAL*, Jan. 19, 1929. The present edition has been made necessary by the many new diagnostic tests devised since the previous edition was published, by the improvement in the technic of established methods of diagnosis and by the fact that in those few years such diseases as tularemia and psittacosis have become more common. The original purpose of the book was to help in making a correct diagnosis in a case in which one or more symptoms are pronounced and yet the real nature of the disease is not clear. That it serves the purpose well is indicated by the fact that some 53,000 copies of the book have been printed since 1912.

**The Bacteriological Grading of Milk.** By G. S. Wilson, Assisted by R. S. Twigg, R. C. Wright, C. B. Hendry, M. P. Cowell and I. Mafer. Medical Research Council, Special Report Series, No. 206. Boards. Price, 7s. 6d. Pp. 392, with 29 illustrations. London: His Majesty's Stationery Office, 1935.

Bacteriologists, public health officers and others will be interested in this report. It is the result of a comprehensive laboratory investigation on bacteriologic methods for testing and grading milk. The authors were concerned chiefly with providing data for conclusions as to the relative value of current testing methods. They collected considerable evidence which shows—that most American workers are thoroughly cognizant of—that the plate count is subject to considerable experimental error. According to the data presented, an allowance of plus or minus 90 per cent or more may have to be made for any one count. In addition to being inaccurate, the plate count method is complex, expensive and, owing to the practice of

recording insignificant figures, gives a false sense of accuracy. The authors recommend that it be abandoned in the routine examination of raw milks. Other methods of testing milk were examined. The coliform test was judged inadequate. As a simple, inexpensive procedure by which the grading in terms of the content of living bacteria can be reliably performed, a modified methylene blue test is recommended. It is claimed to have only 5 per cent of the variability found with the plate count test. The modification essentially consists of the use of rubber stoppered tubes for the milk and standard methylene blue solution, in place of tubes with cotton plugs. This permits inversion of the tubes at intervals of half an hour. Before being inverted they are examined and the end point is taken when the milk is completely decolorized or decolorized up to within 5 mm. of the surface. The investigators found that the modified technic resulted in a marked diminution in the reduction time of good grades of milk and gave an end point that was easily read.

Comparison of the plate count and modified methylene blue reduction test was made on a large series of different grades of milk. Standards are suggested for grade A and certified milks. The authors point out that only two divisions need be made on the basis of cleanliness; namely, milk that is suitable and milk that is not suitable for human consumption. Laboratory workers may find this volume of additional interest because of the detailed description of technic and the statistical treatment of experimental observations.

**The Hospital Yearbook: A Reference Book on Planning, Equipment, Administration and Purchasing.** Fourteenth edition. Cloth. Price, \$2.50. Pp. 505. Chicago: Modern Hospital Publishing Company, Inc., 1935.

Those who are familiar with this annual publication will find this edition more complete than any previous issue. It is a book of reference for hospital executives. Aside from the condensed and yet comprehensive helps in hospital buying, it covers many features in hospital organization and administration. Several pages are devoted to the purchase of equipment and supplies, covering adequately almost every department. The chapter on organization analyzes the division of work, the jobs and the qualifications of the personnel required for each position. Among the other chapters may be mentioned those on qualifications of the administrator, functions of a women's auxiliary, serving the patient, hospital accidents, budgets, accounting, insurance, decoration and furnishing and food service. The chapter on minimum hospital standards is a collection of the official standards issued by medical organizations, starting with the American College of Surgeons and the American Medical Association and including the requirements of other organizations of standing having to do with the operation of hospitals or parts of hospitals and ending with a comprehensive list of hospital and medical associations. The final chapter is a glossary of hospital terms.

**Semiología radiológica de la aurícula izquierda.** Por Oscar F. Noguera, médico del servicio central de radiología del Hospital Alvarez. Boards. Pp. 87, with 48 illustrations. Buenos Aires: Agencia medica sud-americana, 1935.

The x-rays afford the only means of observing individually the different chambers of the heart and their changes of form and situation and of delineating the different compartments of the heart whatever may be their situation. Borderline cases of difficult diagnosis necessitate the most exact methods, which are correlated with other measurements of the body, such as the procedure of Fray in the left anterior oblique position for the determination of the increase in size of the left and the right ventricle. Verification of the total size in cases of definite cardiac enlargement is of secondary importance. The most important determination is whether the chambers of the heart are hypertrophic or dilated. For this purpose one may have recourse to careful x-ray study in different positions, based on known landmarks, such as the clear retrocardiac space, the angle of bronchial divergence and the esophagus. The radiologic study of the left auricle is of special importance because, in addition to its great clinical interest, it permits recognition of even slight increase in size, a thing that is not possible with other cavities of the heart. The high percentage of cases in which disturbances of the mitral valve figure make even more

important the use of the x-rays. The book is divided into the essentials of topographic anatomy of the left auricle, the radiologic study of the normal left auricle, the mitral configuration of the heart, increase of size of the left auricle, visualization of the esophagus, the angle of divergence and the right bronchovertebral angle, pulmonary venous stasis, radiologic aspects of auricular fibrillation, the left auricle as a mediastinal tumor, and determination of ventricular hypertrophy by the procedure of Fray.

**Surgery: Queen of the Arts and Other Papers and Addresses.** By William D. Haggard, M.D., F.A.C.S., D.C.L., Professor of Clinical Surgery, Vanderbilt University School of Medicine, Nashville, Tennessee. Foreword by William J. Mayo. Cloth. Price, \$5.50. Pp. 389, with 41 illustrations. Philadelphia and London: W. B. Saunders Company, 1935.

This book is a compilation of some thirty addresses selected from a hundred and fifty delivered by the author before various medical and surgical societies in this country, of many of which he has been the president. The scope of the volume is broad. It includes, in addition to sketches of historical development, discussions of the achievements of some of the pioneers in American medicine, eulogies of medical men and surgeons whose names are now famous, lectures on the ideals of medicine as a whole, and a number of scientific papers and clinics on subjects with which the author has become familiar through years of active hospital and private practice. As the addresses were prepared for special occasions, they naturally reflect the mood suitable for the specific purpose. They are sincere, forceful and full of knowledge, wisdom and philosophy, clearly and at times beautifully expressed. Above all they are inspirational and worth reading.

**Chirurgie de l'oreille, du nez, du pharynx et du larynx.** Par Georges Laurens. Avec la collaboration de Maurice Aubry, laryngologiste des hôpitaux de Paris. Third edition. Cloth. Price, 150 francs. Pp. 1,075, with 794 illustrations. Paris: Masson & Cie, 1936.

This is the third completely revised edition of the well known work by Georges Laurens, with the collaboration of Maurice Aubry. After some general statements regarding the operative preparation, anesthesia and hemostasis, the actual surgery of the ear, nose, pharynx, larynx and esophagus is detailed in seven parts, each of which is again subdivided into many chapters. The whole subject has been brought to date, the newer procedures having been incorporated in this new edition. In each instance the various steps in the different operations are given in sequence, and usually with illustrations showing clearly the complete technic. The work is almost encyclopedic in character, is well organized, is written clearly, is profusely illustrated and is most informative. As a text and reference work it will prove of inestimable value to all who are able to read French. But even to those who are not masters of this language, much information might be obtained by simply studying the illustrations, particularly those showing the various steps of the mastoid and laryngeal operations. Without doubt, this volume is a valuable addition to the literature of operative otolaryngology.

**Typebestemmelse ved retsmedicinske pletundersøgelser.** Af Frederik Therkelsen. [Type Determination in Medicolegal Examination of Stains.] Paper. Pp. 158, with 34 illustrations. Copenhagen: Levin & Munksgaard, 1935.

This thesis, submitted for the doctor's degree at the University of Copenhagen, deals with the methods and value of determining the group-specific elements in spots and stains of human blood and semen as well as saliva. From extensive and thorough experimental tests under a great variety of conditions the author has developed efficient methods for the determination of the group-specific substances in such materials. In twenty-four of forty-six examinations in actual instances the type of the blood or seminal spot was determined satisfactorily and in several cases the information thus obtained proved to be of practical medicolegal value. The main results of the extensive investigations, which will interest all who are concerned with type diagnosis for medicolegal purposes, are summarized in German at the end of the dissertation. There can be no question of the desirability of making type determination of stains and spots a regular part of medicolegal laboratory work.

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Accident Insurance: Epidemic Encephalitis as Totally Disabling a Physician**—The Massachusetts Accident Company promised to pay certain weekly benefits to the plaintiff, a physician, if he should suffer a disability from accidental injury or disease which necessarily, wholly and continuously disabled him from the performance of any and every kind of duty pertaining to his occupation. The physician developed epidemic encephalitis, an inflammatory disease of the brain, with Parkinson's syndrome. He had a disturbance of his gait characterized by walking with short steps in a shuffling manner with a propulsion tendency to fall forward. In walking, he held his arms rigidly to his side. He had a marked tremor which involved to some degree his entire body, but more particularly the left arm and leg, the head and tongue. His speech was slurry and indistinct. There was impairment of fine movements as characterized by difficulty in picking up a pin. There was definite impairment of coordinated movements. He had uncontrollable spasms of the eyelids with an associated rolling upward of the eyeballs. There was considerable rigidity of the left arm and leg. At times he had attacks of laughing or crying, which occurred without sufficient provocation. The insurance company paid the specified weekly benefits from June 1933 to Feb 5, 1935, but thereafter stopped further payments. The physician then sued the company for the unpaid benefits, and from a judgment of the trial court for the plaintiff the company appealed to the Supreme Court of New Jersey.

The plaintiff, prior to his disablement, had a large general and obstetric practice, treating approximately 140 patients a week. He was also a surgeon. A neurologist testified "My opinion is that he (plaintiff) is totally incapacitated from carrying on professionally both as a physician and as a surgeon." The company contended that the plaintiff was not totally disabled within the terms of the policy during the period for which benefits were not paid because he had treated some seven patients, gave a hypodermic injection to one patient, wrote about fourteen prescriptions and kept up his offices, which were in his home. The plaintiff admitted that he had treated about four patients a day during that period, but treated only those patients, he said, "which I could handle very easily." The language of an insurance policy, said the Supreme Court, must be construed in a manner most advantageous to the insured without doing violence to the wording. The meaning of the language "any and every kind of duty pertaining to his occupation or business" is "not that he [assured] must be so disabled as to prevent him from doing anything whatsoever pertaining to his occupation, but that, if he be so disabled as to prevent him from doing any and every kind of business pertaining to his occupation, he was entitled to recover." *Gross v Comm Cas Ins Co of Newark, N J*, 90 N J Law, 594, 101 A 169. From the evidence in the present case, the court could find no reason for disturbing the judgment of the trial court for the plaintiff—*Teitelbaum v Massachusetts Accident Co (N J)*, 181 A 395.

**Accident Insurance: Septicemia Following Picking of Intranasal Pimple**—The defendant insurance company insured the deceased against "loss or disability resulting directly, independently and exclusively or all other causes, from bodily injuries effected solely through accidental means." The insured opened a pimple or boil within his nose, with a knife or needle. Inflammation set in at or near the puncture, septicemia followed and the insured died. At the trial of a suit brought by the beneficiary under the policy, there was preponderating evidence to show (1) that the death was produced by staphylococci which were originally confined in the boil or pimple but which, as a result of the insured's act, entered the blood stream, and (2) that it was not usual for septicemia to follow the puncturing or bruising of a boil or pimple. Judgment was entered for the beneficiary, and the insurance company appealed to the Supreme Court of Appeals of Virginia.

The question to be determined, said the Supreme Court of Appeals, is whether or not the injuries resulting in the insured's death were effected by accidental means and fall within the coverage clause of the policy. We think, said the court, that the jury's verdict was based on competent evidence and is conclusive that the insured's death was not the natural or probable consequence of his puncturing the boil or pimple but came about unexpectedly and by chance. There is no proof that he knew that such an act would produce such dire consequences. The court affirmed the judgment for the beneficiary—*Ocean Accident & Guarantee Corporation v Glover (Va)* 182 S E 221.

**Malpractice: Choice of Methods of Treatment**—The patient in this case consulted the defendant, a dentist, for treatment of an abscessed tooth, which the dentist extracted. The infection became generalized and the patient died. The plaintiff as administratrix of the patient's estate, sued the dentist and from a directed verdict against her, she appealed to the Supreme Judicial Court of Massachusetts.

The dentist testified that two methods of treatment were available to him, a palliative one to reduce the inflammation before extracting, and immediate extraction. The former method, he testified, was the usual practice in 1921 when he commenced his practice but since that time the latter method had become recognized as good practice. There was danger in the adoption of either method, he said. There was no evidence of negligence, in the opinion of the Supreme Judicial Court, unless the dentist's decision to extract the infected tooth constituted negligence. Apparently holding that this did not constitute negligence, the court upheld the trial court in directing a verdict for the dentist—*Carlen v Gaw (Mass)*, 198 N E 606.

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to Fellows of the Association and to individual subscribers to THE JOURNAL in continental United States and Canada for a period of three days. Periodicals are available from 1926 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 12 cents if two periodicals are requested). Periodicals published by the American Medical Association are not available for lending but may be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

### American Journal of Cancer, New York

26: 483 702 (March) 1936

- \*Intrathoracic Sympathoblastoma Producing Symptomatology of a Superior Pulmonary Sulcus Tumor (Pancoast) T T Frost and S E Wolpaw, Cleveland—p 483

- Adenoma of Parotid Salivary Gland Onkocyte Tumor G E Gruenfeld and L H Jorstad St Louis—p 571
- Thymoma in Chicken (Gallus Domesticus) W H Feldman Rochester, Minn—p 576
- Absorption of X Rays by Sperm and Erythrocytes and Its Relation to Susceptibility of Tissues to X Rays A Marshak and V L Bollman, Pasadena Calif—p 581
- Tumors of Oral Mucous Membrane C F Geschlechter, Baltimore—p 586
- Relation of the Internist to the Cancer Problem J M Swan, Rochester, N Y—p 608

**Intrathoracic Sympathoblastoma**—Because of the unusual type of tumor, Frost and Wolpaw add a case to the group of cases of superior pulmonary sulcus tumor presenting the clinical features enumerated by Pancoast. Consideration of the gross features of the tumor leads them to presume that the tumor arose external to the lung and extended into it. The tumor in this case fulfils the criteria for a tumor arising from the sympathetic nervous system and the degree of differentiation justifies the diagnosis of sympathoblastoma. It is thought to have arisen from the inferior cervical sympathetic ganglion. No tumors described in the literature have the exact histologic characters of this tumor, because they have occurred in purer form, the sympathogonoma, the sympathoblastoma, the pheochromocytoma and the ganglioneuroma. The situation near the neck is that next in order of frequency to the adrenal. The moderate degree of malignancy is in harmony with the approach to the more mature type of cell. Horner's syndrome and invasion of the brachial plexus with arm pain and muscular weakness were both present. A small, dense homogeneous mass was found at the right apex. Although the available roentgenograms showed no destruction of ribs or spine, their involvement was revealed at necropsy. The necropsy material in the literature is reviewed and indicates that the clinical syndrome which has been described under the name of superior pulmonary sulcus tumor cannot be attributed to a specific pathologic entity but may be caused by various tumors arising near the thoracic inlet.

**Bronchogenic Carcinoma**—Rosedale and McKay declare that in the last ten years 466 cases of malignant disease were examined post mortem at the Buffalo City Hospital, of which

bronchogenic carcinoma constituted 75 per cent. In their district the tumor appears to predominate in people employed in irritating atmospheric conditions. Histologically the tumors consisted of various predominant cell types. Round or spindle cells were found in all cases. The regional lymph nodes were involved in all cases. Clinically the symptoms produced by these tumors closely simulate other diseases of the lungs, such as tuberculosis, pneumoconiosis and bronchiectasis. Roentgenographic study may be of aid in differentiating between the several diseases simulating tumor, but in the presence of secondary pulmonary or pleural pathologic conditions the diagnosis may not be suspected. Bronchoscopy with removal of tissue for microscopic examination is a most valuable procedure. The authors feel, from the study of their material, that bronchogenic carcinoma occurs frequently enough for it to enter the differential diagnosis of all obscure diseases of the chest in persons more than 30 years of age.

**Pyogenic Skin Lesions in Chronic Ulcerative Colitis.**—Jankelson and Massell have seen five patients who, in the course of ulcerative colitis, developed ulcerations of the skin. This complication, though uncommon, is often difficult to control. In one of these cases it was directly responsible for death. The five cases have much in common. All occurred in chronic idiopathic ulcerative colitis during the height of an acute exacerbation. All presented a febrile reaction, toxicity and diarrhea with watery stools containing mucus, blood and pus. The two patients who had an ileostomy showed mucopurulent-sanguineous rectal discharges. In none of these cases could either Barger's organism or *Endamoeba histolytica* be isolated. Bacillary dysentery was excluded by negative cultures and specific agglutination tests. Cultures of smears taken from the base of the ulcers in the sigmoid in three cases yielded various organisms. The organisms were *Staphylococcus aureus*, *Staphylococcus albus* and the hemolytic streptococcus either separately or together, but there is no evidence as to whether these were the primary cause of the lesions or secondary invaders. In two of three cases the same organisms were found in the skin lesions as in the ulcers of the intestinal mucosa. This suggests the possibility of a metastatic origin of the skin infection. A lowered resistance to infection seems

to play an important part in the etiology of these skin ulcerations, whether caused by organisms that get into the skin by direct invasion or carried there by the blood stream from the diseased colon. In instances in which recovery took place, improvement in the skin ulcerations accompanied improvement of the general condition of the patient. The cutaneous lesions varied in severity. In some cases they were merely punched out ulcerations or redness, swelling and induration without abscess formation; in other cases there were multiple distinct abscesses. The amount of colon involved does not seem to bear any relation to the severity of the cutaneous infection. The early lesions often resemble toxic diseases of the skin. Their course, however, is not typical and in most cases pyogenic infection occurs. The treatment of the pyogenic infections of the skin in the course of an ulcerative colitis is largely symptomatic: incision and drainage of single abscesses, heat—dry or moist—in the punched-out ulcerations. In the one case in which autogenous vaccine was tried, the results were apparently excellent. Whatever management will cause a remission of the chronic ulcerative colitis will contribute to the healing of the pyogenic infection of the skin.

**Permeability to Egg Albumin in Peptic Ulcer.**—Marks declares that individuals without gross lesions in the mucosa of the upper portions of the alimentary tract do not give the egg white precipitin test in the urine, excepting in 20 per cent of cases that might possibly be considered to have given a false positive result. Patients with active peptic ulcers, whether located in the stomach or the duodenum, have yielded the precipitin reaction in 75 per cent of the cases. This might be considered to introduce a possibility of a 25 per cent false negative reaction. All but 20 per cent of patients with healed peptic ulcer gave a negative reaction. In spite of the possibility of false positive and false negative reactions in a certain proportion of cases, it seems that the test may be of value as corroborative evidence of the probable presence or absence of active peptic ulcer or other lesions of the mucous membrane in the upper portion of the digestive tract, and in differentiation from gallbladder and other diseases producing similar clinical pictures.

Further Studies of Viosterol in Prophylaxis of Rickets in Premature Infants. L. T. Davidson and Katharine K. Merritt, New York, and S. S. Chipman, Norwalk, Conn.—p. 594.

**Lung Volume During Treatment with Artificial Pneumothorax for Pneumonia.**—Lindskog and his co-workers observed the volume of the lungs in its component parts in three cases. A comparison of the initial determinations of the subtidal volume of the lungs and the final values recorded during the convalescence indicates that the subtidal volume is considerably reduced during the early stages of lobar pneumonia. In case 1, although the initial roentgenogram showed little evidence of infiltration, the reduction in subtidal volume was 20 per cent. There was also a significant reduction in the mean tidal exchange, this being in association with an accelerated respiratory rate. The introduction of measured amounts of air into one pleural space was followed by a decrease in the subtidal volume of the lungs, but less quantitatively than the volume of air introduced. Likewise the withdrawal of air in measured quantities from an existing pneumothorax caused

a rise in the subtidal volume, but less than the amount of air withdrawn. When large volumes of air are introduced into the pleural cavity, there is an increase in the size of the chest, which can be demonstrated physically and by roentgen measurements. There is also a drop in the level of the diaphragm toward the inspiratory position. Shifts in the mediastinum and pleural adhesions may be complicating factors. A redistribution of the volume of blood in the pulmonary fields and the large venous reservoirs of the mediastinum must likewise be considered. The physiologic adjustments following the introduction of large volumes of air into the thorax act in a direction to preserve a subtidal (functional residual) volume sufficient to the needs of the patient at the expense of the complementary air, which is drastically reduced.

**Changes in Rate of Fetal Heart.**—Sontag and Wallace made 217 experiments between one day and 127 days before delivery on eight pregnant women; there was an average increase of  $11.2 \pm 0.47$  beats per minute in the fetal heart rate following the application to the mother's abdomen of vibratory stimuli of a frequency of 120 beats per second. This change in heart rate was distributed according to months. It was increased from an unreliable decrease of  $0.07 \pm 1.52$  beats per minute during the fifth month before birth to an average increase of  $14.3 \pm 0.74$  beats per minute during the last month before birth. This increase was greater than the increase due to fetal movement. There were two cases, representing seventy-nine experiments, in which no movement response to the stimulus occurred, but in which a reliable increase in heart rate did occur. There is a total of fifty-seven experiments in which no movement occurred during the first minute following stimulation. The fetal heart rate underwent an average increase of  $6 \pm 1.11$  beats per minute. This response may prove of value as an index of intra-uterine development.

Immunity to Virus Myxomatosis as Affected by Port of Entry. R. R. Hyde, Baltimore—p 425

**Experimental Infections with *Endamoeba Histolytica*.**—Atchley inoculated strains of *Endamoeba histolytica* by mouth from the wild rat and from man into laboratory rats. Almost 50 per cent of the inoculations of wild rat material were successful, eight of seventeen rats being positive later. Only 13 per cent (four of thirty) of the rodents given the amoeba from human carriers became infected. Cysts (human material) were observed in only one experimental animal and then at examination one month following inoculation. As a result of repeated attempts to infect twelve young wild rats

raised in the laboratory, one light infection was obtained. One very light colonization was observed subsequent to attempts to inoculate six laboratory rats intracably with *Endamoeba histolytica* trophozoites from cultures. No symptoms and no pathologic changes were observed in any case, either in four naturally infected wild rats (tissue sections) or during the experimental work. Of six kittens inoculated with the ameba from the wild rat, two became positive, although *Endamoeba histolytica* was not demonstrated microscopically within the tissues.

**Effect of Liver Extract on Intestine of Patients with Sprue.**—Miller and Rhoads observed that flatulence, intestinal discomfort, cramps and diarrhea recurred in patients having had sprue unless a sufficiently large amount of liver extract was administered at frequent intervals. This was the case despite the fact that no detectable hematologic disturbance was present. Thus the intestinal dysfunction rather than the anemia has been the guide for the administration of therapy. The fact that the amount of liver extract necessary to prevent recurrence of intestinal dysfunction was far greater than that necessary to maintain normal blood levels suggested that a relationship existed between liver extract and intestinal activity. The results of the roentgenologic study of an individual case furnish unequivocal evidence of the specificity of liver extract therapy of the intestinal manifestations of sprue without anemia.

**Sickle Cell Anemia as Cause of Cor Pulmonale.**—Although many patients with sickle cell anemia die at a relatively early age of some intercurrent infection, particularly pneumonia and tuberculosis, some die apparently of the anemia itself. Yater and Hansmann believe that cardiac failure is often a part of the terminal picture. Their experience with two cases leads them to believe that there is something other than the severe anemia producing the cardiac failure; namely, hypertension of the lesser circulation due to numerous occlusions of the medium size and small pulmonary arteries with subsequent hypertrophy and failure of the right side of the heart. In one case the heart failure was acute and manifested by orthopnea, great enlargement of the liver and dilatation of the heart. In the other, heart failure was not suspected clinically because of absence of orthopnea, but the liver became greatly swollen. The cause of the right heart strain in the first case was thrombotic occlusions of the small and medium size arteries of the lungs, with organization and canalization of discrete thrombi, which had formed from time to time. The heart failure was apparently precipitated by a final crop of fresh thromboses. The cause of the right heart failure in the second case was thickening of the walls of the small and medium size arteries and the arterioles of the lungs with reduction in their lumens, but thromboses were not present in the tissue studied. Right heart failure due to vascular changes in the lungs must be common in cases of sickle cell anemia,

since many of the patients have enlarged hearts, systolic murmurs and hepatomegaly. Capillary stasis due to distortion and agglutination of erythrocytes is probably the essential factor in the changes described in the small arteries. Changes in the nervous system are described in the first case, among which are the same lesions in the choroid plexus as are seen in the spleen in cases of advanced sickle cell anemia. The changes in the bone marrow differed from those previously reported in that they also were similar to those observed in the spleen.

**Insulin and Diabetic Patients with Coronary Sclerosis.**—The observations of Collens and his associates are not in accord with the clinical reports of Parsonnet and Hyman, who have indicated that anginal symptoms are frequently aggravated in the insulin-treated cases even when the blood sugars are normal. They feel that harm has been done by introducing the concept that insulin has a deleterious effect on the heart of the elderly diabetic patient. It is the hypoglycemic attack which is fraught with danger, but, if it is possible to obviate the toxic effect of this hormone, it should not be discarded as dangerous. Insulin is a double-edged sword: given in therapeutic doses it produces remarkable therapeutic effects; given in toxic doses it can even kill. Methods for adequately protecting patients against the toxic effects of insulin are presented. Insulin has been found to have a remarkable therapeutic value for the relief of cardiac pain of the diabetic patient. It would be of considerably greater importance to determine the sugar content of the blood three and four hours after insulin has been injected in order to decide whether the patient is hypoglycemic. It is the lack of this type of observation that has led to what the authors consider false conclusions.

- \*The Brains of Infants and Children in Relation to Postmortem Time, Toxicity and Convulsive State. C. R. Tuthill, Staten Island, N. Y.—p. 269.

**Subclinical Adenoma of Pituitary Gland.**—Costello bases his remarks on the study of 1,000 pituitary glands obtained over a period of years in the course of routine postmortem examinations. Of the glands examined, 225 were found to contain one or more adenomas. In 224 of these glands, excluding one with multiple adenomas, there were found to be 265 adenomas. These adenomas were classified as follows: chromophobic, 140; eosinophilic, twenty; basophilic, seventy-two, and mixed types, thirty-three. In an endeavor to find the age group in which adenomas occurred most frequently, the ages of subjects with adenomas were plotted against the age curve for the 1,000 subjects in the whole series. The youngest subject in whom adenomas were found was 2 years old; the oldest was 86 years old. The greatest incidence of adenomas occurred in the sixth decade of life. Of the 225 patients in whom adenomas were found, 148 were male and seventy-seven were female. Since the proportion of males to females in the 1,000 cases was 63 to 37 per cent, it can be seen that the incidence in the two sexes is about equal. The clinical diagnoses and causes of death in the 1,000 cases ranged through almost the entire list of medical and surgical conditions. In the 225 cases in which adenomas were found, the same variability in clinical observations and causes of death was apparent. There was nothing in the history or clinical observations in any case in which an adenoma was found to suggest the presence of any

pituitary dysfunction. This is startling, since in a few cases the adenomas were so large as almost to destroy the gland. Apparently, however, there was sufficient normal tissue remaining to sustain normal pituitary function. This would justify the term "subclinical adenoma" as applied to them. It is possible, however, that under the influence of an unknown stimulus some of these adenomas may secrete a hormone or similar substance capable of producing symptoms.

**Study of Brains of Children.**—Tuthill examined the brains of thirty-four children from 12 days to 4 years of age who died from the usual diseases of childhood. Brains from cases of acute infections, second degree burns, allergy and lead poisoning did not show changes in the ganglionic cells that could be attributed to toxicity. The loss of cytoplasm and the density of its stain, the tingeing of the nerve tissue, the hyperchromatosis of the nuclei and the perivascular spaces varied somewhat with age and the fixative, but chiefly with the post-mortem time. The indications of toxic injury were found rather in the reactions of the microglia and the macroglia. The most severe and frequent lesions in the brains were those produced by the vascular disturbances of the convulsive state that accompany many diseases of infancy and young childhood.

#### Etiology of Abdominal Pain in Diabetic Acidosis.

Walker declares that the usual signs, symptoms and laboratory observations in prediabetic coma are well known, but the picture is occasionally complicated by symptoms and signs referable to the abdomen which may make it difficult or impossible to determine whether the patient has an intra-abdominal surgical lesion or whether the symptom complex from which the patient is suffering is due entirely to acidosis. A case of this complex syndrome is cited. A differential diagnosis cannot be made without making qualifications. McKittrick states that these patients before operation always suggested some widespread abdominal pathologic process as the cause of the abdominal pain. In diabetic coma, vomiting usually precedes pain, while in precoma cases with surgical complications pain usually precedes vomiting—particularly in acute appendicitis. When appropriate therapy is applied, the signs and symptoms due to acidosis clear up promptly, while, of course, the signs and symptoms in the surgical cases will usually progress. Differentiation is not always possible and, when the patient does not respond in a reasonable length of time, an exploratory laparotomy should be done. In the author's case vomiting preceded the pain by several hours; the patient received insulin in large

amounts before entering the hospital, yet in an insufficient quantity to control the acidosis; prompt relief followed the administration of a small quantity of physiologic solution of sodium chloride, and the patient continued to show evidence of acidosis after the pain had subsided. These facts suggest that acidosis was not solely responsible for the symptoms, since, when measured by laboratory means, there was no reduction. The history suggests too that insulin was certainly not the sole factor in controlling the symptoms, but rather that the saline solution was responsible for the relief of symptoms. When clinical conditions, such as heat cramps and "gastric tetany," are considered, the connection seems even more probable. The author suggests that the events producing abdominal symptoms in diabetic acidosis probably develop in the following order: 1. Because of improper fat oxidation, acidosis develops; the acidosis in susceptible patients causes vomiting; the acidosis not being controlled, the vomiting continues. 2. The continuous vomiting depletes the body of chlorides because of loss of hydrochloric acid. The excessive diuresis would produce further chloride loss. 3. In the exercise of abdominal muscles and muscles of respiration, there is brought about a condition in these muscles similar to that which is present in heat cramps and gastric tetany; hence the pain, and hence the relief by sodium chloride.

**Blackwater Fever.**—Fernán-Núñez believes that blackwater fever is an allergic manifestation of malaria in which quinine, exposure and other resistance-reducing agencies aid in precipitating the attack. It occurs chiefly in Europeans who have had one or more attacks of estivo-autumnal fever during a residence usually of at least two years in the tropics. In such a person sensitized by previous attacks a new attack of estivo-autumnal malaria or the administration of quinine in a latent case brings on the acute syndrome by the liberation of allergens. The author applied his intradermal test with suspensions of *Plasmodium falciparum* rendered noninfective in a group of persons of Caucasian extraction who had resided in an endemic area of Colombia for more than six months. Following the removal of those showing a positive sensitivity, blackwater fever disappeared from that area.

**Treatment of Narcolepsy with Benzedrine Sulfate.**—Ulrich and his associates found that the inhalation of benzedrine (synthetic racemic benzyl-methyl carbinaminè) for the relief of nasal congestion was followed by sleeplessness, an experience that suggested the use of this method in the treatment of narcolepsy. Clinical trial showed, however, that inhalation of the drug produced very slight results, whereas oral medication was uniformly successful in preventing narcoleptic seizures. Six cases of narcolepsy, showing marked relief, have been treated by them and form the basis of their discussion. Prinzmetal and Bloomberg also found oral treatment with benzedrine to give complete relief in nearly all their cases. The effective daily amount of drug varied from 20 to 50 mg. It appears that the difference between inhalation and ingestion is quantitative. One patient complained of slight nausea at the beginning of oral medication, another's gastro-intestinal symptoms were aggravated during the first period of treatment but not subsequently, and a third had slight temporary anorexia at the beginning of each period of treatment. One patient, a Negro girl aged 12½ years, had an additional menstrual period while taking 50 mg. of the drug and has complained recently of a slight feeling of fullness at mealtime.

**Lactogenic Substance in Human Breast.**—Geschickter and Lewis produced mammary secretion in three of sixteen non-pregnant menstruating women by intramuscular administration of estrogen and of lactogenic substance, which had no effect in eight and lactogenic substance alone had no effect in the remaining five. In the three women in whom mammary secretion was observed, a diagnosis of adenosis of the breast was made. Each received about 3,500 units of estrogen over a period of a month, followed by injections of from 600 to 1,120 bird units of lactogenic substance given within a week. The secretion ceased within a period of three days and could not be prolonged by further injections or by mechanical stimulation. Histologic studies of tissue removed for biopsy were made before and after the injections in several cases. The changes of true functional lactation were not observed histologically. Bio-assays showed the presence of lactogenic substance in the tissue of udders from lactating cows and in the milk (mixed with colostrum) of lactating cows obtained within two weeks of calving. It was concluded that high concentrations of estrogen, of lactogenic substance and of progesterin are probably essential to normal lactation in the human breast. The resemblance between the secretory activity seen in patients with chronic cystic mastitis and that obtained in the patients treated in this series is pointed out. Bio-assays have demonstrated the presence of estrogen and of lactogenic substance in the cyst fluid from patients with chronic cystic mastitis. Bio-assays have also shown the presence of estrogen in mammary tissue removed from patients with chronic cystic mastitis. It is concluded that lactogenic substance and estrogen assume an etiologic rôle in the secretory activity and in the pathologic changes observed in patients with cystic disease.

**Malignant Degeneration of a Bone Cyst.**—Francisco and his co-workers cite a case of what they believe to be a malignant change in a benign bone cyst. The child, when 9 months old, slipped and fell, receiving a definite injury to the leg. Conservative treatment was tried for six months but had no effect in lessening the pain. When she was 15 months old, roentgenograms were taken and a diagnosis of sarcoma was made. Roentgen treatment had no effect in controlling the pain, which caused the parents to seek further help. No definite deformity was described at that time. The child was approximately 3 years old when she was first seen by one of the authors (Francisco), at which time no gross deformity was

noted. Anteroposterior and lateral roentgenograms of the right tibia, taken April 4, 1928, showed a multilocular cystic appearance of the upper end of the tibia. This began at or below the metaphyseal end of the diaphysis and did not extend upward at all, so that the lesion did not affect the epiphyseal line. Areas of sclerosis were seen already lining some of the cystic cavities. The area of involvement extended downward for about one third or less of the length of the shaft of the bone. June 25, 1930, roentgenograms showed almost complete obliteration of the cystic cavities, with much condensation of the bone. At that time the patient was discharged by Francisco as cured of the bone cyst. No further trouble was encountered until the present illness, which began Dec. 18, 1934, with the complaint of pain and swelling in the upper part of the right leg. December 20 a simple exploration was performed. Macroscopically the tissues resembled sarcomatous tissue rather than granulation or cystic tissue. The roentgenologist stated that, if the clinical and pathologic diagnosis was osteogenic sarcoma, the roentgenogram could be well interpreted as showing osteogenic sarcoma. The final diagnosis was osteogenic sarcoma, and immediate amputation to be followed by irradiation was advised. The amputation was performed in the upper part of the thigh at the junction of the upper with the middle third, leaving just enough stump to control an artificial leg. The patient did exceptionally well after the amputation and has made a remarkable personal change. She received her first course of roentgen therapy and is to return for further irradiation under the supervision of the radiologist. The tumor tissue was found to be made up chiefly of large capsulated cells, which had the characteristics of hyaline cartilage cells. The pathologic diagnosis was chondrosarcoma of the tibia originating from the metaphysis and extending to the diaphysis of the bone.

**Metabolic Studies of Pituitary Insufficiency.**—The studies of Bulger and Barr relate to the activity of pituitary and certain other extracts on metabolic processes. They were made on four patients with marked endocrine abnormalities in which the pituitary was possibly primarily involved. Two

patients considered to have respectively pituitary cachexia and pituitary dwarfism showed a definite gain in weight, improvement in their general condition and marked storage of nitrogen, sulfur, calcium and phosphorus without specific treatment. There seemed to be no cause for this except an adequate attractive diet, rest and good nursing care. In a case considered to be pituitary cachexia, magnesium was lost during control periods of study while rather large amounts of other elements were stored. In the case of pituitary dwarfism, magnesium as well as other elements was retained. The administration of adrenal cortex extract in pituitary cachexia was associated with a temporary rise in blood pressure, reversion of a negative magnesium balance to a positive balance and increased retention of calcium. When the extract was discontinued, this was followed by an increased excretion of magnesium, calcium and phosphorus. The administration of anterior pituitary-like substance from pregnancy urine to a patient with pituitary cachexia for seven days caused a prolonged rise in blood pressure, an increase in the negative magnesium balance and retention of magnesium. Growth hormone produced no striking changes in pituitary cachexia or pituitary dwarfism. A patient with pituitary cachexia, while receiving thyrotropic hormone, became quite ill. The basal metabolic rate rose to normal. A loss of nitrogen, phosphorus and sulfur ensued and calcium retention decreased. A negative magnesium balance of control periods reverted to a positive balance. Creatinuria developed though the basal metabolic rate did not rise above normal. While the patient was receiving the thyrotropic hormone and still quite ill, adrenal cortex extract appeared to cause some improvement and was associated with a rise in blood pressure. The patient with pituitary dwarfism also became ill on thyrotropic hormone. The basal metabolic rate at first rose slightly and then fell to below the original level. He developed a negative nitrogen and sulfur balance. The previous positive magnesium balance reverted to a negative balance. Creatinuria increased. Starting on the seventeenth day, while still receiving thyrotropic hormone, he was given iodine. Coincident with this the basal metabolic rate fell still lower and he began to store all the elements studied. A patient with myxedema and evidence of pituitary disease showed no change in basal metabolic rate or nitrogen metabolism on thyrotropic hormone. Desiccated thyroid, however, produced a typical response with a negative nitrogen balance and marked creatinuria even though the basal metabolic rate did not rise above normal.

**Cachexia Hypophyseopriva with Thyroid and Adrenal Insufficiency.**—Rose and Weinstein cite a case of pituitary cachexia, verified by necropsy. From the histologic appearance alone it could not be determined definitely whether the pituitary, thyroid or adrenal changes initiated the patient's disease. However, the clinical history conforms well with that of primary pituitary cachexia, and it may be reasonably assumed that this was not a case of multiple synchronous endocrine sclerosis of the Falta type. The marked hypoglycemia and increased dextrose tolerance, the terminal coma, hemoconcentration, azotemia and hypotension all suggest a terminal adrenal failure as the immediate cause of death. The high fever is rather difficult to explain, although terminal hyperpyrexia occurs in pituitary neoplasms; a terminal septicemia might have been responsible. The return of the basal metabolism to normal under thyroid therapy in 1931 suggests that its original low level was due to secondary thyroid failure rather than directly to anterior pituitary insufficiency. The hypercholesterolemia was probably also due to secondary thyroid failure. The dense round cell infiltration of the thyroid suggested an associated inflammatory process in addition to the atrophy, fibrosis and disorganization. Death occurred before cachexia had become marked. The hemorrhagic spongy appearance of the gums suggested a possible scorbutic factor associated, perhaps, both with dietary deficiency and inability to utilize available cevitamic acid because of adrenal insufficiency. Finally, the correct diagnosis should have been made or suspected when the patient was first seen in 1931, as the history and signs were fairly typical at that time. At necropsy marked atrophy, fibrosis and destruction of normal architecture were noted in the anterior pituitary, adrenal cortices and thyroid. The posterior pituitary and pancreas were not affected.

**Studies on Virus of Influenza.**—Dochez and his associates report the experiments that they have performed with the virus of influenza from 1931 to 1935. Evidence is presented indicating the presence of a filtrable virus in the nasopharyngeal secretions of individuals suffering from influenza. An attempt to transfer influenza from one human being to another by means of filtered nasopharyngeal washings resulted in the production in the inoculated volunteer of a common cold. A filtrable agent has been cultivated in tissue medium from the filtered nasopharyngeal washings of patients with influenza. Inoculation of the cultivated virus into volunteers results for the most part in the production of a severe common cold with a tendency to pronounced constitutional reaction. In one instance following inoculation of culture virus an infection clinically resembling influenza has been produced. The more closely the source of the virus approached the type of epidemic influenza, the more likely the virus was to provoke constitutional symptoms. The presence of certain pathogenic bacteria in the upper respiratory tract of inoculated individuals was not observed to modify the course or character of the experimental infection. On prolonged cultivation the virus loses the capacity to infect human volunteers.

**Vaginal Ureterolithotomy.**—Shaw employed the lateral incision directly over the ureter in his four vaginal ureterolithotomy operations and found this simple method satisfactory. A description of the operation is given. In two cases the operation seemed to be almost life saving, as he does not believe that either patient could have stood the removal of the calculus by any other approach at the time. The accidental production of vesicovaginal fistula in his first case illustrates a possible operative complication that has not been stressed in the literature. If the operator keeps the relationship of the base of the bladder, cervix and ureter in mind, this accident should never occur. The bladder can be readily avoided by inclining the dissecting finger laterally and posteriorly and approaching the ureter on its lateral and posterior aspect. The selection of cases for the employment of vaginal ureterolithotomy may well give rise to some difference of opinion. Obviously, impacted stones, readily palpable on vaginal examination, fall into this group. It is quite probable that calculi so small or so high as not to be palpable, but demonstrated roentgenographically in the lower ureter and fixed with a ureteral catheter, may be handled by this approach. The failure of an attempt to remove the calculus by the vaginal route would do the patient little harm and it might be tried even in doubtful cases before the more serious abdominal operation is employed. The author is in accord with the conclusions reached by Lower in listing the advantages of vaginal ureterolithotomy. The operation carries so slight a degree of shock that it may be performed with relative safety on extremely ill patients.

**Carcinoma of Prostate Simulating Malignant Condition of Rectum.**—During the last three years Kickham encountered four cases of carcinoma of the prostate that were unusual in their extension and clinical behavior. The predominant symptoms were referred to the rectum and consisted of intractable constipation, tenesmus, mucus discharge at the anus, fecal incontinence and, in one instance, rectal bleeding. Symptoms referable to the genito-urinary tract were either absent or, if present, were mild in character. On digital examination the appearance of the rectum closely simulated a malignant rectal disorder. The final clinical diagnoses were made only after special diagnostic measures, including proctoscopy, cystoscopy and roentgenologic studies. In view of the anatomic approximation of the rectum and the prostate gland, it would seem logical to encounter rectal symptoms frequently in the development and course of a malignant condition of the prostate, due either to actual invasion of the rectal wall by the tumor

cells or to constriction of its lumen by the bulging mass of the tumor. However, this does not take place as often as one would expect, apparently because of nature's line of defense—Denonvilliers' fascia lying between the two organs and acting as a barrier against posterior invasion of the neoplasm. However, actual rectal extension from carcinoma of the prostate may occur, as this fascia is not impervious to invasion by tumor cells. It is at times disclosed at postmortem examination when clinical signs have not suggested it. In more than 200 cases of carcinoma of the prostate at the Pondville Hospital, no fistulas were encountered clinically. The author feels that it is most unusual to find carcinoma of the prostate gland simulating a malignant condition of the rectum so closely as in the four cases described.

**Temporary Insulin Resistance.**—Blaisdell reports the case of an elderly man with diabetes who entered the hospital for treatment of a ruptured quadriceps muscle and was standardized with 45 units of insulin daily but developed a prostatic obstruction and temporary resistance to insulin. At the height of the resistance, 289 units was given daily in the absence of acidosis. During the period of the resistance (twenty-nine days) he was given 5,692 units of insulin. A transurethral prostatectomy, performed shortly after the period of resistance, had no appreciable effect on the insulin requirement and, six months later, the daily requirement was only 10 units. It is difficult to explain the sudden increase in insulin requirement. It hardly can be ascribed to the prostatic obstruction, as diabetic patients with prostatic obstruction rarely require more than a moderate increase, if any, in insulin during the period of obstruction. Examination failed to disclose any evidence of infection at the onset of the resistance. The patient did have a rise of temperature for a few days, but this did not develop until two weeks after it was necessary to increase the insulin. The most probable explanation was the possibility of a posterior urethral infection or a prostatic abscess, but the absence of pus in the urine makes one somewhat skeptical of this diagnosis. It is fair to assume, however, that failure to control the diabetes with adequate doses of insulin would have resulted in death.

**Artificial Pneumothorax in Lobar Pneumonia.**—In their observations on the therapeutic effects of artificial pneumothorax in forty-two cases of lobar pneumonia, Blake and his co-workers place emphasis on the method of treatment evolved during the course of the study and on the effect of artificial pneumothorax on the clinical course and outcome of the disease in an effort to define tentatively the conditions under which artificial pneu-

mothorax would appear to be therapeutically useful. The results obtained indicate that the procedure is of definite therapeutic value, but only under certain limited conditions: 1. When the volume of air introduced into the pleural cavity is sufficient to raise the mean intrapleural pressure promptly to from +1 to +2 cm. with the patient in the lateral position, pneumonic side up, resulting in complete collapse and immobilization of the lung on the affected side. 2. When the frequency and volume of refills is sufficient to maintain the mean pressure at this level and the lung retracted until danger of relapse is past. 3. When treatment is instituted early in the disease; i. e., certainly within less than seventy-two hours after onset, probably within less than forty-eight hours in most cases. 4. When the pleura is free from adhesions that interfere with retraction of the involved lung. The series includes ten cases without interfering pleural adhesions in which treatment was started prior to forty-eight hours after onset. Artificial pneumothorax seemed of little or no therapeutic value in advanced cases of more than seventy-two hours' duration and in even earlier cases with extensive pleural adhesions. In the intermediate group first treated between forty-eight and seventy-two hours after onset, the results remain of doubtful significance in view of the early appearance of agglutinins in three of the six cases without adhesions, and the occurrence of relapse after initial improvement in two of the remaining three cases.

Bronchoscopy: Diagnostic Aid. J. S. Knight, Kansas City.—p. 144.

**Significance of Convulsions in Diagnosis of Brain Tumor.**—Sachs and Furlow believe that every adult patient who has a convulsion must be considered as possibly having a tumor until proved otherwise. In a review of 724 cases of verified tumors 150, or 20.7 per cent, had convulsions at some time before operation. In this series, 397 patients had cerebral tumors, 247 had cerebellar tumors and seventy-nine had pituitary tumors. None of the patients with pituitary tumors had convulsions. Only twelve, or 4.8 per cent of the patients with cerebellar tumors had convulsions, while 138 of the 397 with cerebral tumors, or 34.8 per cent, had convulsions. In other words, more than one third of all the patients with cerebral tumors had convulsions either as the first symptom or at some time in the course of the disease. Of the 150 patients who had convulsions, twenty-seven had them for periods ranging from five to twenty-five years before the diagnosis of tumor was finally made. These patients had benign, slowly growing tumors and should have presented an excellent prognosis. Owing to the fact, however, that the tumor had been present such a long time, permanent irreparable damage had occurred frequently and the tumor had attained such great size that what might have been a comparatively simple operation in the early years had become a most difficult one.

**Parathyroids in Relation to Chronic Arthritis.**—Wootton's interpretation is that the bone deformity called arthritis is merely one symptom, although the one most frequently seen, of the shifting location of the lime salts making up our skeletal framework and blood serum content. Therefore, one may consider chronic arthritis as one of the stages of calcium metabolism and dependent completely on there being a concomitant edema (allergy) of the synovia. If one can prevent the original edema one can first prevent the occurrence of acute arthritis and secondly remove the primary essential to all

chronic changes of the joint other than the purely mechanical. Without an edema of the synovia or periosteum of a joint the protection remains impervious to either an absorption or a redeposit of calcium within a joint. Oppel, Ballin and Morse report encouraging results from the removal of a parathyroid. Oppel says that pain and stiffness were relieved almost at once. The beneficial influence of parathyroidectomy on pain and stiffness of the spine was marked in all cases. Merritt reports improvement by irradiation of the parathyroids in his cases of hypercalcemia producing cystic degeneration of the long bones and vertebrae. Schkurov reports 116 cases of chronic polyarthritis and spondylarthritis in which only eight patients failed to get relief from pain and swelling and have restored a considerable degree of mobility following parathyroidectomy. Schkurov gives Oppel the credit for establishing the rationale of the procedure. As surgical intervention is apparently still in the experimental stage in this country and abroad and roentgen atrophy of the glands has not proved uniformly encouraging, the only other route of attack lies in the prevention of allergic reaction in the synovia against allergens from foci of infection and protein foods. Undoubtedly there will be times when a hyperplastic gland may be suspected or an adenoma may be removed. But these occurrences will be so few compared to the irregular and transitory overstimulation of the parathyroids that may occur from numerous causes that they will prove exceptional. And always one will be faced with the problem of whether the hyperparathyroidism is mechanical as the result of hyperplasia or adenoma due to endocrine influence or automatically induced by hyperphosphatemia not causally related to the endocrine system.

**Erythrocyte Sedimentation Rate in Psychiatric Cases.**—According to Gregory, the erythrocyte sedimentation rate determination, based on the study of blood specimens (oxalated) from 1,102 newly admitted patients to the Binghamton State Hospital over a period of three years, seems to permit the following conclusions: 1. It is not diagnostic of any particular psychotic group. 2. It is a valuable diagnostic and prognostic aid in evaluating organic pathologic changes in all types of mental cases, often revealing the presence of previously unsuspected disease and giving an indication for further physical diagnostic studies. 3. Higher rates were obtained in the group of organic than in the group of functional psychoses because of the more frequent occurrence of inflammations, new growths, tissue degenerations, and so on. 4. The test is sensitive to acute respiratory infections, including the common cold, and to immunization inoculations, which must be ruled out in

searching for an underlying pathologic condition. 5. Potassium oxalate is a satisfactory anticoagulant, making it possible to apply the test with oxalated blood specimens sent to the laboratory for other types of examinations. 6. The technic is so simple as to make the test a boon to the private practitioner as well as to the hospital pathologist.

**Application of Anatomy and Physiology of Hypothalamus.**—Vonderahe states that accumulating clinical and pathologic data indicate that the pituitary body cannot be considered apart from the contiguous portion of the central nervous system; i. e., hypothalamus. All cases suggesting the traditional symptomatology of pituitary disease, therefore, require investigation into possible central neurologic mechanisms involved in the production of these phenomena. The central domination of the metabolic function, temperature regulation, sleep and the sympathetic and parasympathetic systems suggests that the complete understanding of metabolic disease as presented to the internist requires inclusion of a consideration of these central visceral centers. The various trophic disturbances of the skin presented to the dermatologist and the trophic disturbance of bones presented to the orthopedist similarly require understanding of this area for the adequate explanation of many of the cases. For the pharmacologist it appears most probable that hidden away in this central area of the brain, difficult of access by surgery, are cellular centers capable of highly selective and specific responses to drugs. The area is of special interest to the psychiatrist. If the psychiatrist insists on an organic foundation for psychoses, here is the area in which biochemistry and neurology meet to offer a basis for a physical foundation for behavior; if the psychiatrist finds the answer to his problems in purely conscious mechanism, here is the necessary anatomic substratum for his theories; if he does not wish to commit himself to either extreme, the anatomic and physiologic data here presented permit him to interpret his observations with a suitable balanced attitude.

**Complement Fixation Test in Gonorrheal Infection.**—The Hirshlands studied 545 gonococcus complement fixation tests performed on the serum of 227 female patients under controlled conditions in a quarantine station. In interpreting the reports of the complement fixation tests, a test is considered positive if it shows slight inhibition (plus-minus) to complete inhibition of hemolysis (plus 4). A repeated weakly positive reaction is regarded as specific as a strongly positive reaction.

Many cases in the series proved this. The degree of positivity varied with the clinical picture, a plus-minus often occurring in the early stages of a severe infection, at the height of a mild infection, or just before the complement fixation test became negative. Vaginal smears were obtained for examination from the urethra and cervix. It was found that the complement fixation test is of great value in cases of chronic gonorrhea in confirming the clinical diagnosis of gonorrhea or in eliminating its presence. It is of little value in the diagnosis of acute or subacute gonorrhea, with these exceptions: A persistent negative reaction throughout the convalescence indicates a good prognosis, often a cure; on the contrary, a positive test indicates complications and trouble ahead. The complement fixation test for gonococci is valuable in distinguishing between gonorrheal and syphilitic lesions. It is of valuable aid in doubtful diagnosis of chronic lesions, especially when, as in this series, little honest information can be obtained from the patient.

**Purification of Antidysenteric Serum with Sodium Sulfate.**—Garcia and his associates employed a slight modification of the method used by Brunner and Pinkus in the concentration of diphtheria antitoxin with sodium sulfate. By following the original method, the amount of salt in the purified antidysenteric serum after repeated freezing and thawing ranged from 3.99 to 4.08 per cent, and this made the filtration of the serum difficult owing to the concentration of salt and gelatinous proteins that clogged the pores of the filter. Besides this difficulty the filtrate was found to have lost much of its immunologic properties. Instead therefore of freezing and thawing the serum, they dissolved the precipitate in water and immediately dialyzed it for not more than three days. By this method the serum after dialysis contained only an average of 0.12 per cent salt, and it filtered easily through a Seitz filter. In one performance one Seitz filter yielded about 300 cc. of filtrate in from three to four hours. The serum thus prepared possessed high protective properties and compared favorably in potency with the original unconcentrated serum, as shown by the results of protection tests. The purified serum is practically free from sero-albumin.

**Avoidance of Complications of Prostatic Resection.**—Bumpus points out that many of the complications following resection are attributable to errors in the preparation of the patient. In addition to the routine physical examination, roentgenograms of the urinary tract should exclude calculi of the kidneys, bladder and prostate. Unless diverticula are removed, resection will prove a failure as far as relief of symptoms is concerned. If impairment of renal function is great or urinary infection pronounced, transurethral surgery may be contraindicated and suprapubic cystostomy indicated. With suprapubic drainage the possibility of bleeding following resection is considerably reduced, as the patient does not need to void through the urethra until healing is complete. However, it tends to prolong convalescence, for the patient never feels that he has completely recovered until the suprapubic sinus has healed. A cystogram prior to surgery may demonstrate diverticula that do not empty and may demonstrate deformity of the bladder and not infrequently be the first clue of a nerve lesion which, rather than prostatic hypertrophy, may be the cause of the symptoms. It is prior to operation that prophylaxis against infection can best be instituted. The most distressing postoperative complication is incontinence. The proximal boundary of the field of operation is the verumontanum surrounded by the external sphincter. To excise tissue beyond this is to risk incontinence, and to excise the verumontanum is to lose the landmark of the safety zone. In transurethral resection the urethra must receive careful consideration. When this is neglected, stricture, the second most distressing postoperative complication, will inevitably occur. A stricture of the anterior or pedunculous portion of the urethra can never be cured and passage of sounds is a lifelong necessity. If only prostatic tissue is resected, urinary extravasation cannot result, but, if the base of the bladder or the prostatic capsule is perforated, extravasation of urine with all its distressing results is liable to occur. Sepsis, hemorrhage and uremia long associated with postprostatectomy may result but usually are

less severe and more easily controlled after resection. Residual urine and postoperative dysuria are probably more frequent following resection with a loop electrode than following prostatectomy.

**Pseudo-Icterus of the New-Born.**—Pierce considers a group of cases in which the fetus appears to be jaundiced when it is born and loses most or all of the cutaneous discoloration with the first bath. Instances of this kind are not uncommon, yet they have inspired little comment. He designates the cutaneous manifestation of the syndrome as pseudo-icterus. The bodies of these infants do not show gross anatomic abnormalities. Their color varies from a muddy green to a bright greenish yellow. Because the vernix and the superficial epidermis alone have absorbed the pigments, the skin after cleansing looks normal or only slightly discolored. He cites eight cases which illustrate varying clinical manifestations on the part of the mother and all permit the inference that the fetus was slowly deprived of oxygen owing to an overmature placenta or one impaired by pathologic lesions. He concludes that greenish yellow discoloration of a newly born infant, pseudojaundice which disappears after its first bath, is attributable to the impregnation of the vernix and the superficial epidermic cells with bile pigments from the meconium. Its evacuation into the amniotic fluid, as well as changes of the fetal heart action and premature respiratory movements, occasionally occur well in advance of parturition; they are the consequences of fetal distress. What inaugurates these phenomena remains problematic, but strong suspicion is directed toward the placenta, which may become senile before the onset of labor, especially in cases of postmaturity. The prolongation of pregnancy, which has been described in experimental animals, is attested by the clinical observation of pregnant women.

**Method of Skin Grafting Small Areas.**—Bronaugh utilized an elastic adhesive dressing in a case in which pinch grafts were used. The dressing is sufficiently water tight to keep the wound continually bathed in its own secretions. This lymphatic exudate has the necessary bacteriophagic property to destroy ordinary infections present and to prevent bacterial invasion. Also it is the best medium for growth of new delicate epithelial cells. The wounds left by removal of the grafts were also treated with elastic adhesive, exactly as the burned area. At the first dressing, nine days later, seven of them had healed and at the second dressing eighteen days later they were all healed. The patient was active at all times and did not complain of discomfort. The apparent advantages of the method are that it can be an office procedure, the patient is ambulatory, bathing the wound with saline solution is eliminated, and daily inspection and dressing are eliminated. The pressure from the tension dressing keeps the grafts in place, keeps the granulations level and enables epithelization from each graft and the wound edges to occur more rapidly.

\*Factor of Immunity (Serologic) in Furunculosis. J. F. Smith.—p. 54.  
Formation of Cheloids in Relation to Treatment of Lupus Vulgaris. F. F. Hellier.—p. 91.

**Lichen Planus of the Vulva.**—Hunt discusses seventy-three cases of lichen planus of the vulva, of which thirty-three showed some degree of atrophy or contraction of the vulva; viz., "kraurosis." The diagnosis of a lichen planus eruption is often fraught with difficulty when lesions of a rarer type predominate. Lesions were confined to the vulva and adjacent parts in only fifteen of the present cases, and in all the others lichen planus lesions of various types were present at sites remote from the vulva. When it is recalled that a lichen planus eruption may cause no direct or very slight subjective symptoms, the possibility arises that many patients suffering from lichen planus of the vulva never seek advice and that in other cases advanced atrophic changes of the vulva may be found in which symptoms have developed only at a later stage owing to the atrophic changes that have occurred. No causative factors for leukoplakia vulvae have been determined. The etiology of lichen planus is obscure, but ovarian dysfunction has never been suggested as a predisposing factor, since the eruption occurs in both sexes. Derangements of the nervous system following debilitating illness, anxiety, worry and overwork have long been recognized as associated factors in the causation of lichen planus, though many cases are on record in which none of these factors could be determined. Leukoplakia vulvae is stated to be a precancerous condition. Lichen planus is not a precancerous condition. Certain factors may be considered to contribute to the development of epithelioma in atrophic lichen planus lesions on the vulva. When atrophy of the vulva occurs there is increased friction of atrophic surfaces due (1) to the suppression of the secretions, owing to atrophy of the glands, with which the skin of the vulva is well supplied and which keeps the parts well lubricated, and (2) to the absence of the labia minora, which normally provide a soft buffer between the larger labia and protect the vestibule. In addition the dryness of the atrophic surfaces is in many cases aggravated by prolonged and/or ill advised applications for the relief of itching.

**Immunity in Furunculosis.**—Of the sixty-one cases in Smith's series, five were either cases of solitary boils or of several occurring simultaneously. The remaining fifty-six were of the recurrent type, and of these twenty were treated with formoltoxoid. Ten of these twenty were completely cured, four were improved, five were unimproved, and one was cleared but relapsed when local treatment was discontinued. Local treatment was given in all cases. Of thirty-six cases in which only local treatment was given, thirty-three were cured and three unimproved. As local treatment was given in all cases, the slight advantage shown by the cases in which no toxoid was administered is presumably accidental and devoid of real significance, but this investigation has afforded no evidence that injections of toxoid are of material value in the management of recurrent furunculosis, although they have a striking effect in raising the antistaphylococcal content of the serum. The average rise observed was to about sixteen times the original titer. Of four cases treated with autogenous vaccines, two were cured and two unimproved. The antibody titer was raised in one to eight times and in another to twice the original figure, while the remaining two showed no rise. This variation in the antigenic powers of different strains suggests that, if a

vaccine is to be used at all, a good stock one, made from a strain of proved antigenic power, is likely to act better than an autogenous one. The case that showed the highest rise was unimproved, and one of the two that were cleared relapsed later and was not helped by a long series of injections of a so-called dissolved vaccine. The only permanently cured patient of the four was the one who showed no antibody response. Severe reactions to injection of the toxoid were uncommon. The whole trend of the investigation emphasizes the importance of local factors and the relative unimportance of the "immune state" of the patient, in dealing with furunculosis. Glycosuria, of course, is an occasional factor of prime importance and has been excluded from the present series.

The Vi Antigens of Various Salmonella Types. A. Felix and R. Margarett Pitt.—p. 81.

**Carbonic Anhydrase Content of Blood in Pathologic States.**—Hodgson followed the distribution of carbonic anhydrase in the blood of normal subjects and in patients with various pathologic conditions. The amount of carbonic anhydrase varies over a wide range from 4.7 to 27 units in 10 cu. mm. of blood as compared with a range of from 13.9 to 17.5 units for normal subjects. The hematocrit values for the two groups range respectively from 12 to 60 and from 40 to 47 per cent of cells. Since cases are encountered that have a very low absolute carbonic anhydrase content in the blood and yet do not show marked impairment of respiratory function, it is reasonable to infer that in normal individuals there must be a considerable excess of enzyme over ordinary requirements. The data in the main show a rough correspondence between carbonic anhydrase and readings of the hematocrit. The most obvious condition in which to find an abnormal anhydrase content would be anemia. Low absolute values for carbonic anhydrase are shown in all cases except one—a case of pernicious anemia. This case showed 20.7 units of anhydrase, an icteric index of 21 and a reticulocyte count of 19 per cent. Another case of pernicious anemia showed 6.1 units of anhydrase, but only an occasional reticulocyte was present. The high anhydrase value of the former case may thus possibly be related to the number of reticulocytes present in the blood. All the other cases of anemia show low anhydrase values, and thus there is a rough correspondence between the low anhydrase content and the low hematocrit reading. However, the anhydrase index is on the average higher than for the normals, and the inference is that the blood corpuscles, less in number, are carrying more anhydrase. Five cases of cyanosis show an increased amount of carbonic anhydrase in the blood. All these cases except one show an increase in the hematocrit reading. The exception is a case of cyanosis from acetanilid poisoning, which gave a positive test for methemoglobin in the blood. A case of polycythemia vera, although having the highest hematocrit reading, has an anhydrase content only proportionately high, thus giving an anhydrase index within the normal range. All the cases of jaundice have raised anhydrase values and at the same time normal hematocrit readings, with the result that the anhydrase indexes are raised above the normal in every case. It is pos-

sible that this observation may be due to the lowering of surface tension caused by the presence of bile salts. If in vivo the enzyme is within the corpuscle, the substrate must diffuse inside the cell in order that the reaction may take place; if, on the other hand, the enzyme is located on the surface of the corpuscle, a decrease of surface tension might facilitate the reaction between enzyme and substrate. This increase in carbonic anhydrase in jaundice would thus seem to favor the supposition that the enzyme is situated at the surface of the corpuscle.

**Chronic Infection of Sacro-Iliac Joints and Spondylitis Adolescents.**—Scott asserts that the onset of spinal symptoms signifies not the commencement of the disease but the final stages of a long standing pathologic condition. The primary cause of spinal arthritis of the young adult is in some way connected with an infection of the sacro-iliac joints, but in many instances they would seem to account for the recurrent attacks of so-called muscular rheumatism so frequently encountered in the young adult. The history of many of these cases goes to show that during the prespondylitic period the pains and aches that these patients experience are mistaken for various diseases. If the early stages of this infection of the sacro-iliac joints—the precursor of spondylitis adolescents—is to be detected, a routine roentgenographic examination of these joints must be carried out in every case in which recurrent attacks of muscular rheumatism, extending over a number of years, occur in the young adult. The roentgenographic interpretation of the sacro-iliac joints is difficult, and the recognition of early pathologic changes requires considerable experience; the age of the patient must be taken into consideration, as in early life the appearances of the sacro-iliac joints suggest some abnormality. Care must also be taken that the roentgenogram is standardized technically. The prognosis is bad, but it may be more hopeful in the same way as the removal of an infected appendix, gallbladder or tooth may influence a general arthritis, if the cause of the disease can be found and removed.

### Hydrated Magnesium Trisilicate in Peptic Ulceration.

—Mutch points out that the presumptive suitability of hydrated magnesium trisilicate for the treatment of chronic peptic ulceration in the stomach, duodenum and jejunum depends on a combination of properties: 1. Its antacid power is sustained for hours in the presence of an excess of acid. This facilitates the continuous control of hyperchlorhydria in the gastric contents as a whole and also furnishes a basis for local antacid therapy in the floor of the ulcer. In the presence of acid the trisilicate acquires a gelatinous consistency and, if any of the mass lodges in the crater of the ulcer, it will progressively neutralize the acid which diffuses through it. 2. Its adsorbent power is sustained and cannot be exhausted in a few hours, and it cannot be saturated with foodstuffs adsorbed from the gastric contents. A great reserve will always be left for the removal of soluble necrotic products at the site of the ulcer and of toxic substances in general. 3. It has strong antipeptic powers available for the protection of the base of the ulcer from destructive digestion. 4. As its antacid power is utilized, hydrated silica is liberated in a form possessing strong adsorptive affinities for pepsin, food poisons and other substances. This activity of the end product intensifies the absorbent effect of the magnesium

trisilicate. 5. It can be given in large doses without disturbing the general motility of the digestive tract. It does not cause either constipation or diarrhea. 6. No matter how much may be given it cannot reduce the gastric reaction materially below the neutral point. 7. Being insoluble in water, any unused excess is voided in the stools. It cannot be absorbed and so produce direct alkali poisoning. Fifteen patients with chronic peptic ulceration were treated with synthetic magnesium trisilicate. No other antacid preparation was employed. In every case the desired result was obtained with doses not exceeding 16 grains (1 Gm.) (anhydrous weight), but with very high acid figures it would appear advisable to use a higher scheme of dosage.

**Studies in Serology of Syphilis.**—Basu and Chatterjee studied the serums of 561 cases by means of two modifications of complement fixation tests and two flocculation tests. An endeavor has been made to modify the complement fixation test in the light of recent work on serology. No single test has been able to diagnose all the cases of clinically known syphilis; the combination of more than one test is recommended. Quantitative complement fixation tests with variations in serum have given much more satisfactory results than those in which varia-

tions in complement are used. Judged from the point of view of sensitiveness the authors place the tests in the following order: serum dilution method (complement fixation), Harrison's method (complement fixation), Meinicke-Klarungs reaction II (flocculation) and Kahn standard test (flocculation). The Meinicke-Klarungs reaction II is more sensitive than the Kahn test but has a tendency to give more nonspecific positive reactions in epidemic dropsy and cancer cases, a point that ought to be investigated. About 3.5 per cent of cases of clinically known syphilis still remained undetected even when multiple tests were done, neurosyphilis constituting 2 per cent and other varieties 1.5 per cent. Malaria and kala-azar do not seem to have any effect on the tests.

**Relation Between Diet and Urinary Excretion of Cevitamic Acid.**—Chakraborty and Roy investigated the relation between the ingestion of high carbohydrate, high protein and high fat diets and the urinary excretion of cevitic acid on two healthy Bengali young men. In the first subject they observed the average daily urinary output of cevitic acid to be 9.54 mg. on the usual Bengali high carbohydrate diet; it rose to 12.07 mg. on the meat diet. It fell to 10.21 mg. when the subject was placed again on the usual high carbohydrate diet but rose again to 14.09 mg. on the high fat diet. On the resumption of the ordinary diet it fell to 9.57 mg., and it again rose to 14.65 mg. when the subject was placed on a casein diet. In the second subject the usual high carbohydrate diet gave a cevitic acid value of 9.75 mg., which rose to 11.08 mg. on a meat diet. A period of the usual high carbohydrate diet brought the level down to 8.51 mg., which rose again to 14.8 mg. on a high fat diet. On being diverted to the usual high carbohydrate diet, the level fell to 10.46 mg. and rose again to 13.12 mg. on a casein diet. It is not improbable that the higher figures for the urinary excretion of cevitic acid in England, as given by Harris and Ray, are due to the greater consumption of meat in that country. The relatively lower figures obtained by the authors do not necessarily indicate vitamin C subnutrition, as in some unpublished experiments they have found that a sharp peak is produced in the urinary excretion of cevitic acid on the ingestion of extra vitamin C. It appears possible that cevitic acid has some special rôle in the metabolism of fat and protein. The possibility of the presence of other reducing substance or substances in the urine, which might complicate these results, is under investigation.

**Sinus Sepsis and Mental Disorder.**—Jowett examined 500 routine cases of mental disease and found nasal sinus infection in 7.6 per cent. This percentage is compared with a similar one found in a similar series of cases in which similar criteria were used. It shows only a slight difference. In a control series of 184 mentally normal individuals the incidence of sinus suppuration was found to be not less than 5 per cent. Pioneer workers in this field reported a higher incidence. Their observations have promoted general investigation of the nasal accessory sinuses in mental disorder. Although subsequent investigations may prove a lower incidence of sinus disease in mental hospital patients than at first found, an incidence of up to 10 per cent infection demands investigation and treatment on

grounds of general and possible local disorder. It is concluded that the incidence of sinus disease in mental disturbance is not greater to any appreciable degree than among the general population.

**Familial Tendency to Hepatic Cirrhosis.**—Weber states that cases of hepatic cirrhosis in children, not due to alcohol or congenital syphilis or any known cause of cirrhosis, are usually regarded as the manifestation or one of the manifestations of a congenital-developmental disease, and the occasional familial incidence of cirrhosis has often been adduced in support of this view. He discusses the data in favor of there being an inborn tendency to hepatic cirrhosis and arranges his remarks under two headings: (1) examples of the familial incidence of hepatic cirrhosis, in which the cirrhosis has not been due to any known exciting cause, such as alcohol or syphilis, or in which an inborn familial tendency to the disease may be presumed because an exciting cause, such as alcohol, though present in one of the affected members of the family was absent in others; and (2) examples of hepatic cirrhosis accompanying and probably constituting a part of acknowledged diseases of the congenital-developmental class. Under congenital-developmental diseases and abnormalities he includes all truly inborn abnormalities and constitutional diseases, whether obvious at birth or manifesting themselves later at various ages (hemophilia, hemolytic [acholuric] jaundice, congenital porphyria, amaurotic family idiocy, renal glycosuria, food idiosyncrasies and allergic peculiarities).

Anatomic Study of Conduction System of Heart in the Human New-Born and Fetus. K. Matsuda.—p. 57.

**Slight Degree of Ileus During Pregnancy.**—Yun presents two cases showing a slight degree of ileus during pregnancy due to an abnormal condition of the sigmoid flexure. The two showed classic signs and symptoms, and they were quite easily diagnosed. The sigmoid was enlarged and elongated, the junction between the descending colon and the sigmoid was sharply flexed, and a slight degree of torsion was present. Severe abdominal pain, distention of the abdomen, nausea, vomiting and headache were present. The ileus occurred at the sixth and the seventh month of pregnancy, respectively. If acute ileus with grave symptoms and signs is present, operation is indicated. In many cases the prognosis is bad, but in one of the author's cases a good result was obtained with medical treatment. Correct diagnosis is imperative and can be facilitated roentgenologically.

 Treatment of Fractures of Maxillary Condyles. L. Lebourg.—p. 360.

**Total Sterilization.**—Gudin discusses in some detail the fact that asepsis in operating rooms is less satisfactory than is generally believed. It is because of this fictitious asepsis that bacteriologic complications of operations are still so common. He has attempted to correct this situation by hermetically sealing his operating room and sterilizing the air in it by means of formaldehyde. In order to neutralize the toxic gas, an exactly proportional dose of ammonia is later introduced. Finally the air is filtered through a solution of tartaric acid in sterilized water. The results of the systematic application of this system were as follows: 1. Pure cicatrization without microbial interference was constantly observed. 2. The serous and bloody exudates were naturally resorbed as soon as their drainage became unnecessary from the standpoint of infection. 3. Nonresorbable foreign bodies remained well tolerated in the organism. 4. Drainage was no longer a factor of contamination. 5. The regions previously contaminated did not receive further contamination from the air. He believes that the true asepsis which he can now create introduces a new period into the practice of surgery.

- \*Endocrine Hepatocardiac Syndrome. L. de Gennes, J. Delarue and R. de Véricourt.—p. 377.  
 Fundamental Elements of Treatment of Poliomyelitis. E. Terrien.—p. 381.

**Endocrine Hepatocardiac Syndrome.**—De Gennes and his collaborators studied a syndrome characterized by the existence and simultaneous development of a cirrhosis with cutaneous pigmentation, stigmas of infantile regression and, finally, severe cardiac insufficiency. Two observations are reported in which these three elements were found to be almost identical. It was impossible to determine their clinical order but the endocrine signs were apparently the first and preceded by a considerable period the appearance of pigmentation, the enlarged liver and the cardiac insufficiency. The syndrome affects boys primarily. Thorough histologic examination of the tissues in such cases indicates a typical cirrhotic pigmentation, extensive endocrine lesions (especially of the pancreas, thyroid, suprarenals and testicles) and an atonic dilatation of the heart with sound myocardial tissue. It is uncertain whether the endocrine lesions are at the basis of the clinical syndrome and are sufficient to explain the cirrhosis and the myocardial damage. The authors believe that this question is a matter well worth further study.

 Sign of Gastro-Intestinal Perforation in Inguinal Hernia. G. Casciari.—p. 411.

**Method for Determination of Dextrose in Urine.**—Gugliucci describes a new method for quantitative determination of dextrose in the urine. It is based on the phenomenon of disappearance of the yellow in a potassium ferricyanide solution when dextrose is added to it at a high temperature. The phenomenon is due to the reduction of potassium ferricyanide by dextrose to potassium ferrocyanide. The reagent consists of a solution prepared with 9.90 Gm. of potassium ferricyanide, 60.85 Gm. of anhydride of sodium carbonate and a sufficient quantity of distilled water to make up 1,000 cc. of the solution. The solution is of an intense yellow and is stable. If 100 cc. of the solution is heated to the boiling point and a 1 per cent solution of dextrose is added drop by drop, the yellow disappears from the solution when enough dextrose has been added to make 0.01 Gm. The technic of the reaction is as follows: Ten cubic centimeters of the reagent is placed in a large test tube and brought to the boiling point. The sample of urine is added quickly drop by drop from a pipet graduated in hundredths

of a cubic centimeter. After each drop is added, the solution is heated and its color examined until the yellow in it fades notably. The solution is kept boiling for a few seconds and allowed to cool. One then observes that the solution is no longer yellow. The quantity in cubic centimeters of urine is read from the pipet and in this manner the amount of dextrose in the urine is calculated. The calculation is made by dividing 10 (which is the amount of reagent solution used) by the number of cubic centimeters of urine added to it to produce the reaction. The result represents the amount of dextrose in grams contained in 1,000 cc. of urine. The reaction is visible under natural and electric light, and it is stable. It can be done with all the refinements used in other known methods of quantitative determination of sugar in urine; that is, dilution of the urine to one tenth in cases of notable glycosuria, purification of the urine when it contains large quantities of reducing substances and also dealbumination of it. The reaction gives results as exact as those given by other known methods, but it has the advantage over the others of its easier technic, rapid results and the use of only one reagent which is not expensive.

 Studies on Number of Thrombocytes During Childhood. F. Becker.—p. 230.  
 Rare Forms of Nevi During Childhood. R. Steindler.—p. 237.

**Pulmonary Abscesses During Childhood.**—Priesel shows that postpneumonic pulmonary abscesses in children usually yield to purely conservative measures which aim at an improvement of the general condition and at an increase in the defense powers of the organism. Observations in twenty cases of postpneumonic pulmonary abscesses demonstrate that such measures nearly always result in cure. In pulmonary abscesses caused by aspiration of foreign bodies, conservative treatment is not enough and treatment by a specialist is necessary. Pulmonary abscesses, which develop metastatically by way of the blood stream from a suppurative focus (for instance in malignant mastoiditis with sinus thrombosis, in furunculosis or osteomyelitis) and are frequently multiple, have a rather unfavorable prognosis, although recovery occasionally occurs even in these malignant cases.

**Disorders of Accessory Sinuses in Nurslings.**—In the course of necropsies on 232 nurslings, Schönberg detected 154 with empyema of one or several of the accessory sinuses. The incidence of the sinus complications was especially great in the dyspeptic children and the question arises whether there is an etiologic connection between dyspepsia and empyema of the sinuses. The author suggests that, in view of the parenchymatous impairment of the liver existing in the majority of cases of dyspepsia, it may be assumed that, following a coryza or after another slight cold, empyema of the accessory sinuses develops which, particularly in the cases of otitis media, attacks the adjoining bone. This process is often slow and may cause only slight elevation of temperature. Depending on the duration and severity of the process, impairment of the liver results, which in turn manifests itself in a digestive disturbance. The author admits that these studies are still inadequate, but she stresses that in nurslings a cold or a coryza is not as insignificant a matter as is often assumed, as it may lead to empyema of the maxillary sinus or to disorders of the middle ear. With regard to the treatment of the sinus disorders in nurslings, she says that short wave therapy is advisable. Moreover, in nurslings with dystrophy, treatment of the liver by means of dextrose may perhaps prove helpful in addition to the usual measures.

**Roentgen Irradiation of Erysipelas in Nurslings.**—Sonnauer asserts that erysipelas is extremely serious in nurslings, for the mortality rate is high. According to most statistics it

is more than 50 per cent for nurslings less than 6 months old. In order to improve this unfavorable prognosis, the author decided to resort to roentgen therapy, which, according to numerous reports, had produced favorable results in erysipelas of adults. The treatments were given with a tension of 170 kilovolts through a filter of 0.5 mm. of zinc, at a focus-skin distance of 30 cm. and with an intensity of 28 roentgens per minute (measured in the air). The dose for each field was usually from 80 to 100 roentgens. The rays were applied not only to the area involved by the erysipelas but also to two fingerbreadths of the surrounding healthy tissues. The author cites a number of cases that demonstrate the favorable results of this treatment. One or two irradiations were usually effective. After from twenty-four to forty-eight hours there was usually a lytic reduction in fever and further extension of the process ceased, the redness of erysipelas being replaced by a reddish brown. The author advises that, if these effects fail to appear, the irradiation should be repeated after two or three days. He employed the roentgen treatment in twenty-seven cases. In seven of these the erysipelas was the partial manifestation of a generalized sepsis, the children being admitted to the hospital in a moribund condition. These died one or two days after the irradiation. However, of the other twenty cases (thirteen nurslings and seven children) only one terminated fatally and the other patients recovered.

**Tuberculous Bronchostenosis and Bronchial Carcinoma.**—On the basis of two cases, which were under observation for a long time and were anatomically investigated, Fleischner describes the clinical aspects of tuberculous bronchostenosis that leads to complete closure. Tuberculous anthracotic proliferations that originate in the tracheobronchial lymph nodes lead to deforming bronchitis and progressively to severe stenosis of the lobar bronchus. These changes are apparently most frequent in the middle lobe of the right side. As a result of the stenosis, atelectasis or atelectatic pneumonia develops in the pulmonary lobe and, finally, a permanent induration of the lobe. In rare cases the closure causes suppurating bronchitis, abscesses and gangrene. But there is also the possibility of a flare up of the tuberculosis and of cessation and softening. Clinically, the patients present the signs of old hematogenic tuberculous changes, such as apical and pleural indurations, calcified pulmonary and glandular foci, indurative mediastinitis, adhesive esophageal diverticula, esophagobronchial fistulas and extrapulmonary foci. During the early period of the disease a dry cough develops and occasionally there is hemorrhagic sputum. Dyspnea appears as a rule quite suddenly. This is the time of the development of the lobar atelectasis. It may take place without general manifestations or it may be accompanied by chills and fever and present the aspects of lobar pneumonia. In the first case the disease results in the development of lobar cirrhosis and the author thinks that many of the so-called hepatization pneumonias are postbronchostenotic lobar cirrhoses. In the second case there develops a chronic disorder characterized by irregular attacks of fever, and, if the course is unfavorable, suppurating bronchitis, abscess formation and gangrene may occur; in other cases it is the first sign of a flare-up tuberculosis that presents the aspects of the generalized phthisis of the aged. Concerning the diagnosis it may be said that one lobe, usually the middle one, shows greater density. Bronchostenosis can be recognized by auscultation, by the weakened or abolished respiratory sound, by the

roentgenologic sign of mediastinal oscillation, and finally by bronchography. A tuberculosis in the anamnesis and the course the disorder takes permit only a conjectured differentiation from bronchial carcinoma as the most frequent cause of a bronchostenosis and from other rarer forms of inflammatory or tumorous bronchostenosis. A definite differentiation is possible only by means of bronchoscopy and biopsy. Compared with the incidence of cancerous bronchostenosis, the tuberculous form is rare.

**Sex Urge in Patients with Tuberculosis.**—Barglowski reports the results of anamnestic studies on the sex life of twenty patients with tuberculosis. He found not a single case in which it could be definitely proved that the tuberculosis caused an increase in the sexual urge. In a few cases there were some indications, but he suggests that even in these cases the tuberculosis was at most a factor in the tendencies to which the person had been disposed before the development of the tuberculosis. Relations of the sex urge to a toxic or a nontoxic course of the tuberculosis could not be detected. The author attempts to show in what manner the widely accepted opinion of an increase of the sex urge may have arisen. He calls attention to some external factors, such as the development of tuberculosis at the time of puberty when the sex urge develops. He mentions the importance of the constitutional type for the development of tuberculosis (large number of leptosomes) as well as for the characterologic development and the sexual behavior, pointing out that a greater sexuality may be the result of schizothymia rather than of tuberculosis. Observations on some cases indicated that the lack of interests and occupation influences the behavior of the sexual urge.

**Active Diphtheria Immunization of Tuberculous Children.**—To prevent the further spreading of diphtheria in a sanatorium for tuberculous children, active immunization was resorted to by Starcke. However, he found that, of 100 children who were given three injections of 1 cc. of diphtheria toxoid, five showed exacerbations of the tuberculous process after the third injection. After that he used the milder acting toxoid-antitoxin floccules, but of thirty-five children who were immunized in this manner one showed a considerable exacerbation of the tuberculous process after the third injection. He maintains that the further spreading of the tuberculous process is the result of the reduction in the resistance that is involved in the immunization. He concludes that, in the form of the triple injection, toxoid as well as toxoid-antitoxin floccules is dangerous for children with active tuberculosis.

**Vitamin C and Antithyroid Action.**—Schäfer directs attention to studies by Demole and Ippen which demonstrated that, in the case of simultaneous administration of vitamin C (cevitamic acid) and thyroxine, vitamin C counteracts the effects of thyroxine. Other studies conducted by these authors demonstrated that under the influence of thyroxine the vitamin C contents of liver and spleen disappear. On the basis of these observations, it was assumed that vitamin C has an antithyroid action and that its application is justified in cases of exophthalmic goiter. Other investigators had observed a similar antagonistic behavior between thyroxine and carotene or vitamin A. In view of the results obtained by Demole and Ippen and of the action of vitamin A, Schäfer decided to investigate the point of attack of vitamin C as well as the justification of its use in exophthalmic goiter. He has studied vitamin C in the histologic thyroid test on guinea-pigs, as well as by means of Gundersen's tadpole test, and reaches the conclusion that vitamin

C has no antithyroid action and that consequently it cannot be used to influence the thyroid. Although an unqualified assertion that these results apply also to human subjects is not permissible, it can nevertheless be assumed by analogy with pharmacologic observations on thyroid extracts that vitamin C is incapable of exercising an essential influence on the human thyroid and thus holds no promise of an effective therapeutic application in exophthalmic goiter.

**Increase in Blood Sugar During Renal Diseases.**—Oefelein studied the significance of lesions of the renal parenchyma for the blood sugar content in patients without diabetes. He made dextrose tolerance tests on patients with nephrosclerosis and with glomerular nephritis and found that such tolerance tests produce considerable disturbances in the sugar metabolism in that the normal blood sugar level of the fasting stomach increases to a high level but also subsides again within a comparatively short time and that, in spite of considerable hyperglycemia, there is no glycosuria. These observations indicate that the kidney plays an important part in the regulation of the sugar metabolism. It is generally known that a normal sugar metabolism is produced by two organs: the pancreas, which produces the insulin, and the liver, which with the aid of insulin changes the dextrose to glycogen. The author points out that his studies make it appear likely that the kidney functions as a signal for the insulin secretion by the pancreas. He assumes that the intact glomerulus sends out an impulse that stimulates the insulin production. In case of severe lesions of the renal parenchyma, the kidney is incapable of signaling for the mobilization of the insulin at the right time, the reflex insulin elimination takes place too late, and a temporary hyperglycemia is the result. However, the stage of glycosuria is not reached because the pancreas functions properly and produces a sufficient amount of insulin to reduce the blood sugar to normal values in a comparatively short time. This assumed signal action of the kidney in insulin production also explains several other observations; for instance, the fact that a tolerance test with the same quantity produces usually the same type of blood sugar curve in the same person, while in different persons the same quantity produces different curves. This factor might be explained by the differing individual sensitivities of the renal parenchymas. Moreover, the temporary hyperglycemia that often appears in toxic and infectious processes might be explained in this manner, in that the intoxication impairs the sensitivity of the kidney as an indicator. However, the glycosuria in the absence of hyperglycemia, which also occasionally appears in renal disturbances, is not explained in this manner. The author suggests that this glycosuria is probably caused by the pathologic formation of glycogen in Henle's loops.

**Hormone Disturbances of Male Sex Function.**—Steinach and his associates call attention to earlier laboratory tests which revealed that postpubertal castration of male rats results in a changed creatine metabolism, in that the animals lose the capacity to utilize the creatine they take in with the food and eliminate it largely unchanged in the urine. This result of castration is limited to the male sex. Moreover, the creatinuria always disappears following the injection of androgen but is increased by estrogen. Since eunuchoid rats likewise show an increased elimination of creatine, the authors conclude that the creatine test is an objective method for the determination of the endocrine function of the testes. They point out further that these experimental results corroborate and support the clinical observation that senile and eunuchoid men utilize only small amounts of administered creatine. They decided to devise a creatine test for detection of sexual disturbances caused by

hormone deficiencies. They determined the capacity to utilize creatine by means of a creatine tolerance test. At first they resorted to the intravenous injection of creatine, but later the test was simplified by letting the patients eat 150 Gm. of cheese (emmentaler) and dark meat and then determining the creatine content of the twenty-four hour urine. The authors give a tabular report of the results they obtained with this test and conclude that the creatine reaction represents an objective indicator of the endocrine function of the male gonad and that it makes possible the differentiation of the sexual disturbances caused by endocrine deficiencies from those of other origins. If a person with sexual insufficiency excretes more than 10 per cent of creatine in the urine, an incretory deficiency exists, whereas values below 10 per cent indicate other etiologic factors, such as psychic factors or disturbances in the sympathetic nervous system. The authors describe their therapeutic experiences with androsterone benzoate in sexual insufficiencies. They gave intragluteal injections of 5 mg. of the preparation four times each week and continued this treatment for at least four weeks or longer. The cases treated were chiefly those with deficient erection or complete loss of potency. The first normal erections frequently appeared after eight or ten injections but, in order to obtain a more lasting effect, further injections are necessary. The cases in which this treatment was employed included those in which the sexual insufficiency was of endocrine origin as well as some in which it was due to other causes. The results were favorable in about 75 per cent of the cases, including many in which the sexual disorder was of psychogenic origin or was due to disturbances in the sympathetic nervous system. In patients with ejaculation praecox without noticeable deficiency of erection the results were often negative and the authors conclude that endocrine treatment is not indicated for these cases. The treatment also effected improvements in the general condition of the patients comparable to those produced by vasoligation.

**Aminoacetic Acid Treatment in Progressive Muscular Dystrophy.**—Borst and Möbius report four cases of typical progressive muscular dystrophy in which they resorted to the administration of aminoacetic acid. Only one of the four patients showed an improvement after prolonged treatment. The authors did not observe a decrease in the extracreatinuria that resulted from the aminoacetic acid administration; that is, there was no indication that the disordered muscular metabolism was normalized by administration of aminoacetic acid. They point out that besides creatinine there are apparently other substances of an unknown nature which play a part in Jaffé's reaction. The administration of aminoacetic acid to normal persons did not reveal a modification of the creatine-creatinine metabolism. The authors think that the different results obtained with aminoacetic acid by various investigators might be due to the fact that progressive muscular dystrophy is not always of the same nature and that perhaps periods of arrest may occur in the course of the disease, during which the metabolism of the remaining musculature shows normal behavior.

**Involvement of Hypophysis in Diabetes Mellitus.**—Effkemann points out that Anselmino and Hoffmann, in their studies on the hypophyseal regulatory mechanism in human diabetes mellitus, observed an increased elimination of the anterior hypophyseal hormones of fat and of carbohydrate metabolism

in the urine of diabetic patients as well as increased quantities of these substances in their serum. Thus it seemed likely that the excessive production of these hormones plays a part in the pathogenesis of diabetes mellitus. Increased ketogenesis and deficient glycogen fixation in the liver of diabetic patients seem to find a new explanation in the increased presence of the hormones of fat and of carbohydrate metabolism. The author states that it was proved in former studies that these two hormones produce changes in the saturated and unsaturated fatty acids of the liver. It was the aim of these investigations to study in their effect on the fatty acids of the liver the substances that Anselmino and Hoffmann detected in the serum and urine of diabetic patients and identified as the hormones of fat and of carbohydrate metabolism. First the author investigated the effect of the injection of the serum of diabetic patients on the hepatic fatty acids of young roosters and found that the unsaturated fatty acids as well as the total amount of fatty acids increase. He found that the ultrafiltrates of the alcoholic precipitates of diabetic urines, which have a  $pH$  of 9.17, produce in rats an increase in the unsaturated fatty acids and in the total amount of fatty acids. Ultrafiltrates of a  $pH$  of 5.42 produce a reduction in the saturated and unsaturated fatty acids. The author concludes that these studies furnish a new proof for the increased occurrence of the hypophyseal hormones of fat and of carbohydrate metabolism in the blood and urine of patients with diabetes mellitus.

**Hyperergic Phenomena and Histamine.**—Gotsch employs the term hyperergic as equivalent to allergic in the sense of a hypersensitivity. He points out that recent studies indicate that the antigen-antibody reaction of the allergic organism is caused by a toxin. The great similarity of hyperergic manifestations, especially of anaphylaxis, with the shock produced by the injection of histamine leads to the assumption that the toxin is a histamine-like substance or actually histamine. After citing studies that proved the presence of a toxin of histamine nature in the anaphylactic shock of dogs and guinea-pigs, the author reports his own studies on eighty-two persons without signs of an allergic disturbance and on forty-five allergic patients. He tested their reactivity to a weak galvanic current and to histamine. Summarizing, he states that there is no definite relationship between an allergic reaction and the skin reaction to the electrical irritation, for in patients with allergy such a reaction was often absent, while it was occasionally present in persons without allergy. However, the majority of allergic patients (forty out of forty-five) manifested a hypersensitivity to insulin. Nevertheless, histamine hypersensitivity is not necessarily a sign of an allergic condition, for it occurs also in persons without allergy, although it is most frequent in persons with hyperirritability of the vascular nervous system. The author points out that, in view of the fact that histamine plays a part in the majority of methods which have been recommended for nonspecific desensitization, it seems justified to try histamine in the treatment of allergic patients. He did this by administering histamine transcutaneously by means of a galvanic current of 8 milliamperes. The cathode was dipped in water and the anode in a freshly prepared histamine solution of 1:20,000 and applied to the chest or forearms. The first application lasted only five seconds, so as to avoid undesirable secondary effects. The duration and number of the later applications depended on the cutaneous reactions. In the course of the first two or three weeks the treatments were given daily as a rule, and in the following two or three weeks they were given two or three times weekly. This mode of treatment was employed in thirty-five allergic patients (thirty with bronchial asthma, two with migraine, one with hay fever and two with mucous colitis). Of the patients with asthma, five were completely cured and sixteen were greatly improved, while in the remaining nine the treatment proved ineffective. The patients with migraine were freed from their complaints, but the patients with hay fever and colitis showed no improvement. The improvement in the successfully treated patients lasted generally from three to four months, but in three cases it lasted more than a year. The author thinks that histamine therapy could be resorted to not only in cases in which a specific desensitization is impossible (sensitivity against many antigens) but also as an adjuvant to specific desensitization.

Further Studies on Mechanism of Development of Physiologic Genital Milieu. L. von Dobszay.—p. 707.

**Clinical Aspects of Dysgerminoma.**—Fauvet stresses the main aspects of dysgerminomas: their special position among the tumors of the ovaries and their appearance particularly in young or sexually deficient women and in true or pseudo hermaphrodites. Nevertheless, it has been found that they may appear also in older women and that they do not necessarily impair the reproductive capacity. Moreover, the formerly emphasized clinical symptomatology may fail in the diagnosis and, since dysgerminomas do not produce hormone manifestations like granulosa cell tumors and arrhenoblastomas, other characteristics must be searched for. This is important, not only because dysgerminomas are not as rare as might be assumed, in that they amount to about 3 per cent of the malignant ovarian tumors, but also because their prognosis is not at all unfavorable if they are removed early. The author describes three cases of dysgerminoma which he observed in a comparatively short time. He gives especial attention to the factors that are of value in determining the prognosis. He thinks that from the anatomic point of view tumors rich in cellular elements with negligible supporting tissues have an unfavorable prognosis. These diffuse growing tumors apparently have a tendency to infiltrate the surrounding tissues. However, if the epithelial nests are scarce in a richly developed connective tissue, the prognosis is not necessarily favorable. If hypophyseal hormones appear in the urine, it may be assumed that the tumor has a considerable proliferating tendency, although the tumor is not the source of the hormone. The appearance of the luteinizing factor indicates an unfavorable prognosis. The author also made elastometrical studies on dysgerminomas and found that the solid tumors cannot be designated as hard but rather as of an elastic consistency.

**Transperitoneal Migration of Ovum.**—After pointing out that animal experiments permit no definite conclusions regarding the possibility of transperitoneal or external migration of the ovum in human subjects, Posatti calls attention to the fact that the two tubal funnels are close together and that there is a possibility that the attraction fields of the two tubes, that is, the areas covered by the vortex current of the cilia and the suction of the peristaltic movements, not only border on each other but may even overlap. In view of this fact, it is possible that an ovum from one field reaches the other one. Moreover, there are cases in which conditions exist that prove an external (transperitoneal) migration of the ovum. In this connection the author cites (1) the existence of a pregnancy when the tube is missing on one side and the ovary on the other (such a combination is rare, but a case of this nature has been described by Rokitansky), (2) the existence of a tubal pregnancy in which the corpus luteum is on the other side, and (3) the existence of a pregnancy in a rudimentary accessory horn, if the ovary of the same side has no corpus luteum or is itself absent. To be sure, in this case, as in the event of a tubal pregnancy, the possibility of internal or uterine migration must be ruled out. However, since there exists only rarely a communication between the accessory and the normal horn, internal migration is practically out of the question. In order to gain more insight into the problem of external migration, the author made careful observations in the course of 214 tubal pregnancies that came up for operation in the last ten years. In the forty-five cases in which the ovary had to be removed, the corpus luteum was searched for and was found in twenty-five. However, in twenty cases it could not be found and the author assumes that in these cases it was on the opposite side. Even in some of the cases in which the ovary was not extirpated, the surgical report states that the corpus luteum was on the other side. The author reaches the conclusion that the development of tubal pregnancy may have some connection with

external or transperitoneal migration of the ovum, assuming that owing to the retardation caused by peritoneal migration the ovum is ready for nidation at the time of passage through the tube, and thus a tubal pregnancy results. However, definite conclusions will be possible only after more information has become available regarding the incidence of the transperitoneal migration of the ovum.

**Determination of Sex According to Birthdays of Children.**—Schöner directs attention to his earlier reports on the determination of the sex of offspring from the dates of birth, but he admits that his earlier studies were made on the basis of ovulation cycles of twenty-eight days. In this report he concerns himself with cycles of shorter and longer duration. He thinks that the fact that he is able to determine the sex of the children of a family on the basis of the sex of the first child, of the length of the ovulation cycle and of the birthdays, proves the following points: 1. The ova have their sex character before fertilization, and sex is consequently not determined by a sex chromosome. 2. The succession of the sexes is 2:1 in each ovary, the male sex predominating in the right ovary, the female sex in the left ovary. 3. Under ordinary conditions, the function of the ovaries alternates. He points out that he has been able to determine correctly the sex succession of the children in thirty-two families with from six to twelve children. In four of the mothers the ovulation cycle was 25.92 days, in four 27.32 days and in four 28 days, while in others it was 29.12 or 30.84 days. In a few cases two different ovulation cycles could be used. Of a total number of 218 children, 108 (eighty-two boys and twenty-six girls) originated in the right ovary, while 110 (sixty-six girls and forty-four boys) originated in the left ovary. This proves again that the right ovary produces more boys and the left more girls.

### Hospitaltidende, Copenhagen

79:169-196 (Feb. 18) 1936

\*Etiology of Postvaccinal Encephalitis (in Part Illuminated by Bacteriologic Examination on Necropsy of Case). L. Heerup.—p. 169.

**Etiology of Postvaccinal Encephalitis.**—Heerup says that twelve days after vaccination of two sisters, aged 4 and 7, fever, headache, drowsiness and stiffness of the neck and back set in, with redness of the fauces and swelling of the neck glands. The younger child was discharged as well twelve days after the injection of poliomyelitis serum and smallpox convalescent serum. The older sister, in spite of the injection of poliomyelitis and vaccine serum, became hyperpyretic and somnolent and died two and a half days after the onset of the first symptom. Histologic examination revealed a pronounced infection hyperplasia of spleen, thymus, lymph nodes and liver, especially in the reticulo-endothelial system, with hemorrhages and necroses in the spleen and marked diffuse encephalitis in the brain and medulla oblongata, of the usual type in post-vaccinal encephalitis. Bacteriologic examination of specimens from the organs proper showed a massive diffuse infection with *Staphylococcus pyogenes-aureus* in tonsils and lungs; the other organs were sterile. In the disorder in young children termed by him fulminant tonsillopulmonary toxemia, the author has demonstrated that toxins from infections in the tonsils and lungs, similar to that in this case, can cause rapid, fatal toxemia, and he cites five cases of acute encephalitis in children (Gretha Muhl) which correspond to his toxemia cases. He states that, after vaccination, vaccine virus can for a time regularly be established in the blood and organs; he discusses the possibility that toxins can produce encephalitis when vaccine virus has perhaps affected the reticulo-endothelial system, and he summarizes as follows: An apparently well child is vaccinated. A staphylococcal infection occurs in the tonsils and respiratory passages, or a similar infection hitherto held in check by the reticulo-endothelial system flares up when the latter is affected by the virus. The bacterial toxins cannot be sufficiently bound by the damaged reticulo-endothelial system and cause organic degenerations, toxic hemorrhage and a hematogenic perivascular encephalitis. Possibly the reticulo-endothelial system has previously been taxed by subclinical staphylococcal infections and is therefore more easily blocked by the vaccine virus, or these infections have caused an allergic condition, which explains the violent intensity of the tonsillopulmonary infection without more marked local reaction. Occurrence in different countries at certain seasons might depend on epidemic

incidence of infections often subclinical, and the constant incubation time for postvaccinal encephalitis may be explained by assuming that the toxemia does not produce changes in the brain until the function of the reticulo-endothelial system is fully blocked, that is, at the height of the vaccine infection, after ten or twelve days. The effect of the convalescent serum may depend on an unblocking of the reticulo-endothelial system by neutralization of the vaccine virus. In postinfectious or parainfectious encephalitis the infection, instead of the vaccine virus, causes the function blockade. The author hopes that by application of his bacteriologic technic in postmortem examinations other investigators may be able to confirm or refute his theory.

\*Are "Duret Hemorrhages" Diapedesis Hemorrhages and Do They Possibly Require Long Time for Development? O. Berner.—p. 284.

Murder-Suicide. O. Berner.—p. 289.

**Progressive Hereditary Cerebral Leukodystrophy.**—In Forsberg and Strømme's four patients, a brother aged 13 and three sisters aged 7, 5 and 4, spastic phenomena, most prominent in the lower extremities, ataxia of cerebellar type and more or less marked psychic defects were common. A cousin of the maternal grandmother was "queer"; an older sister of the children has spontaneous nystagmus and rigidity of the lower extremities; one cousin has strabismus and another an unsteady gait. Differences in the clinical picture in the cases are attributed to different stages of development. The picture is at present dominated by progressive dementia, increasing rigidity, ataxia and gradually increasing involuntary movements. Different stages of the disturbance cannot be sharply distinguished. The authors' conclusion that this syndrome, because of numerous and essential points of clinical similarity, belongs to the form of heredodegenerative disorders of the brain described by Merzbacher-Pelizaeus is supported by the undoubted heredity, start in earliest childhood and chronic course. As far as they know, the disorder has not before been described in four siblings. In spasticity, ataxia, intension tremor and nystagmus there is a marked resemblance to multiple sclerosis, but the remissions that characterize multiple sclerosis have not been observed.

**Increase in Reticulocytes After Injection of "Anemic" Serum.**—Hjort says that intravenous injections in normal rabbits of serum from rabbits with recent massive hemorrhages produced an increase in the percentage of reticulocytes in one third of the cases, the rise and course resembling those after massive loss of blood. In the remaining two thirds of the cases there was either a slight increase or a slight decrease in the number of reticulocytes. "Anemic" serum from the same donor injected into two different recipients caused a noticeable rise in the reticulocyte count in one and a decrease in the other. The marked increase in reticulocytes in one third of the cases was not accompanied by a corresponding increase in the total number of red corpuscles.

**Are "Duret Hemorrhages" Diapedesis Hemorrhages?**—A woman, aged 58, was struck by a bus and immediately taken to a hospital under the diagnosis of concussion of the brain, but she died before arrival. Berner found macroscopically clear and typical Duret hemorrhages in the fourth ventricle. He states that the patient had lived at the most fifteen minutes after the accident and that his picture demonstrates that diapedesis hemorrhages can become visible to the naked eye in that time, and, further, that without a lesion of the head, fracture of the skull or injury of the brain itself, as in this instance, the hemorrhage in the fourth ventricle cannot be explained as a rhexis bleeding. He avers that the hemorrhages, by Duret believed always to be rhexis hemorrhages, are predominantly, if not always, diapedesis hemorrhages.

## INFLUENCE OF THE DEPRESSION ON THE NUTRITION OF THE AMERICAN PEOPLE

JAMES S. McLESTER, M.D.  
BIRMINGHAM, ALA.

The present-day depression is having a profound influence on the lives of the American people. Which of two groups of factors, the emotional or the material, is most potent it is difficult to say. Unquestionably the former has had a far reaching effect, for disappointment, the destruction of hopes and ambitions, the humiliation that comes with failure, and loss of morale, each has had its influence, sometimes a devastating one. It should not be forgotten, however, that the reverse of this has occasionally obtained and the picture been lightened by the improvement in health and spirits that comes from a simpler diet and slower tempo of life. But what of the material side? What have been the effects of the depression, if any, on the nutritive state of the American people? Have they suffered in this respect, and to what degree?

It seems hardly necessary to point out first of all that the food habits of a person are not determined solely, or even necessarily in large part, by availability of supply. Habit, custom, education and native intelligence all are factors that count. It should be recognized, too, that this question cannot be answered by reference to conditions observed in foreign lands; for in America food is plentiful and relatively cheap, and the hardships of poverty seldom reach the depths encountered in other countries. Our problem is one peculiar to ourselves. To be reckoned with also is the fact that the United States government has been extremely liberal in its appropriations for relief and that social agencies, on the whole, have shown an intelligent understanding of human needs and great zeal in meeting the emergency. Until today I have felt that nutritive failure in America is largely the result of ignorance and faddism. Has there been added to these two factors the further influence of poverty? To answer this question has been the object of this inquiry.

There is no single criterion, universally applicable, by which a person's nutritive state can be judged. Weight, color, endurance, poise and sense of well being all give evidence, but, excepting weight, each of these qualities is difficult to measure in a large scale investigation. For the present inquiry, therefore, especially as it applies to children, it would appear that, in the absence of edema, body weight is the most widely applicable criterion. The discussion that follows will

be concerned largely with four pieces of evidence: (a) the weight and the increment of gain among school children as recorded before and during the depression, (b) the weights of the employed and unemployed among working men, together with estimates of fitness, (c) the testimony of welfare agencies, and (d) the clinical observations of a selected group of physicians.

### NUTRITION IN CHILDREN

Since the effects of nutritive deprivation are felt most heavily by children, it is among these that one expects to find the most graphic evidences of food shortage. To recognize the truth of this one has but to recall the plight of the children of the central empires during the World War. It is interesting, too, to note that these effects are still being felt, for as evidence that an inadequate diet during the earlier years may produce a lasting effect on the child's stamina it is reported that among a large group of Berlin school children progress in school was not as good among those born during the years when the food shortage was greatest (1917-1919) as among those born in years of less hardship.<sup>1</sup> Even today in Austria the economic crisis is felt most profoundly by the children, as was indicated in the recent statement of Gottlieb and Stransky<sup>2</sup> that, among 800 school children studied by them, those of the unemployed showed an especially large number to be underweight.

Conditions more nearly comparable to our own, however, can be looked for in the other English speaking countries. In England the picture is definitely brighter than on the continent, as was shown by the statement of the minister of health in the house of commons in 1933 that unemployment had exercised no unfavorable effects on the nutrition of the workers and that there was a remarkable decrease in the death rate of children. This achievement he credited to the country's health services.<sup>3</sup> Coming closer home, still more encouraging conditions are to be found in Canada. Tisdall,<sup>4</sup> writing from the subdepartment of pediatrics of the University of Toronto, states that the impression he has gained from the 86,000 attendances on the outpatient department of the Hospital for Sick Children is that the patients are just as well fed, if not better, than before the extensive relief now in force was started. Miss Redmon, director of nutritional teaching of the Toronto department of health, believes that the middle class, whose salaries have been rigidly cut, are suffering from lack of proper food; but Tisdall, while questioning the adequacy of relief diets for older children, believes on the whole that the indigent children of Toronto are

4. Tisdall, F. F. Personal communication to the author.

better fed now than ever before. Hutton,<sup>5</sup> medical officer of health of the city of Brantford, Ont., reports that the number of underweight school children has fallen from 8 per cent in 1925 to 5 per cent in 1935, and states that it is his impression that there are less nutritional disorders in that city than in normal times. The available evidence, then, would indicate that the nutritive state of the Canadian child has not suffered.

Turning to the United States, there are a number of reports of carefully conducted surveys that tell of the effects of the depression on the nutritive state of the American child. The observations of Kiser and Stix<sup>6</sup> on 540 children of New York's lower east side, and the data collected by Eliot and Burritt<sup>7</sup> of the Children's Bureau from a number of large American cities, suggest to each of these investigators that there is a recognizable increase of malnutrition among children. Diametrically opposed to these views, however, are the conclusions of Palmer,<sup>8</sup> consultant in child hygiene to the United States Public Health Service. This physician in his studies of the growth and weight of 2,500 school children of Hagerstown, Md., with special reference to the years of the economic depression, found that "averages of weight of children from 6 to 11 years of age did not differ significantly in 1933 from similar averages based on weights recorded during 1921 through 1927." He observed that the variability in weight was substantially the same in 1933 as in the earlier period, with a probable exception in the group of younger girls, who showed a slight increase in the proportion of underweight. It is interesting to note that in subsequent studies<sup>9</sup> it was found that the children of those families which changed from a relatively comfortable to a poor economic state, the "depression poor," so called, were the ones most often affected. In his investigation of differences in the weight of children from the various economic classes Palmer found that, in spite of the marked economic changes that have recently occurred, approximately the same class differences exist today as were observed in normal times. These extensive studies can be summarized by the statement of this investigator that "the recent economic depression has not materially affected the growth in weight of a representative sample of school children."

A critical review of the studies of Palmer and others was offered by Eliot,<sup>10</sup> who drew conclusions somewhat at variance with those stated. She expressed concern regarding the present and future growth and development of the five or more millions of children affected by the depression and believes that the depression is having an adverse effect on the health and nutrition of many of these children.

From San Francisco comes a report of the studies of Geiger,<sup>11</sup> which differed from Palmer's studies in that they were confined solely to children on relief. Taking 10 per cent or more deviation from the normal as a criterion of underweight, this investigator found that among 4,500 such children 11 per cent of the

school group and 5 per cent of the preschool group were underweight, which figures compare favorably with the control group of children not on relief, who showed 13 per cent and 8 per cent of underweight respectively. Geiger states that even a conservative interpretation of these observations leads one to the conclusion that the nutritional status of children who have been on commissary relief compare very favorably with a normal or even a more privileged group in the community.

In an effort to secure information from a still larger group of children, I have examined the height and weight records made in 1927 and in 1934 of approximately 20,000 pupils (19,891) of the Birmingham public schools, representing essentially 25 per cent of the total enrolment for the two years. This is an industrial city the population of which has profoundly felt the effects of the depression, and in selecting the school from which these figures were taken I have chosen those lying in industrial areas. The figures were taken from the regular health cards that record height and weight measurements made in a routine manner twice yearly and for the two periods represent identical age groups. The weights include clothing. The results of this study may be briefly summarized as follows:

As to heights, white schools showed that the median heights ranged from  $\frac{7}{10}$  inch to  $2\frac{1}{10}$  inches (0.5 to 5.1 cm.) more in 1934 than in 1927, an average gain for the depression period of  $\frac{7}{10}$  inch (1.8 cm.).

Negro schools showed that the median heights in 1934 ranged from  $\frac{7}{10}$  inch (2.28 cm.) below to  $1\frac{1}{10}$  inches (2.6 cm.) above the medians in 1927, or an average for the depression period of  $\frac{1}{10}$  inch (0.25 cm.) less.

As to weight, white schools showed that the median weights were the same to 1 pound (450 Gm.) greater in 1934 than in 1927, an average for the depression period of  $\frac{2}{10}$  pound (90 Gm.) greater.

Negro schools showed that the median weights in 1934 ranged from  $\frac{9}{10}$  pound (360 Gm.) below to  $\frac{1}{10}$  pound (180 Gm.) above the medians in 1927, an average for the depression period of  $\frac{2}{10}$  pound (90 Gm.) less.

To explain why the median height of the white child was  $\frac{7}{10}$  inch greater and that of the Negro child  $\frac{1}{10}$  inch less following the depression than in an earlier period requires conjecture which finds no place in this report. The difference in median weights was so little as to require no comment, being for the two periods  $\frac{2}{10}$  pound greater in the white schools and  $\frac{2}{10}$  pound less in the Negro schools. As between the two races, when one considers the differences in economic status and particularly the very marked differences in degree of enlightenment, I think that one can be satisfied that the less favored race has been well taken care of. On the whole I believe that these figures warrant the assumption that during the depression the children in an important industrial area of a large American city have not suffered in the state of their nutrition.

#### NUTRITION OF WORKMEN

The extent to which the nutritive state of the American working man has suffered during the depression is not so easy to determine. The medical director of one of the largest industrial plants in the East writes that while he has no definite figures bearing on this question he recalls having seen a number of cases of nutritional disturbance. He comments on an increased tendency toward accidents in some of those employees who have been off for appreciable periods of time,

which he is inclined to attribute to mental lethargy. Whether this mental lethargy is due to poor nutrition or to other causes is a matter for conjecture, but it is interesting that the medical director of one of the Southern plants has noted the same thing, which he ascribes to the obvious fact that the men first laid off were those who were least efficient and of a lower order of native intelligence.

A physician responsible for the health of the employees and their families of one of the largest industrial plants in the South tells me that those employees of his company who have been idle, and therefore on relief, show no more evidence of nutritive failure or lack of efficiency than is seen among the men who have had steady employment, but he reminds me that his company has maintained the same watchful interest over the families of the men who have been laid off as is shown to those who are kept on the rolls and that the public relief given the former group has been materially supplemented from the company stores.

For the present investigation, therefore, another plant was selected in which such supplementary relief measures were not applied. The weight in relation to the height of the men who recently applied to this company for employment, and who therefore were assumed to have been idle for varying lengths of time, were compared with similar data obtained from those who have had steady employment. Eight hundred and thirty-nine men, all of them stripped, were weighed on the same pair of balanced springless scales. Weights were compared with the normal for height and age, and each man's "percentage of normal weight" was determined. Because these men were weighed without clothing, the scale adopted was 5 per cent lower than the Metropolitan Life Insurance Company's table for men with clothing. The men were divided into two groups: "old" employees, who had worked for the company more than three months, and "new men," who had worked less than three months. In the latter group were included also those men who were examined for employment but were declined. A small number of the "new men" had come directly from some other job, but most of these had worked only sporadically on a part time basis; many of this group were on relief. There was no noteworthy difference in the weights of these two groups. It is recognized that this investigation of working men leaves much to be desired and that far-reaching conclusions are not warranted; but it is believed that these figures suggest that the nutrition of the men out of work, many of whom were on relief, was not recognizably inferior to that of the men who have enjoyed continuous employment.

#### THE SOCIAL ASPECT

Turning to another aspect of this question, social workers and those in charge of relief and other health agencies have provided a number of reports; but because the worker has as a rule focused his vision sharply on those people most in need of help, a group which cannot be regarded as a fair sample of the population, such reports are not always suited to the present purpose. An excellent view of this aspect of the picture is given by Eliot in her critical review, to which reference has just been made. She sees the more sober tones and believes that the effect on children of inadequate food, too little medical care and lack of security is becoming more and more apparent. Miss Raymond, director of the department of public welfare of New Orleans, states that almost all those who apply for relief, or at least the majority, are undernourished.

She comments, however, on the fact that the regular relief furnished families throughout the state resulted in marked improvement in health conditions among these families to such an extent that in their local communities the appearance of such families was the subject of frequent comment. Miss Wisner, director of the school of social work of Tulane University, expressed the belief: "First, that in the city of New Orleans, where the cost of living is higher and the relief budget relatively less adequate, there has been widespread malnutrition as a result of the depression; second, that in the rural areas, where the relief budget has not in all cases been adequate but where it has been accompanied by such supplementary services as the nutritional program and the medical program of the E. R. A., health conditions in the families have been as good and even better, in some cases, than formerly." Referring to the educational effect of these measures on the tenant farmers and share croppers of Louisiana, who formerly lived wholly on a diet of meat, meal and molasses, she writes: "several of the parish workers report that, as a result of the nutritional program, some of the [plantation] commissaries have had to stock themselves with a wider variety of food products as a result of changing food habits of the people."

Many case histories included in the reports of welfare agencies tell of instances of great destitution and of pitiable suffering. As in all other countries, destitution has always been a part of the picture of American social life and perhaps today stands out more prominently than ever before, but to what extent it colors the entire painting it is difficult to say. My observations incline me to believe, under the fortunate circumstances in which we find ourselves in America, that it occupies a relatively inconspicuous corner of the picture.

#### THE MEDICAL ASPECT

The most revealing testimony that I have to offer comes from a selected group of twenty-five observant physicians interested in nutrition who live in different parts of the United States. Their replies, an abstract of which I quote, impress me as showing a significant agreement of opinion.

From New York, Du Bois writes that prior to 1932 in his service at the Bellevue Hospital he gathered the impression that the poor people were showing the effects of the depression and that there was an increasing number of patients with the milder forms of dietary deficiency. He saw few cases of scurvy and none of frank beriberi, but there was an occasional case of nutritional edema. In subsequent years at the New York Hospital he has seen a few cases of pellagra, of scurvy and of nutritional edema but does not think that the number of these is disproportionately large. In watching the people on the streets of New York during the past three years Du Bois has been rather struck with the absence of beggars, tramps and other manifestations of poverty. Spencer, drawing on his more recent experience in the same service at Bellevue Hospital, states that during the earlier days of the depression he had a definite feeling that there was a marked increase in deficiency states but that more recently he has observed in the population of that hospital evidences of better nutritional care. He adds: "While I believe there was, and possibly still is, an increase [in nutritive failure] compared with the predepression situation, I feel also that many of us were letting sub-clinical deficiency states slip by unnoticed; hence I do not feel like being too dogmatic about the relationship of the depression to the incidence of malnutrition."

Harlow Brooks wrote that because of better organization of the relief agencies there is not much increase in malnutrition in New York today. Crohn states that the people "all look well nourished" but emphasizes the far reaching effects of psychic and emotional factors in the production of functional disorders.

Christian, writing from Boston, states that for the first time he has seen in the wards of the Brigham Hospital people in actual partial starvation, and he calls attention to the fact that the physician's therapy is sometimes handicapped by the inability of the patient to buy the right food. Fitz states that only rarely has he seen people who have suffered from lack of food as a result of the depression and that most of the people, including middle class and indigent people, have continued to hold their weight level at rather too high than too low a figure. He emphasizes the influence of self-induced abnormal diets rather than lack of food in the production of pellagra and other deficiency states. Soma Weiss made an analysis of all the records of the Boston City Hospital bearing on this subject, from which he concluded that, while deficiency diseases are not uncommon in New England, such diseases are seldom due to lack of money but rather to other causes. He has the impression that in view of prevailing relief measures, food deficiencies are no less common than formerly. An interesting report comes from Root of the same city, who tells of a group of boys in a crowded tenement district whom he has examined systematically from time to time during the past fifteen years, and of his more recent studies of these boys. He writes: "The families were all poor, some of them very low in intelligence, but they were under the influence of a settlement house and therefore had the benefit of their friendly interest. To my great surprise, these boys had grown in height and weight as a group just about according to the average for that age period, namely, 10 to 16 years, in spite of the very dreadful effect of the depression on the community life of that neighborhood."

From Philadelphia comes the somewhat different report of Piersol, who believes that as the result of the depression he has seen in the wards and outpatient departments a greater number of individuals suffering from undernutrition than he did formerly. He has seen no cases of scurvy or nutritional edema. On the other hand, Rehfuss has gained the impression that, while anxiety incident to financial loss has caused an increase in the incidence of peptic ulcer, a definite improvement in other diseases, notably certain cases of mild arthritis and gallbladder disease, has been brought about by the simpler life and a more restricted diet. In Baltimore, Lay Martin has observed no effect of the present-day depression on the nutritive state of the people; he quotes the heads of other medical clinics as having seen no results that they could interpret as an effect of lowered nutrition due to the depression.

In the West, Spies, writing of his search for nutritional diseases at Lakeside Hospital in Cleveland, states that although loss of weight and other evidences of malnutrition due to lack of food are occasionally observed in the indigent groups, it is his impression that the number of such cases has increased but little, if at all. The malnutrition that he has seen in the middle and well-to-do classes he has been able to trace, as a rule, to alcoholism or food faddism. He has seen no increase in the incidence of pellagra, and although he has been on the lookout for scurvy he has found only one such case. Haden, in writing of the more favored economic class, states: "We have seen many

cases of nutritional deficiency disease here because we have been interested in it and on the lookout for it, but I think the economic status of these patients has had relatively little to do with the development of this deficiency disease." John of the same city has seen no appreciable change in the nutritive state of his patients. In Chicago, Barborka has been more impressed by the inadequacy of the diets, especially as regards protein and by faulty food habits of the people than by actual nutritive deprivation. Soper of St. Louis has been more deeply impressed by the anxiety neuroses displayed by his patients than by the effects of inadequate food.

At the Mayo Clinic, Alvarez states that he has not been able to detect any increase in malnutrition, and Eusterman writes that he does not think that they have seen very much malnutrition or many frank or sub-clinical types of dietetic deficiency during the depression; he believes that in some respects the nutritional status of the kind of patient seen at that clinic has improved. The observations of Geiger in San Francisco have already been discussed. Bloomfield from the same city writes: "I have seen no notable impairment of nutrition that could be attributed to the depression. Such nutritional disorders as we have seen have come largely as a result of restriction of diet through quackery or disease, and not because of inability to get food."

In the South, where nutritional failure is believed to affect a disproportionately large part of the population. Musser writes from New Orleans that, while faulty dietary customs in certain regions of Louisiana have always sent to the Charity Hospital a few cases of beriberi, pellagra and other nutritional diseases, he has seen during the depression no increase in the incidence of these diseases. Turner, from the same clinic, states that his only observation in this respect is that in the last two years there has been a sharp diminution in the number of pellagrins. Paullin of Atlanta, from his wards in the Grady Hospital, writes that he has seen fewer cases of deficiency disease than he did before the depression, that there has been a steady decrease in the incidence of pellagra and that the only cases of malnutrition he has seen were directly traceable to disease and not to lack of food. This expresses very well my experience and that of my colleagues in Birmingham. There was a peak in the pellagra admissions to the Hillman Hospital in 1929 and again in 1932, but since then this disease has been on the decrease. In the adult wards we have recognized no scurvy or beriberi. The general nutritive state of the patients coming to the wards of the hospital and to the outpatient department appears to be fully as good as that observed in years past. This applies also to the people whom I see on the streets. From Duke University in North Carolina, Hanes reports an increase in the number of cases of sprue, but he is inclined to attribute this to the live interest in this disease which in recent years has developed at that clinic. From Vanderbilt University, Youmans, whose studies of nutritional edema in Tennessee are well known, writes that the vast majority of patients seen in that clinic appear to be a little better nourished today than formerly. He feels that this is due to the fact that with the introduction of general relief many of these people have a somewhat better dietary than before, and that through education and necessity a change for the better in their dietary has been forced on them. Even among the "depression poor" he has seen relatively little malnutrition. He has seen no increase in outspoken scurvy and an actual

decrease in the incidence of pellagra. He adds that he is today seeing only a few cases of frank starvation, while prior to 1930 such cases were relatively numerous.

The physicians who have been quoted express opinions that approach unanimity. With only an occasional exception the answer has been that the physician sees today no more nutritive failure among his patients, whether indigent or more fortunate, than he saw in years past, and that by and large the present-day depression has had no recognizable effect on the nutritive state of the American people.

#### COMMENT

It is significant that this investigation has revealed no evidence of undernutrition in the American school child. To explain this there are perhaps many reasons, prominent among which are, first, that the parent who feels the pinch of necessity is now giving greater thought than ever before to the welfare of his child; second, that in the past five years the lunch rooms of public schools have undergone rapid development, and, third, that welfare agencies have been keenly alive to the hazards confronting the American child and have been highly efficient in meeting them.

Above all else one thing seems to me to be clearly revealed by these studies; that is, the value of enlightenment in nutrition. The American people during the past five years have suffered great material losses; a large part of them have been forced to economize in a most rigid manner, and another group have had no means with which to buy the necessities of life. The last have been forced to depend on government subsidies. Yet there is no clear evidence that the nutritive state of any appreciable number of people is inferior to that of predepression days. Most striking is the fact that the very people among whom one expects to find extensive undernutrition are on the whole in good condition and in many instances in better nutritive state than in an earlier period. What is the explanation? Education. While there are notable exceptions, the persons who drop first to the bottom of the economic scale are those who show the least efficiency in making progress in the world, in which lack of efficiency is included the choice of food. Most of them have always been guilty of dietary faults, and many were living on the verge of starvation. Then came the depression and the reorganization of the welfare agencies, and with these agencies material help and insistent advice as to what to eat. Thus not only was starvation forestalled in a large group of people but in some instances the nutritive deficiencies of years were corrected.

#### CONCLUSIONS

1. In the present-day depression the nutritive state of the American school child has not suffered.
2. There is no widespread undernutrition; the general population as a whole seems to be as well nourished as formerly.
3. Although no doubt there are many exceptions, the vigor of the American working man is not recognizably inferior to that of earlier years.
4. The incidence of deficiency diseases, such as pellagra and nutritional edema, possibly increased somewhat during the first years of the depression, but such diseases are today decreasing markedly in number.
5. Relief agencies have done a good job; the educational influence of their work has added greatly to its effectiveness.

930 South Twentieth Street.

## LYMPHOPATHIA VENEREUM

WITH SPECIAL REFERENCE AS TO DIAGNOSIS

R. M. THOMPSON, M.D.

Captain, M. C., U. S. Army

FORT SAM HOUSTON, TEXAS

Epidemic, infectious, subacute inflammation of the inguinal lymphatic glandular structures has long been recognized in different countries and has been described under a large category of names, many of which are confusing, inaccurate and ambiguous. It is the present consensus that this lymphatic node syndrome should be termed so that there will be no doubt as to its true entity; partly for this reason, one finds such synonyms as "lymphogranuloma inguinale," "tropical or climatic bubo," the "fourth venereal disease" and "Nicolas-Favre's disease" in the literature. Other reasons for the multiplicity of names lie in the fact that there is confusion as to the true concept of the disease, it being often mistaken or linked with lymphogranulomatosis (Hodgkin's disease) and other of the more common lymph node disorders such as granuloma inguinale (granuloma venereum-granuloma pudendi). Of all the various names given to this definite clinical and more or less pathologic disease entity, I favor the term "lymphopathia venereum" as suggested by Wolf and Sulzberger<sup>1</sup> and will use this name throughout this paper. The term "lymphopathia venereum," if universally adopted, will lead to less confusion, will give a more accurate conception of the disease, and yet will embrace the various extra-inguinal localizations that are now recognized as being of identical etiology.

#### HISTORY

This disease per se is by no means a new one, for as long ago as 1859 Chassaignac<sup>2</sup> described inflammations of the groin which pictured in many respects similarities of the present conception of lymphopathia venereum. Velpeau<sup>3</sup> (1865), Nélaton<sup>4</sup> (1890), Brault<sup>5</sup> (1894), Marion and Gandy<sup>6</sup> (1901), Tanton and Pigeon,<sup>7</sup> Rost<sup>8</sup> and many other authors subsequently described the same condition, which Hellerström<sup>9</sup> so adequately discussed in his monograph in 1929. In 1913 Durand, Nicolas and Favre<sup>10</sup> promulgated their articles and set forth the true infectious epidemic nature of the disease, describing its principal symptom complex and evolution under the term "lymphogranulomatose inguinale subaigue." Since then many foreign writers have elected to use "Nicolas-Favre's disease" when speaking or writing on the subject. With the exception of the past five years, little has appeared in the American literature on this interesting disease, although there have been numerous foreign promulgations. There have been a few cases described in the *United States Naval Medical Bulletin* since 1913 as having originated in the tropics. These were reported under the name of "tropical or climatic bubo." Hansmann<sup>11</sup> in 1924 reported four cases under the term

1. Wolf, J., and Sulzberger, M. B.: *Lymphopathia Venerea*, Brit. J. Dermat. & Syph. 44: 192 (April) 1932.
2. Chassaignac, E.: *Traité pratique de la suppuration et du drainage chirurgical*, 1859, p. 354.
3. Velpeau: *Adenitis*, in *Dictionnaire encyclopédique des sciences médicales*, Delorme and Deschambres, 1864.
4. Nélaton, A.: *Semaine méd.* 10: 402, 1890.
5. Brault, J.: *Lyon méd.*, 1895.
6. Marion, G., and Gandy, C.: *Arch. gén. de méd.*, 1901.
7. Tanton and Pigeon: *Arch. gén. de méd.*, 1908, pp. 76-125.

10. Durand, M.; Nicolas, Joseph, and Favre, M.: *Bull. et mém. Soc. méd. d. hôp. de Paris* 33: 274-288 (Feb. 6) 1913.
11. Hansmann, G. H.: *Surg., Gynec. & Obst.* 39: 72-82 (July) 1924.

"nontuberculous granulomatous lymphadenitis." Frei<sup>12</sup> in 1925 proved the disease entity when he discovered the intradermal test, now referred to as the "Frei test." Barber and Coogle<sup>13</sup> in 1927 reported a few cases and designated them under Hansmann's terminology. In 1928 a case with autopsy was reported by Hillsman, Wilshusen and Zimmerman.<sup>14</sup> Since 1930 the American literature has teemed with references, and foremost

Fig. 1.—The parietal lymph glands of the pelvis with special reference to the lymph drainage from the vaginal vault and cervix.

of these articles are those published by DeWolf and Van Cleve<sup>15</sup> of Cleveland, Sulzberger and Wise<sup>16</sup> of New York, Bloom<sup>17</sup> of New York, Cole<sup>18</sup> of Cleveland and Lehmann and Pipkin<sup>19</sup> of San Antonio, Texas. The latter are undoubtedly responsible for the sudden rise into prominence of lymphopathia venereum in America.

There is no doubt as to the prevalence of this infection in the United States, and, quite contrary to past belief, it occurs with about the same frequency in the temperate and subtropical climates as it does in the tropics. Undoubtedly in the past the failure of true recognition was the inability of the physician to diagnose the condition properly.

#### CLINICAL PICTURE

Lymphopathia venereum is a specific, epidemic, indolent infectious disease due to a specific filtrable virus which is transmissible through the medium of sexual intercourse, for which reason many have termed the condition the "fourth venereal disease." In view of the fact that the venereal origin of this disease has been so well established and the frequency and social importance so clearly understood, Reiter<sup>20</sup> in March 1935 stated that steps had been taken in Germany to have the law of Feb. 18, 1927, for the control of venereal diseases, apply to this clinical entity.

This infection affects young adult males more often than females and is characterized as a subacute, resistant inflammation of the inguinal lymph glands, often resulting in suppuration, abscess formation and chronic fistulation, with a tendency toward healing by retractile scarring and fibrosis. The incubation period, according to Hellerström,<sup>21</sup> is from ten to thirty days and dates from the time of exposure to the appearance of lymph gland involvement. Because of anatomic differences in male and female lymphatic structures, as noted in figure 1, superficial and intermediate inguinal disorders in the female are the exception rather than the rule.

The lymph drainage of the male genitalia is directed almost entirely into the inguinal lymph nodes and then

Fig. 2.—Unilateral inguinal adenopathy or bubo, with variations of positive Frei reactions (forty-eight hours).

into the deep iliac nodes. Therefore, when the initial lesion is on the external genitalia these nodes will become affected. In the female the anatomy of the lymph drainage is quite different. Only the lymph from the vulva is directed into the inguinal lymph nodes, while the lymph from the vagina and cervix

drains into the lymphatics around the rectum. This explains the frequent dissimilarities of the disease in the two sexes.

In women the disease more often presents itself in the deep pelvic and perianal lymphatics, and so the later manifestations are more commonly seen. After running an indolent, chronic course, the disease resolves itself into esthiomene (chronic ulceration of the vulva with elephantiasis and sclerosis), and the genito-anorectal syndrome (anorectal syphiloma with stricture of the bowel). There may be no subjective symptoms in the female during the active stage of the infection until the appearance of the later manifestations. In men a late manifestation may be elephantiasis of the penis and scrotum, which, according to Stryker and Ploch,<sup>22</sup> is more likely to occur in cases in which the collateral circulation has been disturbed or in which the entire regional lymph system becomes involved in the pathologic process.

**Primary Lesion.**—A careful history and physical examination will elicit the presence of a primary sore in about 50 per cent of cases. Hellerström,<sup>21</sup> in his report of forty-seven cases, states that there were primary lesions in twenty-two. Cole states that in thirty-seven cases of acute infection he noted primary lesions in sixteen. Kimbrough and Lavery<sup>23</sup> have observed a relatively high percentage of primary lesions. This may in part be due to the fact that military personnel are more "venereal minded" than civilians because of the frequent venereal inspections and the consequences that accrue from the attainment of venereal disease.

The history of a small, painless, nonindurated lesion on the genitalia, appearing from three days to three weeks after intercourse, and which rapidly disappears in from five to ten days, followed by inguinal glandular involvement, should immediately lead one to surmise the advent of lymphopathia venerea. Because of the fact that the primary lesion may be so small (often pinhead in size), painless and lasts for so short a time, this part of diagnostic evidence is often overlooked by the patient. This primary erosion is usually dry with sharply defined edges and in the male usually presents itself on the glans penis or prepuce. In the female the portal of entry is often difficult to determine, and primary lesions of the external genitalia are rare. When they do occur, they present themselves in the region of the fourchette and the vagina. Many of the female infections undoubtedly occur through the vagina or cervix, in which case primary lesions would be unnoticed. Phylactos<sup>24</sup> describes four types of lesions which may occur on the glans, prepuce, and like locations: (a) ulcerated type, (b) nodular type, (c) papular type and (d) lymphogranulomatous urethritis. These lesions may occur singly or in multiples. Pseudoherpetic lesions have been described.

As in syphilis, unnatural primary lesions of lymphopathia venereum have been noticed. Curth reported a case of a primary lesion on the tongue, followed by cervical adenitis, and Hellerström gives a history of a surgeon who contracted the infection on his finger while operating on a bubo, followed by typical symptoms.

**Adenitis.**—The onset of the disease is rather insidious and favors the appearance of a systemic infection resembling the symptoms so commonly noted in cases

of a mild septicemia. A few days prior to the swelling of the lymph nodes, the patient suffers from slight headache, anorexia, dorsolumbar pains and generalized discomfort. These symptoms are followed in a few days by an inflammatory involvement of the lymph nodes. In men the first glands to be affected are those of the superficial group in the inguinal region, either the pubic glands or the medial group of the proximal subinguinal lymph glands, which lie in close proximity to Poupart's ligament. The disease progresses very slowly and extends from gland to gland, finally producing a periadenitis. Swelling of the glands is constant and variable, and tenderness becomes more pronounced as the swelling increases. The skin over the glands becomes reddened and, as the periadenitis develops, it becomes attached and fixed down. At this stage, matting of the glands is elicited. As the disease progresses, usually after five weeks from the onset of symptoms, the iliac glands become involved, and at this stage the skin over the affected glands takes on a purplish hue. The latter development of events has been considered pathognomonic by many authors, more particularly the French.

Fig. 3.—A mass of extirpated lymph glands of the inguinal region showing the matting and package effect of the granulomatous mass, and the presence of multiple, intercommunicating abscesses

Along with the gradual development of periadenitis, chills, fever and night sweats are generally noted, with an occasional accompaniment of erythema nodosum. There also develops a moderate leukocytosis, varying from 10,000 to 12,000, with a definite increase in mononuclears. Eosinophilia is constant. Walking becomes more and more difficult, even though pain is not an outstanding symptom.

Eventually softening of the glandular masses occurs and definite fluctuation is noticed. This is usually followed by the appearance of one or many fistulas, which become intercommunicable. These interfacing channels give the affected area the usual honeycomb appearance. Thick, viscid, creamy, yellow pus may exude for a long period, which later becomes sero-sanguineous. Systemic symptoms often disappear long before the fistulas cease draining.

As the fistulous channels develop, and as the disease progresses to the granulomatous stage, the skin becomes folded and thickened, beneath which the matted masses of glands can be distinctly felt. The duration of the process is quite variable, as is also the symptom complex and the severity of the disease. The infection may last from one to several months. Healing, when it does occur, takes place by fibrosis and scar retraction.

Kitagawa<sup>25</sup> of Japan in 1934 reported thirty-seven cases of this interesting disease and stated that he examined the spinal fluid in thirty of the cases, finding the pressure in all of them abnormally high. The Wassermann reaction was positive in the spinal fluid in three cases, with a positive Meinicke reaction in six. The colloidal gold reaction was positive in practically every case.

Kitagawa also found a constant peripapillary edema and tortuosity of blood vessels. These changes have not always been found in other cases reported but suggest a general infection involving the nervous

Jersild,<sup>27</sup> Frei and Koppel,<sup>28</sup> Stannus,<sup>29</sup> and recently Bloom,<sup>17</sup> it is now definitely established and accepted that esthiomene, anorectal syphiloma and the benign rectal strictures are more or less identical with regard to their etiologic agent, being due to the virus of lymphopathia venereum. Wien, Perlstein and Neiman<sup>31</sup> have reported a case of the rectal syndrome of lymphopathia venereum that came to autopsy. Reichle and Connor<sup>31</sup> have described a case of lymphopathia, with autopsy, which also showed involvement of the retroperitoneal lymph nodes, hip joint, adrenals and kidney.

#### DIAGNOSIS AND DIFFERENTIAL DIAGNOSIS

A most careful history and physical examination, together with the positive diagnostic test of Frei, are paramount to the correct diagnosis of lymphopathia venereum. The elicitation of an evanescent primary lesion on the genitalia, followed by a subacute and chronic inflammation of the lymph nodes in the groin, should at least make one suspicious of the condition.

The discovery by Frei in 1925<sup>12</sup> of the specific diagnostic intradermal test, which has been given his name, has greatly simplified the establishing of this clinical disease entity and has paved the way for all the successful research that has since been done in linking these various syndromes under one disease entity.

The Frei test is extremely sensitive and most reliable. According to Wise and Sulzberger,<sup>10</sup> the Frei reaction, if properly interpreted, is one of the most specific test substances in immunologic use. The material for the test is easily procured, provided one has an active case of lymphopathia venereum at one's disposal, and the manufacture of the antigen along with the performance of the test is most simple to do.

Pus from an unopened gland is obtained by aspiration under sterile conditions and is diluted with from five to ten parts of physiologic solution of sodium chloride. This material is then heated at 60 C. for two hours one day and at the same temperature for one hour on the following day. The antigen is then cultured for sterility. For testing purposes, 0.1 cc. is injected intradermally and the reaction is read at the end of twenty-four, forty-eight and seventy-two hours. In patients with the active disease, and also in those who have convalesced, a positive reaction develops in twenty-four hours, which persists for several days. A positive test consists of an inflammatory papule, red and indurated, which is often surrounded by a dull red areola. In some cases, pustulation and even gangrene formation occurs after the papular formation, and this can best be explained by the presence of a hypersensitive patient or hypersensitive antigen. The test is so sensitive that rarely does it become necessary for one to restandardize the antigen or to cross-check the patient. False positive reactions are extremely rare; however, in a very small percentage of true cases of lymphopathia venereum one occasionally notes a negative reaction. According to Sulzberger and Wise<sup>16</sup> there is a definite immunologic relationship between syphilis and lymphopathia venereum, and in some cases of mixed infection one occasionally notes a negative Frei test. However, after antisyphilitic treatment a

Fig. 4.—Section of an infectious granuloma with abscess formation. Small, irregular abscesses are seen with a palisade-like arrangement of epithelioid cells around their edges. The small arteries show sclerotic changes.  $\times 36$ .

system. It is questionable whether all authors reporting cases of lymphopathia venereum have examined spinal fluid and eyegrounds.

The late manifestations or sequelae, previously mentioned, may appear years later. As the disease proceeds from the subacute to the chronic, such conditions as esthiomene, elephantiasis of the vulva, penis and scrotum, and rectovaginal "syphilomas" may appear, all of which are directly due to localization of the process or to the impediment of lymphatic drainage from retractile scarring and the like.

The relationship of lymphopathia venereum to the problem of esthiomene and the production of inflammatory stricture of the rectum was described for the first time by Huguier<sup>26</sup> in 1848. With the original work of

repetition of the test will usually yield a positive. The Frei test is usually positive from ten to twenty-one days following the appearance of the adenitis, at which time the allergic state has developed. Possibly a positive test may be obtained in a patient with a previous disorder, while the present infection may be of an entirely different infection. As stated, false reactions are exceedingly rare and when they happen are usually the result of faulty technic or contaminated antigen.

There are several diseases that may be confused with lymphopathia venereum and at times enter into differential diagnosis, but which are often very easily ruled out. In syphilitic adenitis the lymph nodes are hard and discrete and do not usually break down and suppurate. In this condition a positive serologic reaction and darkfield examinations will solve the situation.

Chancroidal bubo more nearly approaches the true lymphopathia venereum than any other disease. Here a chancroid is usually present and the glandular involvement is usually the complication rather than the accompaniment of the disease. Also in chancroidal bubo the infection is more acute and the suppuration more rapid, with a single large area rather than multiple small areas of fistulation.

The presence of Donovan bodies, with noninvolvement of the lymph nodes, usually separates granuloma inguinale from lymphopathia venereum. Careful bacteriologic and pathologic examinations will rule out the simple pyogenic inflammatory lymph nodes. Hodgkin's disease, malignant growths, tuberculosis, leukemia and fungous infections at times complicate the diagnosis, but again these conditions are most easily differentiated.

#### PATHOLOGY

In a study of twenty-one cases of lymphopathia venereum that have been admitted to this hospital during the past nine months, in which affected glands were removed by surgical excision, it is believed that the pathologic picture is not entirely pathognomonic of the entity but is quite suggestive. The tissue excised is composed of a mass of lymph glands of varying sizes, matted together by a subacute periglandular inflammation. The overlying wine colored or dark purplish skin is firmly adhered to this subcutaneous mass and contains from one to several fistulous perforations, the tracts of which can be followed to intraglandular abscesses or suppurating granulomatous areas. Cut sections of the glands often reveal multiple abscess formations, the pus of which is thick and viscid. In many cases the entire gland appears as a honeycomb, owing to the multiple, irregular and varying sized abscesses. The pathologic condition presented varies with the intensity and duration of the infection. The multiple abscesses almost always show intercommunication, and the normal glandular appearance seems to be replaced by a pinkish gray granulation tissue. There is no evidence of caseation.

Histologically the principal picture is that of a subacute or chronic infectious granuloma with multiple abscess formation, the abscesses varying greatly in size and shape. Pseudogummas also are noted. The normal lymph node structure appears to be replaced by a diffuse granulomatous hyperplasia, composed of lymphocytes, plasma cells, epithelioid cells, fibroblasts and an occasional multinucleated giant cell of the Langhans type. The individual follicles or nodules appear lost. Congestion appears prominent, as does also new blood vessel formation. Sharply demarcated from the hyperplastic surrounding pulp are numerous

necrotic areas of varying size and shape, which appear both ramified and discrete. In the center of the abscesses are granular detritus, collections of polymorphonuclear leukocytes and small round cells. Surrounding these centers is a palisading of epithelioid cells and a few mononuclears, and this arrangement is very constant. External to the palisading epithelioid cells, the presence of early fibroblasts with slight reticulum is noticed. The latter condition is noticed about the more discrete abscesses. The capsule of the nodes shows great thickening and consists of dense, moderately hyalinized fibrous tissue. Little evidence of

Fig. 5.—A solitary, small irregular abscess with the characteristic palisading of epithelioid cells about the periphery. The centers of the abscesses contain a granular detritus, collections of polymorphonuclear leukocytes and a few small round cells. External to the palisading epithelioid cells, a few early fibroblasts and reticulum are noted.  $\times 330$ .

inflammation is noticed with regard to the capsule. Many of the small vessels show sclerotic changes. Pyknotic bodies are encountered occasionally, particularly in the abscesses.

#### BACTERIOLOGY AND ANIMAL INOCULATION

Bacterial examinations up to the present time have been entirely negative. Occasionally pyogenic bacteria have been encountered in the pus of lymphopathia venereum, but it has been proved that these organisms play no part in the true etiology of the disease. It is now universally accepted that the etiologic agent is a filtrable virus. De Bellard<sup>32</sup> in 1924 is credited with being the first to perform successful animal inoculation

32. de Bellard, E. P. J Trop Med 29:103 (April) 1926.

by the preputial inoculation of a monkey. Later, Hellerstrom and Wassén,<sup>31</sup> Meyer, Rosenfeld and Anders,<sup>33</sup> Freund and Reiss,<sup>34</sup> and Levaditi, Ravaut and others<sup>35</sup> succeeded in transferring the condition to animals. According to the research of these workers, the virus seems to be filtrable, being capable of passing through Berkefeld and Chamberland filters.

D'Aunoy<sup>36</sup> of New Orleans has recently reported 160 cases, with isolation of the virus in seven and with passage of the virus through animals. Inoculation may be performed in monkeys, guinea-pigs and mice.

Fig. 6.—The structure shown more clearly of a small discrete abscess, its center composition and the palisading of epithelioid cells. This arrangement is very constant in lymphopathia venereum  $\times 705$

According to Sulzberger and Wise, the virus is quickly destroyed at 60 C., and it can be preserved for ten days at a temperature of 3 C. They state that after forty days it loses its infectiousness and does not resist glycerin or drying processes very well. The virus is destroyed easily by the usual antiseptics such as tincture of iodine, mercurochrome solution and dilute solution of sodium hypochlorite.

#### TREATMENT

Numerous remedies have been advocated, but no single remedy is known to have a specific therapeutic value, and, more certainly, no routine treatment can be recommended. The measures selected and resorted to will necessarily depend on a number of factors such as the form, stage of disease, age and economic status of the patient. In cases of suppururation, a combination of radiotherapy with progressive doses of aqueous solution of iodine associated with sodium thiosulfate is advocated. Sézary and Facquet<sup>37</sup> suggest intramuscular injections of a trivalent antimony salt of thiomalic acid.

It is now generally accepted that surgical excision of the superficial inguinal glands and fistulas is the therapeutic measure of choice in all cases of suppurative adenitis. This procedure in almost all cases results in a cure in from four to eight weeks, even though there is involvement of the deep glands. Rousseau and Adamesteau<sup>38</sup> state that there is no more danger of elephantiasis occurring after operation than after other therapeutic measures. Cole, however, recommends only partial extirpation of the affected nodes, because of the possibility of the development of elephantiasis.

Various other therapeutic methods have been advocated; namely, potassium iodide, salts of copper, iron, arsenic, mercury, the administration of gold preparations, injections of emetine, local applications of tincture of iodine, lead solutions and sulfonated bitumen ointment.

My purpose in this paper is to show that lymphopathia venereum is a definite disease entity of venereal origin and has the possibility of grave consequences. It should be handled with the same administrative methods and control as are gonorrhea and syphilis. It is hoped that the medical profession will become more interested in this condition, so that fewer cases will pass undiagnosed. The problem is more than a dermatogenito-urologic one, for it involves greatly the field of internal medicine, surgery, radiology, clinical laboratory medicine and pathology. With regard to this disease, the surface has only been scratched as far as present knowledge is concerned, and with the proper stimulation and interest on the part of the medical profession at large much will be attained.

#### SUMMARY

1. Lymphopathia venereum, often termed lymphogranuloma inguinale, climatic bubo, and so on, is a specific venereal disease caused by a filtrable virus. The term "lymphopathia venereum," as suggested by Wise and Sulzberger, is advocated because it is less confusing and will embrace the associated extra-inguinal disorders that are a part of the disease entity.

2. The disease is characterized by the appearance of an evanescent primary lesion, often overlooked, followed by a subacute, indolent, inguinal lymphadenitis, which often produces fistulas. The disease course is chronic, may last several years, and may be quite variable as to both course and manifestations. The early symptoms simulate those of a mild case of septicemia.

3. Because of anatomic difference in male and female lymph drainage, the infection tends to localize, in women, in the deeper lymphatic structures, thus

33. Meyer, Kurt; Rosenfeld, Herbert and Anders, H. E. *Klin. Wchnschr.* **10**: 1653 (Sept. 5) 1931.

34. Freund, Helmut, and Reiss, Franklin. *Klin. Wchnschr.* **10**: 1658 (Sept. 5) 1931.

35. Levaditi, C.; Ravaut, P., Lepine, P. and Schoen, Mlle. R. *Bull. Acad. de med., Paris* **106**: 331 (Nov. 17) 1931.

36. D'Aunoy, R., von Haam, E., Lichtenschein, L. *Am. J. Path.* **11**: 737 (Sept.) 1935.

37. Sézary, A., and Facquet, J.: *Bull. Soc. franç. de dermat. et syph.* **41**: 771 (May) 1934.

invoking the esthiomene and genito-anorectal syndrome. Elephantiasis may be a late sequela to the infection in both male and female.

4. The intradermal Frei test is specific for this infection and remains positive for many years.

5. The pathologic picture, although not pathognomonic, is quite suggestive of this disease entity. Other diseases that may be confused with lymphopathia venereum are most often easily ruled out.

6. The treatment of choice is surgical combined with medical supportive measures. It consists in partial extirpation of the affected nodes, combined with drainage, radiotherapy and the progressive dosage of aqueous solution of iodine and sodium thiosulfate.

7. Geographically, this disease is widely disseminated throughout the world and is not localized in the tropics and seaports. Lymphopathia venereum is not the rarity it is commonly supposed to be.

## EXTRAGENITAL LESIONS OF LYMPHOGRANULOMA INGUINALE

VERNON C. DAVID, M.D.

AND

MARK LORING, M.D.

CHICAGO

In 1913 Durand, Nicolas and Favre<sup>1</sup> differentiated from inguinal adenitis due to chancroid, syphilis and tuberculosis a new venereal disease, which they called subacute inguinal lymphogranulomatosis and which they established as a venereal disease entity. This disease has been variously referred to in the literature as a climatic bubo, tropical bubo, nonvenereal bubo, subacute inguinal periadenitis, fourth venereal disease, strumous bubo of the groin, nontuberculous lymphadenitis, subacute lymphadenitis, malady Nicolas-Favre, hypertrophic bubo and lymphopathia venereum.

The primary lesion on the glans penis, in the vagina or elsewhere may be trivial and evanescent and may entirely escape notice. During an incubation period of from ten to thirty days<sup>2</sup> inguinal adenitis may develop, and this may result in suppuration. In 1925 Frei<sup>3</sup> announced an intradermal skin test, now known as the Frei test, which is characterized by an intradermal nodule appearing from thirty-six to seventy-two hours after injection into the skin of an antigen which is obtained from the pus taken from a suppurating gland of this disease. DeWolf and Van Cleve,<sup>4</sup> who wrote in 1932 the first comprehensive articles on lymphogranuloma inguinale in this country, described the preparation of the antigen and the interpretation of the test in detail. In 1928 Frei and Koppel<sup>5</sup> reported positive Frei reactions in five cases of rectal stricture. Since then Cole<sup>6</sup> and many others have confirmed the importance of the relation of lymphogranuloma inguinale to rectal stricture. In 1930 Hellerström and Wassén<sup>7</sup> announced that they had been able to infect monkeys with the disease by intracerebral inoculation of saline

suspensions of involved gland tissue from a patient with lymphogranuloma inguinale. Meningo-encephalitis resulted after an inoculation of from six to twelve days. They were able to pass the disease through a series of monkeys and maintained that the virus became generalized and that an antigen prepared from the brain, cerebrospinal fluid or lymphatic glands yields a positive Frei test on patients with the disease. In 1931 Hellerström showed that the virus of the disease is filtrable and that monkeys can be infected with such filtrates. In 1932 Ravaut, Levaditi, Lambling and Cachera<sup>7</sup> studied a case presenting rectal stricture without glandular or pelvic lesions and in which no evidence of syphilis, chancroid, gonorrhea or tuberculosis was present. The Frei test was positive. A fragment of rectal mucosa was injected under the skin of a guinea-pig and an adenopathy developed. A piece of the gland inoculated into a monkey's brain gave a typical encephalitis. The presence of the virus in the rectal lesion proves the rôle of Nicolas-Favre disease in the etiology of rectal strictures as well as the specific value of the Frei test.

Surgeons in large charity hospitals see many rectal strictures which are now known to be a manifestation of lymphogranuloma inguinale, but which formerly were called by many syphilis of the rectum. During the past fifteen years of service at the Cook County Hospital one of us (V. C. D.) has seen at least 200 patients afflicted with rectal involvement of what is now known to be lymphogranuloma inguinale. The great

Fig. 1 (case 3).—Biopsy from stricture of rectum due to lymphogranuloma inguinale. This patient later had an ulcer of the transverse colon from the same cause (see figure 2).

majority of these patients were Negro women, about half of whom had syphilis and nearly all of whom had rectal stricture. None of these patients at the time of examination had suppuration of the inguinal glands. Opportunity has been afforded to see the earliest stages of the disease in the rectum in males who had practiced sodomy. The lower 8 cm. of mucosa is bright red and covered with small pinpoint ulcers. Later these ulcers coalesce, and there develops in the submucosa typical shotlike discrete indurations that give to the examining finger the sensation of numerous small elevations. The

amount of ulceration in the rectal mucosa varies in degree; in some cases the ulceration is slight and the submucosal induration very marked. Several patients have been under observation from the inception of the disease until marked rectal stricture, accompanied, as is usual, with perirectal abscesses or rectovaginal fistulas, was present. A short history of one such case will be given:

CASE 1.—Mrs. A., aged 25, white, who had just been delivered of her first baby, was referred to us because of rectal bleeding and tenesmus, which had been present for one month. She was in general good health. Examination showed superficial ulcerations and marked hyperemia of the rectal mucosa, involving 8 cm. of the terminal bowel. There was beginning induration in the submucosa of the bowel in this area, which gave a pebbled feel to the examining finger. Pus from the ulcerations contained no gram-negative diplococci; cultures of the pus revealed no unusual bacterial flora; the blood Wassermann reaction was negative. The inguinal glands were not enlarged, nor had the patient noticed soreness in the groin. Pelvic examination was negative. There were no urinary symptoms. Since we recognized the lesion as one which led to rectal stricture, and believing as we did that it was venereal in nature but of unknown cause, we advised a course of antisyphilitic treatment and gave the patient instructions in the use of weak silver nitrate enemas. Neither of these procedures made the slightest change in the progressive character of the disease, and as years went by the rectum became more narrow and the induration in the rectal wall more pronounced, and at the same time the general health of the patient began to fail in that she became anemic, lost considerable weight and had increasing difficulty with bowel movements, pus discharge and finally the development of perirectal abscesses. In 1932 we obtained some antigen from DeWolf and Van Cleve and made a Frei test, which was strongly positive. Dr. Loring then gave her a series of intravenous injections of antimony with some general improvement. By this time, however, the whole rectum, as palpated through the vagina, was felt as a hard indurated tube up to the posterior fornix. Rectal examination revealed a tight stricture about 5 cm. inside the anus. A colostomy was advised and refused. Later in June 1935 the patient came into the hospital

rectum was practically nil and the patient's outlook on life had materially improved. The rectum still was markedly strictured but the induration in the wall of the bowel was less.

This patient's history illustrates many of the impressions that we have gained in the observation of a large number of these rectal lesions: that suppuration of the lymph glands is the exception rather than the rule in rectal stricture from lymphogranuloma inguinale; that antisyphilitic treatment is usually without avail and

Fig. 3 (case 3).—Biopsy from ulcer of transverse colon due to lymphogranuloma inguinale in a patient who was having rectal stricture.

Fig. 2 (case 3).—Filling defect (A) in transverse colon due to ulcer from lymphogranuloma inguinale.

with a temperature of 103 F., a leukocytosis of 28,000, emaciation, an extensive perirectal abscess and rectovaginal fistulas, and suffering from anemia and emaciation. At this time a left-sided colostomy was performed. There was no involvement of the lymph glands at the promontory of the sacrum, no fluid in the abdomen, and the sigmoid, as is usual, was normal. Following the performance of the colostomy the patient's condition began to improve and six weeks later, August 1935, she had gained 20 pounds (9 Kg.); the perirectal suppuration had almost subsided, discharge of pus from the

rectal stricture eventually develops; that in the early stages of the rectal lesion the presence of numerous isolated submucosal indurations are characteristic of the disease; that dilation of the stricture is useless and even harmful; that colostomy results, in most instances, in almost immediate amelioration of the symptoms, although the rectal lesion never becomes entirely inactive, and in those few instances in which the colostomy has been closed the disease has again become active, and, lastly, that since the introduction of the Frei test many doubtful lesions of the rectum have been found to be lymphogranuloma inguinale.

Since our use of the Frei test in 1932 we have examined twenty-seven cases of typical venereal stricture of the rectum, four white females, nine white males, ten Negro females and four Negro males. The duration of symptoms ranged from three weeks to ten years. The Frei test was positive in all the cases. The treatment of this type of inflammatory stricture of the rectum has been unsatisfactory. Dilation does not give permanent relief of symptoms. Various treatments such as carbon dioxide snow, aqueous solution of iodine, arsphenamine, gold salts, 4 per cent copper ammonium sulfate, vaccines and tuberculin have been used without results. In many cases relief of symptoms is obtained only by a colostomy. During the last three years we have used antimony and potassium tartrate or fuadin in the treatment of fourteen cases. In thirteen of the cases treated there was an improvement in the general condition and a decrease in the amount of blood and pus from the rectum. Eleven of the cases were of long standing and there was no change in the stricture. Three cases of a duration of one year or less showed

a definite decrease of the infiltration of the rectal wall. The case of three weeks' duration is symptom free now after ten months of treatment. A recent examination showed only one small ulcer of the mucous membrane. From our observations of these cases there is no doubt that treatment has been of some value. Early diagnosis and treatment may prevent stricture formation.

The experimental work of Hellerström, Levaditi and others has put lymphogranuloma inguinale in the class of constitutional disease and therefore an increasing interest will be manifested in lesions apart from the genitals and rectum, which are a part of the disease picture. The first patient illustrating more extensive extragenital lesions than are usually seen had not only involvement of the rectum with stricture formation but also involvement of the sigmoid, and in the course of the disease several epileptiform seizures developed which have been greatly alleviated by the intravenous injection of antimony. A short history of the case will be given:

CASE 2.—Mrs. H. N., aged 32, admitted to Cook County Hospital, Nov. 30, 1925, had been operated on for hemorrhoids and rectal fistula six years before. Since then she had been troubled with perirectal abscesses, stricture of the rectum and incontinence. Examination showed a tight stricture of the rectum about 5 cm. from the anus, marked induration of the rectal wall as far as it could be palpated through the vagina, numerous rectovaginal fistulas and perirectal fistulas. The Wassermann reaction was negative; there was no history of gonorrhea. December 21, in an attempt to make a left inguinal colostomy, the sigmoid and descending colon were found to be indurated and hyperemic, with a marked foreshortening of the mesentery of the sigmoid. The process in the rectum seemed to have continued upward, involving the colon. A cecostomy was done. The patient was lost sight of until Aug. 1, 1927, at which time she was admitted with abdominal pain, distention and diarrhea, and it was decided to do an ileostomy to side-track completely the fecal stream from the lower portion of the colon and rectum. Sept. 27, 1932, she returned, saying that since 1928 she had been having spells of unconsciousness. The first one came on suddenly and without warning while she was working at the sewing machine. She was taken to the hospital, where she remained in a comatose state for four days. The diagnosis at this time was idiopathic epilepsy, and she was treated with phenobarbital. In 1932 the attacks of unconsciousness increased in frequency until, in February 1933,

Fig. 4.—Lymphogranuloma inguinale affecting tongue. (Courtesy of Dr. David Bloom)

she was having from four to six attacks a week, each one lasting about two hours. At this time the Frei test was made and was strongly positive. In February 1933 she weighed but 85 pounds (38.6 Kg.). She was then given antimony and potassium tartrate intravenously, the dosage being 10 cc. of 1 per cent solution twice a week. Later fuadin, 5 cc. twice a week, was given intramuscularly. Since then she has been continuously treated and has gradually improved. She now weighs 123 pounds (55.8 Kg.). From the very start of the treatment with antimony there was a decrease in the frequency and intensity of her attacks of unconsciousness. She has gone

five weeks without an attack. She now can tell when they are coming. The duration of the attacks is now from one to ten minutes. The only complaint about the intestinal tract is the presence of the ileostomy and the cecostomy, the latter not being able to be closed because of the tight stricture of the rectum. When the cecostomy was closed, toxic symptoms similar to those occurring in a closed loop of bowel appeared.

It is, of course, obvious that the epileptiform attacks in this patient may not be due to encephalitis caused by lymphogranuloma inguinale, although the possibility is

Fig. 5 (case 4).—Ulcer at base of tongue with suppurating submaxillary and supraclavicular glands. Biopsy of this ulcer is shown in figure 6.

interesting and suggests the use of the Frei test in other cases of epilepsy. The extension of the rectal inflammation into the colon seems highly probable, especially in view of the next case to be reported, which instances the formation of a large granulomatous ulcer in the transverse colon and the repeated spontaneous closure of colostomies due to extension of the lymphogranulomatous disease into the colon:

CASE 3.—Mrs. Maud J., white, aged 31, entered the Presbyterian Hospital July 5, 1925, with a history of perirectal abscess ten years before, which had been operated on several times and finally opened into the rectum. In February 1925 diarrhea developed with from six to twelve stools a day, accompanied by chills and fever. She had lost 25 pounds (11.3 Kg.) and was short of breath and anemic. Rectal examination revealed a tight rectal stricture 5 cm. from below, with induration of the bowel wall felt through the vagina as high as the posterior fornix. There were also numerous submucosal infiltrations palpable by rectal examination. Fluoroscopy showed the process limited to the rectum. The blood Wassermann reaction was negative. In November 1925, diarrhea and weight loss continuing and all treatment failing, a left inguinal colostomy was done. No pathologic condition was present in the sigmoid or adjacent colon. Following this operation she gained 20 pounds (9 Kg.) and the diarrhea ceased. In July 1927 she had gained 40 pounds (18 Kg.). The rectum at that time was still strictured and showed superficial ulceration of the mucosa. Biopsy of the rectal tissue showed round cell infiltration of the submucosa (fig. 1). There were no giant cells or tubercle formation. In January 1930 she returned, complaining of abdominal cramps and the passage of old blood from the colostomy. An x-ray examination showed a filling defect in the transverse colon which was diagnosed carcinoma (fig. 2). January 29, laparotomy revealed a large flat ulcer on the mesenteric border of the first part of the transverse colon. The ulcer was 2 inches (5 cm.) long and nearly encircled the bowel. There were small soft glands in the mesentery which did not feel carcinomatous. The lesion in the bowel did not look like a carcinoma. The liver was negative, as was a general abdominal exploration. The portion of the transverse colon containing the ulcer was removed by an obstruction resection operation, leaving a double barreled colostomy in the transverse colon.

The histologic study of the flat ulcer, which had involved the muscularis of the bowel, showed round cell infiltration without giant cells or tubercle formation similar to the histologic picture found in the rectum (fig. 3). The histologic diagnosis

was granulomatous ulcer of the colon. Cultures of pieces of the ulcer revealed no unusual organisms, *Bacillus coli* predominating. The transverse colon colostomy was closed. In January 1931 the patient returned, complaining that the inguinal colostomy was closing. Examination showed it to be inflamed and covered with granulation tissue, leaving but a very small opening into the bowel. Under procaine hydrochloride anesthesia the bowel was mobilized and divided so that the opening in the sigmoid was about 3 inches (7.6 cm.) long. The edges of the mucosa were sewed to the skin. August 4, passage of old blood

Fig. 6 (case 4)—Biopsy from base of tongue at site of an ulcer due to lymphogranuloma inguinale.

and pus from the colostomy, weakness, nausea and vomiting, abdominal cramps and loss of weight were reported.

An x-ray examination revealed a filling defect in the descending colon below the splenic flexure, which had the same appearance of the defect in the transverse colon that had been previously excised. At this time a colostomy was made in the middle portion of the transverse colon so that the lesion in the splenic flexure could be side-tracked from the fecal stream and be treated by various types of irrigations, all of which had no beneficial effect. In June 1932 the sigmoid colostomy had entirely closed and, because of large amounts of pus and blood draining retrograde through the transverse colon colostomy, an attempt was made to reestablish the sigmoid colostomy, which failed because of obstruction of this portion of the sigmoid. About this time a Frei test was made and found strongly positive, and intravenous injections of antimony and potassium tartrate were started. In spite of the treatment, the colostomy of the transverse colon became superficially infected and began to contract so that the opening in it decreased to the size of the tip of the index finger. This was enlarged surgically on several occasions. The injections of antimony and potassium tartrate were kept up with intermissions for the next two years, with considerable general improvement of the patient's health but discharge of pus from the colostomy, and more or less diarrhea continued. Biopsy of the material around the colostomy revealed the same picture as that seen in the flat ulcer of the colon and in the tissue from the rectum. In December 1934 the patient moved to Bethlehem, Pa., where she was advised to see Dr. W. L. Estes, who wrote that she had lost 20 pounds. Subsequently she died.

In all probability this patient suffered from an involvement of the rectum and colon with lymphogranuloma inguinale of a particularly virulent sort. No biopsy of the material ever revealed manifestations compatible with tuberculosis, whereas throughout the disease the Frei test was strongly positive and the Wassermann reaction was negative. Treatment was

of little or no avail. The course of this disease suggests the use of the Frei test in other obscure granulomatous lesions of the colon.

Prior to the establishment of lymphogranuloma inguinale as a definite venereal disease, several instances had been reported in which injury to the surgeon's finger during operation on inguinal bubo had resulted in axillary adenitis and, in one surgeon, a positive Frei test twenty-three years later. Hilding Bergstrand<sup>8</sup> in 1928 suggested that lymphogranuloma inguinale might manifest itself as a generalized disease with efflorescences in the throat and reported the case of a man, aged 46, with dysphagia, and a red soft palate and pharynx covered with small granules that were red but not ulcerated. Six months later, inguinal and axillary adenopathy were present. A biopsy of the lesions of the throat were variously diagnosed as syphilis and tuberculosis. The Wassermann reaction was negative and the Frei test was positive. In 1931 Buschke and Curth<sup>9</sup> reported a case in which erosions on the tip of the tongue and cervical adenitis developed after improper relations with a prostitute. The Frei test and the blood Wassermann reaction were positive. Anti-syphilitic treatment had no effect on the lesion on the tongue.

David Bloom<sup>10</sup> reported the case of a man, aged 45, who after improper relations with a prostitute developed a painful nodule on the tongue (fig. 5), which he cut open with a razor. The anterior third of his tongue became enlarged and indurated (fig. 4); the mucosa on the upper and under surface was granular.

There were many glands enlarged in the submental region. The temperature was 104 F. The Frei test was positive with five different antigens; the blood Wassermann reaction was negative. A biopsy on the tongue showed hyperplasia of the epithelium and edematous connective tissue with numerous lymphocytes beneath the epithelium. The pus obtained from broken down cervical glands was sterile and when an antigen was made from it gave positive Frei reactions on five patients known to have lymphogranuloma inguinale. Guinea-pig inoculation was negative. Bloom treated this patient with intravenous injections of from 5 to 7 cc. of 1 per cent

Fig. 7 (case 4)—Positive Frei test in case presenting ulcer of tongue from lymphogranuloma inguinale

antimony and potassium tartrate, giving altogether 130 cc. The lesion not receding rapidly, he gave the patient fifteen subcutaneous injections of his own antigen, starting with 2 cc. and increasing the dose to 2.5 cc.

Coutts,<sup>11</sup> working in the University of Santiago, Chile, believes that tongue lesions in sexual pervers are common. The tongue becomes swollen and infiltrated but is not especially painful. The cervical lymph glands become enlarged. Many of these patients show a positive Kahn test but show no improvement on anti-syphilitic treatment. He reports twelve such cases that gave a positive Frei test. The lesions persisted a long time, and one patient died.

Case 4, in which a large ulcer appeared on the floor of the mouth and base of the tongue, presents an unusual picture of lymphogranuloma inguinale and, in keeping with the extragenital lesions reported, strongly indicates that the ulcerating lesions of the disease take their origin by contact infection and that the lymphatics are secondarily involved, as they are in any other infection. This is in keeping with our feeling that the rectal lesions of the disease are contact infections occurring in women with vaginal infection, which because of uncleanness directly contaminates the rectum, and occurring in perverted men practicing sodomy:

CASE 4.—E. E., a white man, aged 52, married, referred by Dr. V. M. Leech, entered the Presbyterian Hospital, Nov. 21, 1934, three weeks after a small ulcer had developed on the floor of the mouth near the attachment of the tongue. The only etiologic factor obtained was the possibility of a slight cut when the patient licked the glued flaps of some envelopes. There was very slight discomfort from the lesion, which gradually increased in size and discharged a thick purulent material. His physician treated the ulcer with a caustic, but a week before admittance the submaxillary, submental and supraclavicular glands became swollen, and chills and a temperature of 103 F. developed. He had a severe headache at the time of entrance into the hospital; the patient had lost 15 pounds (6.8 Kg.), was pale and had thick speech. General examination was negative; the genitalia and rectum were normal. Urinalysis was negative. Blood pressure was normal. On examination of the mouth a flat ulcer, 4 by 3 cm., with raised edges and a foul base (fig. 5), covered with thick purulent exudate and indurated to the touch, was present on the floor of the mouth and running upward for 1 cm. on the base of the tongue. The elevated edge of the ulcer consisted of numerous nodules. The lesion was only slightly tender to touch. Both submaxillary regions were markedly swollen and reddened and were fluctuant. Both supraclavicular regions contained large tender glands, which subsequently broke down. There were large discrete glands palpable along the posterior border of the sternomastoid muscles. The axillary glands and epitrochlear glands were very slightly enlarged. The blood Wassermann and Kahn reactions were negative. The diagnosis lay between syphilis, tuberculosis or a granuloma of unknown origin. Cultures were made from the surface of the ulcer and at operation, when the submaxillary glands and supraclavicular glands were drained, a biopsy was made from the indurated edge of the ulcer and guinea-pigs were inoculated with a piece of the tissue as well as with pus from the submaxillary abscesses. When killed, the pigs were normal. Aerobic and anaerobic cultures from the pus from the glands were uniformly sterile. Smears showed no organisms. Cultures from the ulcer showed gram-plus cocci which were *Streptococcus viridans*. Anaerobic cultures showed gram-positive cocci and gram-negative rods. No tubercle bacilli, spirochetes or fusiform bacilli were found.

The biopsy material from the ulcer showed chronic inflammatory tissue without tubercle formation or giant cells (fig. 6). Because of the unusual character of the lesion, a Frei test was made, which was strongly positive with five different antigens (fig. 7). An antigen prepared from the pus obtained from the neck gave a positive Frei test in five cases known to be lymphogranuloma inguinale. The patient was now given injec-

tions of antimony and potassium tartrate intravenously, 10 cc. of a 1 per cent solution being used. Subsequently 3 cc. of fuadin intramuscularly have been given for two weeks with a two weeks free interval to the present time. The ulcer on the base of the tongue slowly healed until August 1935, at which time it was entirely healed, although the floor of the mouth was still indurated. There was an occasional exacerbation of infection in the glands of the neck, although by August 1935 there were but a few small palpable glands along the sternomastoid muscles. The general health of the patient has returned to normal.

#### SUMMARY

1. The importance of contact infection in lymphogranuloma inguinale has not been sufficiently emphasized.
  2. Rectal strictures from lymphogranuloma inguinale develop without inguinal gland suppuration in most instances. It is suggested that contact infection from vaginal secretions in the female and by perverted habits in the male is the usual manner of infection.
  3. Lymphogranuloma inguinale may cause serious ulcerating lesions in the colon or in the mouth, and it is suggested that the Frei test be more frequently used in granulomatous lesions of unknown origin. The relation of lymphogranuloma inguinale to meningo-encephalitis of unknown origin should also be suspected.
  4. Colostomy offers the best method of treatment of marked rectal stricture from lymphogranuloma inguinale; inactivity but never cure of the lesion results.
  5. Treatment of lymphogranuloma inguinale has not been satisfactorily developed, but the use of 1 per cent antimony and potassium tartrate or fuadin intramuscularly offers some prospect of amelioration of the disease.

## EPITHELIOMA OF THE SKIN OF THE BRIDGE OF THE NOSE

### REPORT OF A CASE

MILTON FRIEDMAN, M.D.

AND

JEROME ENGEL, M.D.

NEW YORK

Epithelioma of the skin, when small, can be readily treated by many different methods and technics. When it is extensive, a specially designed means of handling the lesion is required.

In the case herewith reported there was an extensive basal cell epithelioma of the skin originating at the inner canthus of the eye and bridge of the nose. Because of the size and extent of the lesion, it was deemed advisable to treat the lesion with massive doses of low voltage roentgen rays.

### REPORT OF CASE

W. C., a white man, aged 49, admitted to the eye service at Bellevue Hospital, Aug. 19, 1935, complained of a large, tender, painful, foul-smelling mass over the left eye. Because of the evident malignant condition, the patient was transferred on the following day to the radiation therapy service. The past history was irrelevant, except that the patient's mother died of carcinoma of the stomach, and two aunts had a cancer of the nose, similar to his lesion.

Three years before admittance, while the patient was in Central America, the lesion began as a minute, wartlike growth on the left side of the nose. It was not tender or painful. Several times the patient pulled out the growth, but each removal was followed by a recurrence. After one year the site of the lesion became red and inflamed. A physician diagnosed the growth as a skin cancer but administered no treat-

11. Coutts, W. E.: *Dermat. Wechschr.* 97: 1664 (Nov. 25) 1933.

From the Radiation Therapy Department, Bellevue Hospital, Dr. Ira I. Kaplan, director.

ment. The lesion continued to increase in size, and in February 1935 the patient entered a hospital, where a cherry-sized lesion was removed with surgical endothermy. Healing was complete in two months, leaving almost no scar.

In June 1935 a red pimple again appeared at the original site and grew so rapidly that it reached the size of an egg in about

Fig. 1.—Lateral view of lesion before treatment.

two weeks. Roentgenographic examination at this time revealed involvement of the nasal bone. No treatment was given, but the patient was advised to seek treatment at a cancer institute.

Fig. 2.—Anterior view of lesion before treatment.

The patient then returned to the United States and entered Bellevue Hospital August 19. In the interim the lesion grew, became necrotic and infected, and bled almost continuously. The patient had lost 47 pounds (21.3 Kg.) in seven months and entered the hospital in a moribund, cachectic condition.

When first examined, he was found to be semicomatose, stuporous, pallid and cachectic. Little history was obtainable at

this time. Protruding apparently from the left orbit was a large, spongy, friable, extremely tender growth, covered with a foul-smelling, necrotic, bleeding membrane. It extended from the outer canthus of the left eye over the bridge of the nose to a position overlapping the inner canthus of the right eye. It extended vertically from the left eyebrow to the level of the nasolabial junction. The tumor measured 7 cm. in diameter and protruded 5 cm. from the surface of the face. The left eye was completely obscured by the tumor and could not be examined (figs. 1 and 2). The cornea of the right eye was clear, but the conjunctiva was inflamed and covered with a mucopurulent exudate. The photophobia was so intense in this eye that no light impulses could be tolerated. The slightly edematous lids were held continuously shut. Thus the patient was practically blind. It could not be ascertained whether the growth had originated from the orbital cavity or from superficial tissues. There were no palpable cervical nodes.

The Wassermann reaction was negative. The blood count was 3,100,000 red blood cells, 27,000 white blood cells, 87 per cent being polymorphonuclears and 13 per cent lymphocytes. The hemoglobin was 60 per cent. Urinalysis revealed nothing abnormal. The temperature ranged from 98.6 to 101 F.

Fig. 3.—Section of lesion under low power demonstrating the papillary character of the cell group configurations and the resemblance of these papillae to the stratified squamous epithelium.

Biopsy was done and examination of the specimen revealed an epidermoid carcinoma, with a plexiform and papillary arrangement of the cells. The cell type was difficult to classify, but in some areas prickle cells connected by intercellular bridges could be recognized. The histologic diagnosis was papillary squamous cell carcinoma (figs. 3 and 4).

A roentgenogram disclosed almost complete destruction of both nasal bones, due partly to pressure erosion and partly to infiltration. There could be seen only a faint, irregular, residual outline of the bone.

Because of the marked illness of the patient, roentgen therapy was advised. The first treatment, given August 22, consisted of 4,000 roentgens (measured in air), which was equivalent to ten skin erythema doses. The factors employed were 100 kilovolts, 4 milliamperes, no filter, target-skin distance 30 cm., thirty-three minutes' exposure time and a circular portal 7 cm. in diameter. The surrounding tissues were carefully screened off with sheet lead cut to the exact contour of the lesion. This roentgen treatment was given in an attempt to shrink the lesion and reduce the secondary infection, with the idea that surgery might be carried out later.

One week after the first treatment, August 22, an attempt was made to remove as much of the tumor as possible with the endothermy knife. The patient's poor general condition did not warrant a general anesthetic. No local anesthesia could be employed, because the tissues around the base of the

lesion were inflamed and tender. Furthermore, we were not sure at the time that the growth did not originate from the orbital cavity, under which circumstances a local anesthetic would be even less effective. There was so much liquefaction necrosis of the tumor that the endothermy cutting knife could not function properly. The bleeding was profuse. Peculiarly enough, this procedure caused such pain even in the superficial necrotic portions of the tumor mass that only about 20 per cent of the mass could be removed, and most of this was plucked off with forceps.

The first day after the operation the patient rapidly grew more stuporous, becoming incoherent and irrational, and had to be restrained. This condition lasted for several days and then gradually cleared up under supportive treatment, consisting of intravenous and subcutaneous injections of saline and dextrose solutions and stimulants.

One week after the operation, September 3, the second treatment of 4,000 roentgens was given. At this time there was very slight further shrinkage of the mass. A third dose of 4,000 roentgens was given one week later, September 10. Following this the mass began to shrink very rapidly, until October 3, three weeks later, it had reached 20 per cent of its original size and a fourth treatment of 4,000 roentgens was given. Only as the shrinkage progressed were we able to ascertain definitely that the mass had not arisen from the orbital cavity but from the skin around the inner canthus of the eye and the side of the nose. The tumor had merely rested on the eye, compressing and pushing the lids apart.

During this period the patient's general condition rapidly improved and vision was slowly returning to the right eye, although he was still suffering from a marked photophobia. October 14 the fifth treatment of 4,000 roentgens was given. The patient could now distinguish objects with his right eye. The left eye was almost completely uncovered but he could not open the lids, owing to the long period of inactivity. All that remained of the lesion was a crater, 3 cm. in diameter, with rolled raised edges composed of neoplastic tissue, in the center of which was a pedunculated mass, measuring 1 by 1.5 by 2 cm. At this time, the patient's blood count was almost normal.

The left eye was now found to be completely degenerated as a result of pressure necrosis produced by the tumor. We

November 12 the sixth and final treatment of 4,000 roentgens was given. At this time it was seen that the tissues in the center of the small residual crater had infiltrated and destroyed the nasal bone. In spite of the danger of radiation osteitis and osteomyelitis, since there was only 2 mm. of tissue covering the eroded bone the final treatment was given through a portal which now measured 2 cm. in diameter.

Fig. 5.—Appearance of healed lesion, twenty-one weeks after onset of treatment. The left eye, which has twitched, is a glass eye. The residual anatomic defect consists of a slight depression of the bridge of the nose.

Fig. 4.—Section of lesion under high power showing the marked resemblance to the stratification seen in the normal skin, including a basal layer and a prickle cell layer with intercellular bridges (B).

do not believe that the treatments contributed to the destruction of the eyeball, because we were well able to protect it with lead from the influence of the rays and because other adjacent tissues which were exposed to potentially larger doses of x-rays were relatively unscathed.

By December 10 the lesion had healed completely, leaving only a small depression on the lateral left side of the bridge of the nose measuring 0.5 by 1.2 cm. It was completely epithelialized. December 11 the left eye was eviscerated and one month later was replaced by a glass eye. Roentgenograms of the nasal bones, taken Jan. 13, 1936, showed partial irregular calcification with reformation of the nasal bones almost to their normal configuration. On February 15 the patient won first prize in a rifle shooting contest.

#### COMMENT

Widmann<sup>1</sup> and Grier<sup>2</sup> have developed and popularized the use of this type of radiation in shaving down successive layers of bulky tumors by employing escharotic doses of nonpenetrating roentgen rays. There is considerable latitude in the technic recommended. The voltage may range from 100 to 120 kilovolts, but the rays must be unfiltered. The distance and intensity are of no great consequence. The prime requisite is that the rays be nonpenetrating. The ideal unit dose and the time intensity factors are still to be delineated. Grier's maximum dose was 8,000 roentgens (measured with back scattering) delivered in four or more treatments over a period of one week. This dose, which is much less than our total dose of 24,000 roentgens (measured in air), is probably meant for smaller lesions.

Our principles more closely follow Widmann's suggestions, which entail the administration of single

1. Widmann, B. P.: Further Observations on the Use of Unfiltered Roentgen Rays for Superficial Cancers of Wide and Deep Involvement. *Am. J. Roentgenol.* 34: 644-652 (Nov.) 1935.  
2. Grier, G. W.: Radiation Therapy of Cancer of the Skin. *Am. J. Roentgenol.* 32: 206-210 (Aug.) 1934.

weekly doses of 2,500 roentgens (measured in air) or 1,500 roentgens, depending on whether the lesion is a bulky, spherical mass or a relatively flat indurated ulceration, except that our unit dose is larger. The interval of one week or more between treatments allows sufficient time for response to the irradiation. Thus the subsequent treatment may be planned for a smaller lesion, permitting more careful protection of the surrounding normal tissues, from which the growth has receded. After the first three treatments have been delivered in the first two weeks, it seems wise to wait for two or three weeks before resuming further therapy in order to get the full cumulative effect of the early treatments.

A feature of this technic is that there is little tendency for the remaining tumor cells to become radiation fast, such as occurs when a more penetrating ray is employed, which produces a partial desmoplasia in the deeper cells, giving them more radioresistant characteristics.

Our treatments were given in units of ten skin erythema doses, or 4,000 roentgens (measured in air). This does not accurately express the dose delivered because, with the progressive shrinkage in the size of the portal used, the slight decrease in backscattering depreciates the amount of radiation that reaches the tissues.

This technic is ideally suited for noninfiltrating lesions such as basal cell epitheliomas. However, the successful treatment of certain types of infiltrating squamous cell epitheliomas, which have a tendency to rapid extension, is complicated by the exclusive use of this procedure. We have had several instances wherein the local lesion has been completely destroyed and the defect healed over following the use of low voltage roentgen rays, only to be followed in a short time by the appearance of a halo of multiple, papular, subcutaneous nodules around the lesion, as the result of growth of peripheral subcutaneous extensions of the primary tumor, which could not be felt and could not be attacked by the rays because they were lying underneath the normal skin, which would have sustained an irreparable x-ray burn if exposed to these large doses. Therefore, in the presence of an actively growing carcinoma with a tendency toward rapid infiltration and metastasis, the low-voltage technic may be employed for several treatments in order to remove, in the most conservative fashion possible, the bulk of the mass. It should soon be replaced by the use of the more penetrating higher voltage roentgen rays or radium, with a selective intent.

309 West One Hundred and Third Street.

**Fish: A Billion Dollar Industry.**—Nearly 3,000,000,000 pounds of fish make up our annual catch. If all these fish were landed at one port, it would require ten full-size freight trains moving every day in the year to haul them to the market. These fish bring a total income of over \$60,000,000 to 117,000 fishermen. When we include manufacturing and distribution connected with the fisheries, we find that we have a billion dollar industry. Fish occupies a unique place in the diet of the nation. The public has become vitamin conscious within the past decade. All the vitamins except E are present in varying amounts in the fish or shell-fish products. Iodine is another substance which is apt to be lacking in our diets, especially if we live in inland cities. Inclusion of fish in the diet supplies this necessary element, as well as the calcium and phosphorus which build healthy bones and teeth. Iron and copper . . . are present in oysters.—Bell, F. T.: *Fish and Their Management*, *Talks* 1:32 (April) 1936.

## DIAGNOSTIC DIFFICULTIES IN BONE TUMORS

ROBERT D. SCHROCK, M.D.

OMAHA

The medical profession, in its constant search for added knowledge in the combat of human frailties, finds itself periodically riding waves of interest and enthusiasm on particular subjects of study. In a review of publications over any period of years there is discovered a preponderance of literature on the popular subject of that day.

In orthopedic surgery there is found, over distinctive periods of years, a flux of literature indicative of the then major interests in scoliosis, muscle tendon transplantations, foot stabilizations, low back derangements

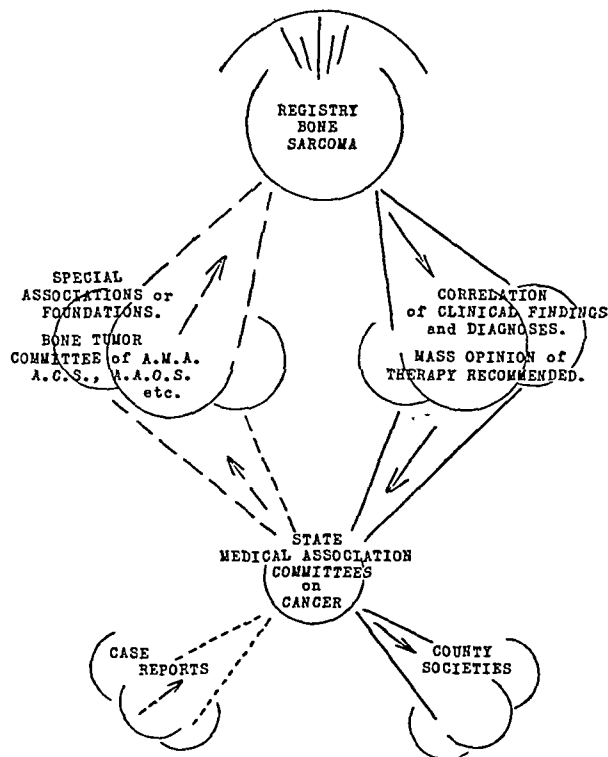

Fig. 1.—Plan for correlation of national agencies through membership of local societies for collection and dissemination of data on bone sarcoma.

with their fusions, arthrodesis for tuberculous joints, and open reduction of congenital misplacement of hips. Resulting from these periods of intensive interest, opinions have been well crystallized and subsequent methods of therapy well established as promising most for the ultimate welfare of the patient.

At the present time the popular problems are fractures and bone tumors. The former is intriguing because of the increase in serious injuries. The education of the public to feel that dysfunction and deformity need not always result is demanding increased efficiency of the doctor in charge. The standard of good fracture management is gradually being raised to a better level. This has resulted from extensive study by special groups, their selection of the best methods and wide dissemination of this information to both the profession and the public.

Owing to lack of space, this article is abbreviated in *THE JOURNAL* by the omission of several illustrated case reports and a bibliography. The complete article appears in the author's reprints.

The perplexing problem of bone tumors is now being attacked on a wide front. The early scouting and plan of campaign in this country have been well laid by Drs. Ernest A. Codman, Joseph C. Bloodgood, James Ewing and William B. Coley. In recognition of their coordinated efforts the American College of Surgeons established in 1921 the Registry of Bone Sarcoma. This institution is characteristically American. Its purpose is centralization of data and material, diffusion of education and information, and assistance to the profession at large for the solution of individual bone tumor problems. The efforts of these men have stimulated many associates to the collection of material and painstaking analyses, adding much to present-day knowledge. The cause of malignancy in bone is still unknown. The theories applicable to cancer are identical in their application to new growths of mesenchymal tissues. Clinical study of the development of individual bone growths has not been in general as detailed as has been the study of the cellular development. There is yet to be obtained valuable information from the observation of new bone growths from the time of their earliest discovery through their life history to its termination in individual cases. For this, extensive collection of histories of carefully followed cases is a necessity.

Fig. 2 (case 1).—Antecedent infectious pathologic changes in contiguous bone. Osteomyelitis of the tibia, duration five and one-half years. Ewing's tumor of the fibula; duration one and one-third years. Multiple metastatic lesions. Death.

There are numerous committees for the study of cancer. Each national medical or surgical association has provided itself with a committee for this purpose. Special research funds are allocated for this purpose by various foundations. There are now developing in various state medical associations cancer committees subdivided for special lines. California has probably led the way. The state committee membership is drawn largely from the group of men serving in similar committees of other organizations. Duplication of effort is the rule.

Effectiveness of effort and better coordination of results seem feasible by correlation of these national agencies through the membership and organization of the state societies with their component county medical units. Their purpose is acquisition of data of dependable quality and to furnish aid to the uninformed. Eleven organizations are working toward this end. May I then suggest in the study of bone tumors that the various committees give thought to the state associations as the elementary unit through which data may be collected and information disseminated. The national society committeemen naturally become liaison members of their state committee. These data through the subcommittee on bone tumors can then be made available to the committees of the various specialized societies for analysis and evaluation. The ultimate deductions

and authoritative opinions naturally would be anticipated from the committee of the Registry of Bone Sarcoma.

Orthopedic surgeons are by their conservation and reconstruction work drawn closely into the problem of bone tumors. Anticipation of future function is a factor of major moment. The functional demand on the affected individual and the site of the lesion will

Fig. 3 (case 1).—Antecedent infectious pathologic changes in contiguous bone.

be determining elements in the choice of therapy. The character of the lesion demands careful determination. Life is more essential than a limb; conservation of both may be possible.

Decisions as to the management of a particular problem are more frequently rational when viewed from various angles. Accuracy in diagnosis and effectiveness in therapy are directly in proportion to the carefulness, experience and judgment of the combined consulting group, clinician, radiologist and pathologist. On a debatable diagnosis the clinical features are not to be outweighed by the microscopic interpretation. The clinical and radiologic judgment of gross pathology in vivo must be tied into the interpretation of the microscopic management. It is not possible for the pathologist to pass judgment in all cases. In a review of some of the atypical and unclassified cases of the registry it is interesting to note the lack of authoritative assertiveness in the opinion of pathologists most

Fig. 4 (case 1).—Antecedent infectious pathologic changes in contiguous bone.

experienced. Says Dr. Ewing (Biopsy in Bone Sarcoma): "The biopsy should be the last step in the diagnosis of bone sarcoma" and implies properly the attempt of hurried or uninformed clinicians to cover their deficiencies by resort to early biopsy and so to place the major responsibility on the pathologist.

The recognition and treatment of the benign bone lesion offers few difficulties to the surgeon of average discernment and skill. The malignant bone lesion with

its predictable outcome demands from the patient and the physician prolonged courage and fortitude. The intermediate or suspicious bone lesion demands a keen judgment, close study of all available facts in this and similar lesions, capacity to act without haste and ability to consult intelligently with men of greater and even less experience.

#### RULES OF PROCEDURE FOR BONE LESIONS

By JOSEPH COLT BLOODGOOD, M.D.

(Rearranged with permission and apology.)

1. Complete
  - (a) History, personal and family
  - (b) Physical examination, local and general
  - (c) X-ray and clinical laboratory examinations
2. X-ray Study
  - (a) Of all traumatized bone
  - (b) Of single lesion, repeated and comparative in various planes
  - (c) Of corresponding normal segment
  - (d) Of other bones for multiple lesions
  - (e) Of chest and pelvis for early metastasis; also lateral of skull, teeth
  - (f) Therapy early, if necessary as a time killer; if suspicion of malignant condition (200 kv. machine)
  - (g) Therapy discontinued if beneficial results are not evident in two to three weeks
3. Clinical Laboratory Study
  - (a) Temperature at regular intervals over adequate period
  - (b) Urine, especially for Bence-Jones bodies and excess calcium content
  - (c) Blood counts
  - (d) Blood Wassermann reaction
  - (e) Blood chemistry to include sugar, serum calcium and phosphorus and phosphatase
  - (f) Metabolism studies
4. Bone Tumor Biopsy
  - (a) Rarely, if ever, an emergency
  - (b) Not permissible where facilities for preparation of material are not available
  - (c) Desirable to have pathologist and radiologist in attendance
  - (d) Technic; aspiration (Martin and Ellis) (Stewart); excision of adequate material
  - (e) In dubious cases, opinions from consultants of wide experience (Registry of Bone Sarcoma)
5. Attitude of Physician Toward Patient
  - (a) Artistic approach in methods of obtaining opportunity for adequate study
  - (b) Avoid expression of opinions until definite plan of action can be determined
  - (c) Avoid mention of surgery or possible amputations until adequate mental preparation of the patient is accomplished
  - (d) Avoid activity of patient by rest in bed; or splints and sling for upper extremity and crutches for lower

(Reprint from "Bone Tumors," S. M. A.)

From the clinical standpoint there are bone tumors indubitably benign and others as certainly malignant. Between these groups is a great array of bone growths

whose present activity is not discernible and whose future conduct is hardly predictable. They are suspicious citizens of the community. They may remain as reformed incarcerated individuals or, on undue stimulation, demonstrate life or limb-taking characteristics. It is this borderline group from which the more valuable information is to be derived by prolonged and intensive study. Deductions cannot be properly drawn except from large groups of similar cases.

#### CONCLUSION

1. A plan of action for more adequate study of bone tumors has been offered. This plan is applicable to those states not possessing a generous scientific foundation and afflicted by agrarian legislators not sensitive to the beneficial effect of a generously supported state university.

2. Various angles of clinical and pathologic evaluation have been presented in the borderline group of bone tumors.

3. From a group of about 125 personally observed bone tumors, eleven case summaries have been selected. In these, prolonged observation has proved the diagnosis in some. In others, the diagnosis remains debatable.

#### SUMMARY OF CASES

The following cases exemplify certain difficulties in correlation of observations and deductions of opinion on therapy. Some of these difficulties are clarified by observations carried out over long periods.

CASE 1.—Antecedent infectious pathologic changes in contiguous bone.

K. G., a girl, aged 14 years, referred by Drs. Davis and Conlin, had suffered an attack of acute osteomyelitis in the tibia in 1924 which necessitated three operations. The disease became inactive. There was for four years a minor sinus with intermittent discharge and occasional extrusion of sequestrums. This was carefully followed in x-ray examinations. There were

Fig. 9.—Same case as in figure 7, May 1, 1934.

two minor contusions to the fibula in 1928, followed by slight increased activity of the disease process in the tibia and fibula—a process interpreted as similar to that in the tibia. The duration was for only a few days, the condition quieting after slight discharge from the old tibial sinus. Three months later there were increased signs in the fibula. Incision was made and drainage instituted, the tissue being reported inflammatory. She was first seen by us Nov. 9, 1928, and two months later

there was another flare up with signs of pleuritic irritation. Two weeks later (Jan. 24, 1929) there was clinical suspicion of new growth or infectious granuloma. February 18 this was clinically diagnosed as a type of sarcoma with pulmonary metastases, and yet the microscopic report showed "chronic inflammatory tissue." With radium therapy, marked and rapid improvement in the condition of both the leg and the chest was noted. The diagnosis then seemed established as Ewing's sarcoma. The patient's improvement permitted considerable activity for five months. In July 1929 the opinion of a consulting group in a major center would not confirm the diagnosis—they regarded the whole picture as infectious. In September there was a recurrence of symptoms with general metastases, both visceral and skeletal, which became radio-resistant. Death occurred Jan. 2, 1930, five and one-half years after the onset of osteomyelitis in the tibia and one and one-third years after the onset of Ewing's tumor in the fibula. The diagnosis was confirmed by the study of a section from a lymph gland post mortem.

CASE 2.—*Antecedent pathologic changes in involved bone.*

S. H., a woman, aged 60, referred by Dr. Synhorst, had a thyroidectomy performed in 1916. In 1929 she complained of low back pain with sciatica on the left. In August 1932 she noticed a mass in the left thigh, which was not especially painful. There was slight loss of weight, weight now being 137 pounds (62 Kg.). A limp developed. November 14 there was enlargement of the left thigh with fusiform swelling and no local heat, the enlargement being firm and tender. Roentgenograms showed extensive changes throughout the left femur, cystic areas of bone lysis with cortical destruction and enlargement of the shaft. The right femur showed cortical thickening and irregular density, patchy in character. There were moth-eaten areas in the pelvis. All clinical tests were negative. The blood calcium was a high normal (13 mg. per hundred cubic centimeters).

The working diagnosis was atypical Paget's disease with secondary new growth.

Nov. 18, 1932, there was generous exposure of the femur. Over the antero-external aspect there was a fusiform lobulated mass, which was firm. The bone was of variable density with cystic areas of destruction through the cortex and not very vascular. In the proximal third there was a mass of desiccated saponified material with calcareous or sandlike contents. After medullary decompression, muscle tissue was implanted into the medullary cavity. The wound was closed, a plaster spica was applied, and this was followed by protection with a walking caliper (J. & S.). The microscopic study showed hyperplasia of cartilage and bone with irregular arrangement, except where there was proliferation of loose fibrous connective tissue with strands of spindle cells scattered throughout. Our opinion was that this was an osteochondrosarcoma.

In March 1933 the patient was generally better, though she complained of some pain in the thigh. Increased changes were revealed on x-ray examinations.

Recurrence of the soft part of the tumor was noted May 14. Roentgen therapy was started (5,715 roentgens from May 5 to November 13) without appreciable benefit, unless it was to decrease the rate of growth. Disarticulation at the hip was recommended.

Dec. 12, 1933, a pathologic fracture occurred in the middle third of the femur. There was no evidence of metastases to the chest and the patient's general condition was very good. The middle third of the thigh increased to a circumference of 27 inches.

December 13, disarticulation at the hip joint was performed; convalescence was uneventful, and the patient went home in twenty-eight days.

In May 1935 she was in excellent condition with no evidence of local or general recurrence and was moving about actively on crutches.

CASE 3.—*Antecedent pathologic changes in soft parts; metastasis in bone secondary to adenocarcinoma of breast, quiescent six years.*

M. S., a woman, aged 47, had a radical breast resection in 1927 on account of a small tumor proved to be adenocarcinoma. The patient was in excellent health until September 1933, when there was a minor twisting injury to the right lower extremity, associated with a fall in which she struck the knee but did not

strike the right hip region. Following this, soreness was noted in the right hip and minor disability continued. She reported to us, Oct. 26, 1933, when tenderness was shown over the quadriceps extensor and fascia lata in its proximal third. Rest and protection by spica bandage gave no relief. Roentgenograms of November 15 showed cortical thickening in the shaft of the femur with decreased density in the greater trochanter and femoral neck. Pain and disability continued. Jan. 13, 1934, x-ray study showed a definite lesion, destructive in character, in the greater trochanter and subcervical region; also a suggestive lesion in the right ilium. A definite diagnosis was made of metastatic carcinoma, and roentgen therapy was instituted for symptomatic relief, but the lesion became radio-resistant after ninety days (3,465 roentgens from January 16 to May 11).

There was a pathologic fracture of the neck of the right femur, April 25, followed by intrathoracic metastases demonstrable August 13. Intracranial metastasis was noted, August 25, and death followed, Sept. 29, 1934. This case had been reported in a group of "five year cures" of cancer of the breast.

## PASSIVE VASCULAR EXERCISE

### OBSERVATIONS ON ITS VALUE IN THE TREATMENT OF PERIPHERAL VASCULAR DISEASES

HARWELL WILSON, M.D.

AND

NORMAN W. ROOME, M.D.

CHICAGO

Amputation may be the final outcome of serious peripheral vascular disease, but a large variety of conservative methods have been tried in an effort to prevent or delay radical surgery. A review of the literature shows that there has been considerable premature enthusiasm about many of the methods when introduced; some, however, have been proved of value and are retained to the present day.

Fever therapy, as by foreign protein injection, has been reported to give very good results; Barker<sup>1</sup> treated 150 cases of thrombo-angiitis obliterans by the injection of typhoid vaccine and noted marked improvement in 49 per cent of the cases, while slight improvement was said to have occurred in 27 per cent. Sodium chloride solutions given intravenously in large amounts have been used rather extensively; Samuels<sup>2</sup> feels that this treatment plus rest and cleanliness afford the best opportunities for the patient suffering from these vascular diseases. Allen<sup>3</sup> emphasized the beneficial effects to be had from using the foot exercises first described by Buerger. Vasodilator drugs have been used for a long time, and Denk<sup>4</sup> and Allen<sup>5</sup> have reported good results from the use of papaverine hydrochloride given intravenously for its vasodilator effects in cases of embolism of an extremity. This therapy is based on the theory that there is a reflex constriction of the collateral channels, but this lacks adequate proof. Of the foregoing methods of treatment, the two of definitely established value are rest and cleanliness.

Passive vascular exercise has recently been added to the armamentarium by Herrmann and Reid<sup>6</sup> and by

From the Department of Surgery of the University of Chicago.

5. Allen, E. V., and MacLean, A. R.: Proc. Staff Meet., Mayo Clin. 10:216-220 (April 3) 1935.

6. Herrmann, L. G., and Reid, M. R.: *Ann. Surg.* 100:750-760 (Oct.) 1934.

Landis and Gibbon.<sup>7</sup> These workers have reported that for a period of hours the skin temperature of an extremity can be elevated by treatment in the passive vascular exercise unit. Herrmann and Reid<sup>8</sup> in seventy-five unselected cases of "arteriosclerosis obliterans" reported the results given in table 1.

In another report<sup>9</sup> the same authors discuss the results of fifty-one cases presenting organic vascular disease and state that "forty-four patients (86.27 per cent) were greatly benefited by this form of therapy," while seven patients showed no relief of pain. Time had not been sufficient to state permanent results when this report was made.

TABLE 1.—Results in Seventy-Five Cases of "Arteriosclerosis Obliterans" with Passive Vascular Exercise Unit

10 cases showing "predominant involvement of major arterial pathways"	100% "complete relief"
46 cases showing "predominant involvement of secondary arterial pathways"	43% "completely relieved of major symptoms" 48% "greatly improved"
19 cases showing involvement mainly of "arterioles of the feet"	16% relieved 42% less pain 42% no change

In 1935 Landis and Hitgrot<sup>9</sup> reported their observations on thirty patients with arterial vascular disease treated by a similar method of suction and pressure. The patients treated were grouped into three classes as having (1) diabetes, (2) thrombo-angiitis obliterans or (3) arteriosclerosis. The results were quite favorable and a summary of the observations is given in table 2. They reported especially the relief of rest pain during the period of treatment but did not report observations as to the permanent effects on this type of pain. Lesions involving definite gangrene and large sloughs gave little or no evidence of change. "Intermittent claudication became milder and exercise tolerance was slightly but definitely increased."

Shipley and Yeager<sup>10</sup> reported almost uniformly good results in thirteen cases, but this small series included six different maladies.

De Takáts<sup>11</sup> in 1934 reported twenty cases treated with a positive and negative pressure machine in four of which incomplete treatment had been given, and the results in the remaining cases appeared unconvincing.

Allen and Brown<sup>12</sup> recently reported that in eleven cases the pain of "ischemic neuritis" was completely relieved by passive vascular exercise in two instances, was partially relieved in four cases and showed no permanent change in three, while two individuals became worse during the treatment. In twelve cases of thrombo-angiitis obliterans which exhibited "trophic changes" definite improvement was observed in four, while the remainder either showed no change or became worse during the course of the treatment. In seven cases with similar lesions produced by arteriosclerosis, improvement was noted in five instances. Many of these patients, although their cases were reported chiefly because of the passive vascular exercise treatment, also received other well recognized forms of therapy. All

were hospitalized, thus enforcing a large amount of rest. Surgical care was given the extremities when indicated, and in many cases fever therapy and intravenous sodium chloride were also used.

Thus it is apparent that even with a combination of all the best known methods the results obtained leave much to be desired. Also the difficulty of evaluating passive vascular exercise with the other methods is obviously very real until a much larger number of cases is studied and until longer periods of observation have been made. The present series of cases, while rather small in number, is reported to aid in further evaluating the results derived from this form of therapy.

REPORT OF CASES

*Selection of Cases and Examination of Patients.*—The patients treated were referred from various services in the hospital; however, when treatment was begun most of them were again examined, and their subsequent course was followed by one of us. We were chiefly interested in studying results obtained from passive vascular exercise treatment in arteriosclerosis, thrombo-angiitis obliterans and embolism.

In all cases an attempt was made to take a careful vascular history. The examination consisted of the routine physical examination and laboratory work (blood counts, urinalysis, Wassermann test) with especial attention to the vascular system and extremities. In a few instances vasomotor indexes were determined and in a few others skin temperature determinations were made, but in most cases only the usual clinical methods were used.

*Method of Treatment.*—The passive vascular exercise unit devised by Herrmann and Reid was employed. The negative pressures used varied from -60 to -80 mm. of mercury, while the positive pressure was +20 mm. of mercury. The machine was run at about 2 cycles per minute.

During the first few months a rubber cuff as described by Herrmann and Reid was used at the top of the boot. There was difficulty in fitting the rubber cuffs so that they would be air tight and yet would not obstruct the return of venous blood. Later special cuffs designed by Benson<sup>13</sup> were used. These were

TABLE 2.—Summary of Results

	Relief of Symptoms and Signs		
	None	Fair	Good
Diabetes.....	3	1	10
Thrombo-angiitis obliterans.....	2	3	7
Arteriosclerosis.....	1		3

available in various sizes to fit the individual extremity and consisted of a semirigid truncated cone, which was attached to the boot at its larger end and to the skin of the leg at its smaller end. An air-tight junction with the skin was obtained by suction applied to a circular groove on the inner surface of the cuff, petrolatum being used as a seal. No harmful effects to the skin have been observed from this method and we believe that it is a definite improvement over the cuff formerly used.

Most of the patients treated were hospitalized for at least a portion of the time. All patients receiving passive vascular exercise treatment were given careful instructions about care of the feet and abstinence from

tobacco, and were advised to carry out Buerger's foot exercises three times daily. A few of the patients also had other methods of treatment; one (patient 20) received a series of fever treatments and intravenous saline injections; another (patient 5) had a lumbar ganglionectomy before positive and negative pressure was instituted, and two others (patients 22 and 34, with embolism) were given papaverine hydrochloride. Improvement was evaluated approximately two months after completion of the treatment.

*Arteriosclerosis.*—Twelve cases diagnosed "arteriosclerotic obliterative disease" were given treatment in amounts varying from 17 to 111 hours (table 3).

plained of cramps in the dorsum of the right foot after walking and who had noticed a bluish discoloration of the right fourth and fifth toes for three weeks. The skin was moist and slightly macerated at the base of these toes. This patient improved rapidly, the color of the toes returned to normal, and the skin healed. The cramps in the foot almost entirely disappeared. Undoubtedly an important factor in the improvement of the foot was the better hygienic care that it received, since before treatment was begun this measure had been almost entirely neglected.

The remainder of this group showed no change whatever after receiving the treatment.

TABLE 3—Course of Vascular Disease in Twenty-Three Cases Treated with Passive Vascular Exercise Unit

Case	Age	Amount of Treatment		Symptoms and Signs Before Treatment	Comment on Condition After Treatment
		Total Hours	Days		
Arteriosclerosis					
1	74	48	49	I C* at 2 blocks; paresthesia, foot and calf, 2 yrs; no pulse in feet; feet cool and cyanotic	Can walk 3¼ blocks; able to work standing up; less "needles and pins"; no objective changes
2	66	69	46	I C* slight, rest pain in feet; weak pulse in feet; diabetic	No definite change noted
3	37	111	30	I C* at 1 block, dorsum of foot "feels frozen"; night rest pain; no pulse in feet	I C* at 2½ blocks, but improvement not permanent; night discomfort persisted
4	71	17	7	Pain and swelling in right foot for 6 wks; foot cyanotic, cool, swollen; no pulse in foot	No change; pain persisted even during treatment
5	61	77	38	I C* at 1 block; feet cool; no pulse in foot	Can walk 2½ blocks farther
6	68	82	20	Ulcer on left foot; rest pain present; foot cool, no pulse	Possibly less rest pain; no change in ulcer
7	70	108	27	I C* at 1-2 blocks, 2 yrs; night rest pain; feet cool, cyanotic, no pulse	Less rest pain; subjectively better; objectively little or no change
8	50	18½	10	Pain in right foot, 3 mos; discoloration of right 4th and 5th toes, pulse present in feet	Less pain; color of skin improved; skin ulceration healed
9	66	44	30	I C* at ½ block; paresthesia present; no pulse in feet; cyanosis of foot	Less paresthesia; can walk 6 blocks instead of ½
10	55	56	30	Rest pain in both feet; ulcer, left heel; I C* at 1 block	Ulcer improved as result of bed rest; no other change
11	62	42	10	Rest pain in right foot, 3 mos; discoloration of right 4th and 5th toes; no pulse in foot or in popliteal artery	No relief
12	72	20	10	Diabetic; 4th toes previously amputated; wound slow in healing	Condition unchanged; foot amputated later
Thrombo Angitis Obliterans					
13	44	42½	95	I C* at 2 blocks; paresthesia for 2 yrs; pulse present in feet	Can walk 6 blocks. Less paresthesia; improvement psychic?
14	53	46	90	I C* at 2 blocks; cold right foot; small ulcer on foot, no pulse	Less pain for 2 mos after which symptoms as before; amputation
15	44	45	39	I C* at 3 blocks or on standing 10 minutes; pulse present	No change
16	43	17½	20	I C* at 4 blocks; paresthesia present; left foot cold, but pulse present	No change
17	50	24	20	I C* at 1 block; rest pain in foot; gangrene of 2 toes, no pulse in foot	Less rest pain; can walk 3 blocks without pain; no change in gangrene
18	39	7½	14	I C* at ½ block; no dorsalis pedis pulse; poor post tibial pulse	No change
19	43	65	120	Painful gangrenous toe on right foot; I C* at 3 blocks; no pulse in foot	No change
20	53	114	80	I C* present; diabetic; paresthesia present; pulse present	Temporary improvement only
Embolism of Lower Extremity					
21	48	24	2	Rheumatic heart disease; sudden pain and pallor of right leg to 2 inches above knee	No change in extremity; died of cardiac failure 3 days later
22	51	42	8	Embolus right femoral 11 hrs before admission; pallor and no pulse below mid thigh	Recovered; received only 4 hrs of passive vascular exercise 1st and 2d days; papaverine hydrochloride also given but no definite changes noted after its administration
23	38	100	13	Embolus left foot, extended to popliteal; pallor, coldness and pain in foot	Intensively treated; gangrene; died 17 days after embolus

\* Intermittent claudication

Five patients apparently were slightly benefited, as they were able to walk farther without claudication and also complained of less numbness and tingling. These symptoms, however, did not disappear.

In patient 10 an ulcer on the heel of the left foot healed during the treatment. The bed rest was undoubtedly an important factor in causing the ulcer to heal, since it had previously been impossible to make the patient keep off the foot. The symptoms of intermittent claudication, rest pain in the feet, and the numbness and tingling were not influenced by the therapy, although a total of fifty-six hours was administered.

The only patient who showed a very definite objective change was a man of 50 (patient 8) who com-

*Thrombo-Angitis Obliterans.*—Eight cases were treated and in two there was improvement, as evidenced by the ability to walk from two to four blocks farther without claudication and by less numbness and tingling in the feet.

Six cases showed no change. In no case of this group was ulceration of the foot or gangrene of a toe benefited by the therapy.

*Embolism.*—In one case a femoral embolus occurred in a decompensated cardiac patient (21 in table 3). Twenty-four hours of treatment was given during the next two days without effecting any noticeable change in the extremity. Three days after the accident the patient died of cardiac failure.

Another patient (22 in table 3) was brought into the hospital eleven hours after an embolus lodged in the right femoral artery. Pallor, coldness and absence of pulse were noted to a point 2 inches (5 cm.) above the knee. This patient received about four hours of treatment at various intervals during the afternoon of admission and about the same amount the next day. The patient also received papaverine hydrochloride. Within twenty-four hours the color of the extremity had largely returned and the dorsalis pedis pulse could again be felt. It is difficult to believe that all the improvement was due to the passive vascular exercise treatment, since it was used for only four hours the day of admission and only four hours on the following day.

The third case (23 in table 3), a woman, aged 38, with rheumatic heart disease, was seen by one of us thirty-six hours after she received an embolus to the left foot. At this time the foot was slightly cooler than the right and the patient experienced a feeling of numbness. The color of the foot was fairly good, so that it was felt that the circulation was adequate. Heat was applied by means of an electric light cradle. Twelve hours later the toes and dorsum of the foot were definitely cyanotic and above this was an area of hyperemia. At this time also the popliteal pulse was found to be absent for the first time. Positive and negative pressure treatment was begun and continued intermittently for 100 hours over a thirteen-day period. Five successive doses of papaverine hydrochloride were also given (two doses intravenously). For several days it was impossible to tell whether the foot would survive or not. After nine days of treatment it was fairly certain that it would be necessary to amputate the foot. The patient died seventeen days after onset, supposedly from a cerebral embolus.

#### SUMMARY AND CONCLUSIONS

Twenty-three cases of peripheral vascular disease were treated by means of passive vascular exercise. Twelve cases were diagnosed arteriosclerosis; five of these were subjectively somewhat improved but there was little or no permanent change in the objective manifestations. One patient's complaints were relieved and the appearance of the foot definitely improved, although the fact that this patient was given only eighteen and one-half hours of treatment makes it doubtful whether the passive vascular exercise was responsible for the result. Six cases showed no change.

There were eight cases of thrombo-angiitis obliterans; of these two showed a slight decrease in the intermittent claudication and six showed no change.

Three patients with embolism were treated. Two died as a result of the heart disease that had given rise to the embolus. The third recovered but it is doubtful whether or not this was due to either the positive and negative pressure or to the papaverine treatments that were administered.

Many of these patients felt improved during the course of the treatment but reported no permanent beneficial results when questioned two or more months later. This is evidence of the lack of permanent benefit from the treatment and may indicate a considerable psychologic factor.

In this series of cases passive vascular exercise treatment did little good, and it was difficult to say whether the beneficial results that followed were to be attributed to it or to the other measures that were concurrently employed.

950 East Fifty-Ninth Street.

## CULTURE OF HUMAN BONE MARROW

### PRELIMINARY REPORT

EDWIN E. OSGOOD, M.D.

AND

ALFRED N. MUSCOVITZ, B.S.

PORTLAND, ORE.

In this report we describe briefly a method for the culture of human marrow in quantities permitting hematologic and metabolic studies. We also outline some of the problems under investigation by this method. The apparatus supplies a lung, kidney and circulation for the marrow, as it provides for the control of oxygen and carbon dioxide tension, of  $p_{H_2}$ , and of the composition of the medium; for elimination of waste products, for supply of nutrients, for removal of part or all of the culture for study, and for maintenance of sterility.

The most important feature of the apparatus is a semipermeable membrane, separating the culture from the main volume of medium. This membrane allows nutrient materials from the surrounding medium to diffuse into the culture as needed and allows waste products to diffuse out as they accumulate. Because of this equilibrium, analysis of the outflowing medium gives a good indication of conditions in the culture and of its metabolic activity.

The development of a simple technic<sup>1</sup> for obtaining human sternal marrow during life made available material suitable for culture in quantity. We have been unable to find references to any previous culture of human marrow or to cultures of animal marrow in quantities sufficient to permit hematologic or metabolic studies.

The construction and assembling of the apparatus<sup>2</sup> is indicated in figure 1:

The glass is all Pyrex except for parts *A* and *I*. The apparatus is sterilized with nascent chlorine, which is washed out first with an air stream and then with sterile medium<sup>3</sup> from the reservoir (*N*<sub>2</sub>) until the medium withdrawn from the outlets *V*<sub>1</sub> to *V*<sub>6</sub>, shows no alteration in  $p_{H_2}$ . The temperature of the thermostatically controlled, constant level water bath<sup>4</sup> (*A*) is adjusted to 37.5 C. The carbon dioxide, nitrogen and air are mixed in a large bottle and, by displacement with water, the gas flow is started through *R*<sub>1</sub> or *S*<sub>1</sub>. Fresh medium is introduced from *N*<sub>2</sub> by opening the pinch cocks (*T*<sub>15</sub> and *T*<sub>16</sub>) into the outside chamber (*O*) until the level reaches *M*<sub>5</sub> and spills over into the marrow culture chamber (*E*). Then the level of medium is adjusted in *O* to the desired level by opening *T*<sub>12</sub>, *T*<sub>18</sub> and *T*<sub>17</sub>. The medium in *E* is aspirated up into the calibrated measuring chamber (*C*) by the bulb (*X*) and *T*<sub>1</sub> is closed. Any excess above 3 or 4 cc. is withdrawn through outlet *V*<sub>2</sub> into a sterile tube, under aseptic technic.<sup>5</sup>

A sternal puncture<sup>1</sup> is performed and at once 1 cc. of the marrow is introduced through intake *B*, aseptic technic being

1. Young, R. H., and Osgood, E. E.: Sternal Marrow Aspirated During Life, *Arch. Int. Med.* 55: 186 (Feb.) 1935.

2. The semipermeable membranes we use are made by drying on the inside of a test tube a 4 per cent solution of parlodion in 25 per cent absolute alcohol and 75 per cent ether. The membranes are stored in sterile distilled water and are tested for permeability to dextrose and ability to retain serum proteins.

3. The formula for our stock medium is as follows: 9.0 Gm. of sodium chloride, 0.25 Gm. of calcium chloride, 1.5 Gm. of dextrose, 0.210 Gm. of potassium acid phosphate and 0.1 Gm. of potassium chloride dissolved in distilled water. Add to this after sterilization 20 cc. of sterile, normal sodium bicarbonate solution and dilute to 1 liter with sterile water. It should have an alkali reserve of about 45. To this may be added any ingredients the effects of which it is desired to study. The quantity of bicarbonate and dextrose may be varied, but the carbon dioxide tension must also be varied to obtain the proper  $p_{H_2}$ .

4. The water bath we use, complete with the Osgood thermostat and heating element (not shown in the diagram) is obtainable from A. H. Osgood, 6023 N. E. Hoyt Street, Portland, Ore.

5. E. E. West, professor of biochemistry, University of Oregon Medical School, gave many helpful suggestions and assisted in the glass blowing.

used. This marrow is rinsed down into *C* with the sterile medium removed through *V*<sub>2</sub> and, by opening *T*<sub>1</sub> and *T*<sub>2</sub>, the marrow is forced back inside the semipermeable membrane *F*. With a syringe and needle, sterile serum or other special nutrient material is introduced into chamber *H* through inlet *G*. After the cap is replaced on *G*, by means of bulb *W*<sub>1</sub>, air is forced through cotton *Y*<sub>2</sub> into *H* until the serum has passed down through *I* into the semipermeable membrane *J* and has passed back up through *K* to a level just below its top. If necessary, more mercury is added to side arm *L*<sub>2</sub> of manometer *L*<sub>1</sub> to balance the colloid osmotic pressure of the serum.

The further operation of the method is then as follows: Any desired gas mixture may be forced through *R*<sub>1</sub>, trap *U*<sub>1</sub>, non-absorbent cotton filter *Y*<sub>1</sub>, tube *R*<sub>2</sub>, chamber *C* and *D* to bubble through marrow culture in chamber *E*, passing out through tube *R*<sub>3</sub>, trap *U*<sub>3</sub>, and bubbling through Marriott's solution in *R*<sub>4</sub> and *R*<sub>5</sub> to give a continuous record of the carbon dioxide tension. If desired, the gas mixture may be run through *S*<sub>1</sub>, *S*<sub>2</sub> and *O*, passing out through *M*<sub>2</sub>, *R*<sub>5</sub>, and so on. Regulation of the rate of gas flow may be adjusted by screw compressor clamps *T*<sub>2</sub> and *T*<sub>7</sub>. Outflowing gas may be removed as it flows out of side arm on *R*<sub>5</sub> for analysis. Medium from *N*<sub>2</sub> may be removed through *V*<sub>2</sub> at any time for analysis and may be allowed to flow steadily or intermittently through chamber *O* by adjustment of screw compressor clamp *T*<sub>11</sub>. By releasing *T*<sub>11</sub> and closing *T*<sub>10</sub>, it may be collected in chamber *N*<sub>4</sub> and mixed with any desired additional ingredients and then permitted to flow into chamber *O*. The level of fluid in chamber *O* may be regulated by the raising or lowering of the reservoir *P*<sub>2</sub> and adjustment of stop cocks *T*<sub>12</sub> and *T*<sub>13</sub>. The outflowing medium may be withdrawn for analysis through *V*<sub>4</sub> at any time. It may be collected temporarily in *P*<sub>3</sub> by closing pinch cock *T*<sub>11</sub> and its *p*<sub>H</sub> determined by adding alcoholic neutral red solution from reservoir *P*<sub>4</sub> and comparing with standards. It may be allowed to flow continuously into calibrated reservoir *P*<sub>5</sub> and the total collection over a period of time removed for analysis through *V*<sub>5</sub> by closing *T*<sub>11</sub> and introducing filtered air under pressure by compressing *H*<sub>2</sub>. The used serum mixture may be withdrawn through *V*<sub>1</sub> at any time for analysis. The marrow culture itself may be reaspirated into *C* for measurement or withdrawal of a sample at any time by closing *T*<sub>2</sub>, opening *T*<sub>1</sub>, compressing *X*, closing *T*<sub>3</sub>, releasing *X*, closing *T*<sub>4</sub>, reopening *T*<sub>2</sub>, and withdrawing the volume of mar-

row desired through *V*<sub>2</sub>. The remaining marrow is then reintroduced into the culture chamber *E* by closing *T*<sub>2</sub> and opening *T*<sub>4</sub>.

On the marrow culture withdrawn we have been doing supravital stains, hemoglobin estimations, red cell counts, total nucleated cell counts, differential cell counts, reticulocyte counts, peroxidase stains and chemical analyses. The material is suitable for any hematologic or chemical procedure. With this method it has been possible not only to observe motile, living cells, capable of phagocytosing bacteria (fig. 2) many

days after the culture was first started, but also to determine the actual number of each type of cell present, any changes in number that may occur, and the effect of any change in oxygen or carbon dioxide tension, temperature, *p*<sub>H</sub> or medium on the rate of mitosis and number of different cell types. It is also possible to run complete metabolic experiments. Details of our results will be reported at a later date.

The following outline gives some of the problems that offer promise of solution by this method:

1. Determination of the optimal temperature, *p*<sub>H</sub>, oxygen and carbon dioxide tension, and composition of medium for multiplication of each type of cell.
2. Determination of the optimal conditions for maturation of each type of cell.
3. Development of synthetic mediums from chemically pure amino acids, hormones, vitamins, glutathione or other substances and of practical, protein-free mediums by ultrafiltration of serum, tissue juices or proteolytic digests.
4. Development of improvements in the apparatus and of simplified apparatus for multiple, short experiments.
5. Isolation of each type of cell in pure culture and determination of the origin of each cell type and of the specific stimuli that cause multiplication, maturation or metaplasia.
6. Determination of the total metabolism of mixed marrow and of each type of cell in pure culture.

Fig. 1.—Diagram of marrow culture apparatus: *A*, thermostatically controlled glass water bath. *B*, inlet for introduction of marrow. *C*, calibrated chamber for measuring volume of marrow culture. *D*, tube leading from *C* into *E*. *E*, marrow culture chamber. *F*, semipermeable membrane containing marrow culture. *G*, inlet for introduction of serum or special nutrients. *H*, calibrated reservoir for serum or nutrients. *I*, small tube leading from *H* to interior of semipermeable membrane *J*. *J*, semipermeable membrane. *K*, larger tube for outlet of serum from *J*. *L*<sub>1</sub>, manometer for balancing colloid osmotic pressure of serum mixture in *J*. *L*<sub>2</sub>, side arm of manometer containing mercury. *M*<sub>1</sub>, glass chamber, capped with rubber stopper on to which membrane *F* is fitted. *M*<sub>2</sub>, rubber ring around shoulder of stopper onto seal to chamber *O*. *M*<sub>3</sub>, hole for exit of gas from chamber *O* and for filling of *E* with medium from *O*. *N*<sub>1</sub>, inlet tube for refilling reservoir with fresh medium. *N*<sub>2</sub>, reservoir of sterile unused medium. *N*<sub>3</sub>, tube connecting reservoir with *N*<sub>4</sub> and *N*<sub>5</sub>. *N*<sub>4</sub>, calibrated supplementary reservoir for mixing additional ingredients with stock medium and connecting tube. *N*<sub>5</sub>, tube through which medium flows from *N*<sub>3</sub> or *N*<sub>4</sub> into chamber *O*. *O*, glass chamber containing medium surrounding semipermeable membrane *F*. *P*<sub>1</sub>, outlet for withdrawal of medium from *O*. *P*<sub>2</sub>, rubber tube permitting raising or lowering of *P*<sub>2</sub> and thus regulating the fluid level in *O*. *P*<sub>3</sub>, small chamber for *p*<sub>H</sub> determination. *P*<sub>4</sub>, reservoir for alcoholic neutral red solution. *P*<sub>5</sub>, calibrated reservoir for collection of used medium. *P*<sub>6</sub>, outflow tube for withdrawal of used medium. *R*<sub>1</sub> and *R*<sub>2</sub>, inlet tubes from gas supply into marrow culture. *S*<sub>1</sub> and *S*<sub>2</sub>, inlet tubes from gas supply into chamber *O*. *T*<sub>1</sub> to *T*<sub>14</sub>, pinchcocks, stopcocks or screw compressor clamps. *U*<sub>1</sub> to *U*<sub>3</sub>, traps for collection and withdrawal of water of condensation. *V*<sub>1</sub> to *V*<sub>5</sub>, outlets for aseptic withdrawal of medium or culture; each has a fine, glass tip surrounded by sterile, nonabsorbent cotton and projecting into a protecting chamber, which is kept stoppered when not in use. *W*<sub>1</sub> and *W*<sub>2</sub>, rubber bulbs with two valves for introducing air under pressure. *X*, rubber bulb without valves for aspirating marrow into *C*. *Y*<sub>1</sub> to *Y*<sub>2</sub>, sterile, nonabsorbent cotton to filter bacteria from gas and air inlets or outlets.

7. Determination of the differences in cultural characteristics of marrow from individuals of different age and sex groups and from the different types of blood dyscrasias.

8. Development of a practical test for identification and standardization of the antipernicious anemia principle.

9. Determination of the effects of deficiencies of antipernicious anemia principle, iron, copper, vitamins, hormones and amino acids on growth and maturation of normal and pathologic marrows.

10. Determination of whether addition of carcinogenic agents will produce leukemic characteristics in marrow cultures.

11. Determination of the effects of such agents as aminopyrine, benzene, pentnucleotide, radium, roentgen rays, vaccines and bacterial filtrates or cultures.

12. Determination of whether albumin, globulin, Bence-Jones protein or antibodies are produced by marrow cells and, if so, by which cell type they are formed.

13. Determination of ingredients essential for the optimal rate of formation of hemoglobin.

14. Determination of whether marrow from an allergic patient will respond with an eosinophilia in

determine whether any of the problems outlined can be solved. However, the method appears to offer sufficient promise to justify a preliminary publication with the hope that other investigators may aid us in realizing as rapidly as possible its full potentialities.

## LIFE EXPECTANCY IN CORONARY THROMBOSIS

FREDRICK A. WILLIUS, M.D.

ROCHESTER, MINN.

Considerable differences in opinion exist among physicians regarding the prognosis of coronary thrombosis. The prevailing attitude is pessimistic. Opinion, however, frequently is based solely on clinical impression and not on critical analysis of actual experience. Thus, the impressions that remain deal largely with the memory of fatal terminations, while frequently the ultimate course of the patients surviving the immediate attack is not determined. For comparative data, the reader is referred to hitherto published reports dealing with prognosis in coronary thrombosis.<sup>1</sup>

This study was undertaken to crystallize our own experience at the Mayo Clinic regarding the life expectancy of patients who have coronary thrombosis and to investigate various factors influencing early dissolution or recovery.

### MATERIAL

It was possible to obtain information regarding 370 patients who had coronary thrombosis and who lived from a few minutes to seventeen years. In 22 per cent the occlusive episode occurred while the patients were under observation at the Mayo Clinic, whereas the remaining patients were observed at a time varying from a few days to several years after the episode. The patients not observed in the course of acute attacks, however, presented histories that were classic in all respects for the syndrome of coronary thrombosis, and in the majority of the cases the electrocardiograms vividly

revealed the residual evidences of cardiac infarction. The critique for the inclusion of cases was rigid and all cases concerning which the least doubt existed regarding the previous occurrence of coronary thrombosis were discarded.

### AGE AND SEX INCIDENCE

Coronary thrombosis occurred outstandingly in the sixth and seventh decades of life; in this study, 71.9 per cent of the patients were in these decades. The greatest incidence occurred in the sixth decade, represented by 40 per cent of the entire group. A smaller

Fig. 2.—Cells from an eight day culture of marrow,  $\times 1,600$ . A, neutrophil myelocyte showing pseudopodia and the ability to phagocytize bacteria. B, eosinophil myelocyte showing pseudopodia.

the presence of the patient's serum and the specific allergen.

15. Modification of the apparatus for culture of erythrocytes in large quantities with the hope that sterile red cells of each blood group may be kept always available for instant use in transfusion.

16. Attempt to grow a pure culture of neutrophilic leukocytes in large quantities for transfusion in infections. Theoretically these might even be immunized by the addition of vaccines of the particular organism.

17. Modification of the apparatus for culture of other tissues. It seems probable that cultures of lymph nodes, spleen and similar tissues could be grown in the apparatus as it is now constructed.

18. Use of the method for culture of viruses, having living cells on the inside of the semipermeable membrane as the essential living tissue and withdrawing outside medium for continuous separation of the virus free from cells.

Investigation of these problems is in progress and the results will be reported later. Many other problems suitable for investigation will suggest themselves to any one thinking through the possibilities of the method. Of course, only actual experimentation will

but very significant incidence, 17 per cent, occurred in the fifth decade. The occurrence of coronary thrombosis was considerably less in the third (1.6 per cent), eighth (8.1 per cent) and ninth decades (1.4 per cent).

The predominance of the disease among males is a well recognized fact and the ratio in this study was 7:1; of the total number of patients, 324 were men and forty-six were women. The age distribution among males paralleled that of the total group, but interesting and significant variations occurred among females. These data reveal that while the percentage of females who are in the fourth, fifth and sixth decades is considerably less than that of males, the percentage of females in the seventh, eighth and ninth decades greatly outranks the percentage of males (table 1). Only 6.5 per cent of the females were less than 50 years of age.

These statistics bear out the clinical impression that coronary thrombosis occurs with relative infrequency among females but, when it occurs, affects the patients at a definitely later period of life than when it occurs among males. It is difficult to understand the reasons for the great discrepancy in incidence between the two sexes. After a critical analysis of the known factors, one is obliged to seek a possible explanation in the presumable superior biologic heritage of the female. The average survival period of females in general exceeds that of males by slightly more than three years.

#### THE RECURRENCE OF CORONARY THROMBOSIS

The patient always has a foreboding concerning the possible recurrence of coronary thrombosis and a question concerning this possibility invariably is directed to the physician by the patient or by the patient's relatives. In 297 cases (80.3 per cent), a single episode of coronary thrombosis occurred, while two attacks occurred in sixty-three cases (17 per cent). The average interval between the attacks was two and two-tenths years, the shortest period was twelve hours and the longest, fifteen and a half years. Eight patients (2.2 per cent) had three attacks of coronary thrombosis. An average interval of two and seven-tenths years elapsed between the first and second attacks. The shortest interval was one week and the longest was nine years. The interval between the second and the third attack averaged three and nine-tenths years; the shortest period was one week, while the longest was eight years. Only two patients (0.5 per cent) had four attacks of coronary thrombosis and great differences in the intervals between attacks occurred, varying from a few hours to ten and a half years.

It is interesting and significant that only three women (1.1 per cent) had more than one attack of coronary thrombosis.

#### GENERAL MORTALITY DATA

Death, directly and solely attributable to the heart, occurred in 191 cases (51.6 per cent); death entirely unrelated to the heart occurred in ten cases (2.7 per cent), while 169 patients (45.7 per cent) were living when this study was concluded. The patients who died from various phases of heart failure and those who were surviving when this study was made will be considered more fully in ensuing discussions.

#### CERTAIN CLINICAL DATA

The anginal syndrome was experienced by eighty-three patients (22.4 per cent) for varying periods preceding the initial attack of coronary thrombosis. The shortest interval during which the anginal syndrome endured was two weeks, the longest was fifteen years, and the average period was two and nine-tenths years.

In 167 cases (45.1 per cent) the painful seizures either persisted or appeared following the acute occlusion. The anginal syndrome developed following coronary thrombosis in 120 cases (32.4 per cent) in which these seizures had not been experienced before. Twenty-seven patients (7.2 per cent) who experienced the anginal syndrome before the occurrence of coronary thrombosis had no recurrent painful attacks afterward.

Readings of blood pressure were either normal or reduced below normal in 287 cases (77.6 per cent) after cardiac infarction. In seventy-four cases (20 per cent) the blood pressure attained hypertensive levels following the period of recovery, while, in nine cases (2.4 per cent) in which hypertension was known to have occurred prior to the occlusive episode, readings of blood pressure remained normal or below normal during the period of observation.

Localization of the region of infarction was possible in 80.2 per cent of the cases of solitary coronary thrombosis, either by postmortem examination or by electrocardiographic study. The infarct was situated anteriorly in 133 cases (44.8 per cent) and posteriorly in 105 cases (35.4 per cent), whereas localization was impossible in fifty-nine cases (19.8 per cent).

#### THE MODE OF CARDIAC DEATH

It is important to analyze critically the data regarding patients whose death was directly or indirectly the result of coronary thrombosis. Death directly ascribable to coronary thrombosis occurred in seventy cases (36.6 per cent of cardiac deaths) and the average period of survival was only five days. The shortest period of survival was five minutes, while the longest was six weeks.

TABLE 1.—Age and Sex Incidence

80 to 89	5	1.4	2	0.6	3	6.5
Totals	370	100.0	324	100.0	46	100.0

Gradual but progressive congestive heart failure was responsible for ninety-nine deaths (51.9 per cent of cardiac deaths). The average period of survival following coronary thrombosis was two and four-tenths years, the shortest interval was two months, and the longest, eleven and a half years.

In twenty-two other cases (11.5 per cent of cardiac deaths) death occurred suddenly and it was impossible to ascertain whether they represented instances of recurrent coronary thrombosis or whether death occurred from some sudden and profound physiologic disturbance in the absence of occlusion. These patients died in their respective communities. The average period of survival following known coronary thrombosis was two and two-tenths years; the shortest period was one month, while the longest period was eight years.

#### THE RELATION OF AGE AND SEX TO DEATH

The greatest number of cardiac deaths occurred when the patients were between the ages of 50 and 70 years; 73.8 per cent of the mortality was accounted for within these ages. This percentage, however has no great

significance, for 71.9 per cent of the total group of patients who had coronary thrombosis were in these decades of life. The same generalization is applicable to the analysis of data pertaining to the mode of cardiac dissolution.

As previously emphasized, a great discrepancy in the sex incidence of coronary thrombosis occurred, a ratio of seven males to one female. However, cardiac death occurred with greater relative frequency among females; the cardiac mortality among females was 63 per cent (twenty-nine patients) whereas among males it was 50 per cent (162 patients). This appears to be a significant observation, indicating that, in spite of the relative infrequency of coronary thrombosis among women, the cardiac mortality among those who have the condition is appreciably higher than it is among men. This is in part explained by the relatively higher incidence of coronary thrombosis in the later age periods among women. Death immediately related to coronary thrombosis occurred with predominant frequency among women; there were eighteen cases of such death (62.1 per cent) in contrast to fifty-two cases (32.1 per cent) among men. An almost complete reversal of percentages was found in cases in which death occurred from gradual cardiac failure. There were eighty-nine men (54.9 per cent) and ten women (34.5 per cent). Among the cases in which sudden death occurred but the exact cause of it could not be determined, there were twenty-one men (13 per cent) and only one woman (3.4 per cent). In table 2, detailed data can be found, based on the total number of cardiac deaths and not on the relative difference in percentages between the two sexes.

It is an acknowledged fact that coronary sclerosis is relatively uncommon among women and it has been stated that the relatively high mortality when the condition is complicated by coronary thrombosis is related to the fact that the heart is unprepared to meet this severe insult. This inability is said to be attributable to the lack of anastomotic coronary circulation which

\* Percentages calculated on basis of total cardiac deaths.

probably would occur, to some extent at least, when impairment of the coronary circulation was brought about gradually. In analyzing the data in this study, and accepting the existence of the anginal syndrome preceding the occlusive episode as evidence of coronary sclerosis, the explanation that the heart is unable to meet the severe insult is found to be invalid. The incidence of the anginal syndrome preceding coronary thrombosis was about equal in the two sexes: males 22.5 per cent and females 21.7 per cent. So far as the data of this study were concerned, the question of the differences in incidence of the anginal syndrome and in mortality between the two sexes remains enigmatic.

#### THE RELATION OF THE DURATION OF PAIN TO DEATH

The question whether the duration of symptoms attending sudden occlusion of a coronary artery is significant in relation to prognosis frequently has received attention. The clinical impression is that it is not significant and the data in this investigation clearly support this view. A great variation in data occurs and in order to emphasize the fact that no correlations are possible detailed analysis is submitted in table 3.

TABLE 3.—*Duration of Pain in Coronary Thrombosis in Relation to Death and Survival in 288 Cases of Solitary Occlusion \**

Duration of Pain, Hours	Cardiac Deaths	Average Period of Survival After Attack	Patients Living	Average Time After Attack, Years

\* Nine cases in which death occurred from diseases unrelated to the heart not included.

#### THE RELATION OF RECURRENT CORONARY THROMBOSIS TO DEATH

The number of patients who had, respectively, one, two, three or four attacks has been given in the section on recurrence of coronary thrombosis. Recurrent coronary thrombosis was almost limited to men, seventy cases (21.6 per cent), while only three patients (6.5 per cent) who had recurrent coronary thrombosis were women. The cardiac mortality progressively increases with recurrent coronary thrombosis. Cardiac death occurred in 141 cases (47.5 per cent) in which there was one attack, in forty-four cases (69.8 per cent) in which there were two attacks and in six cases (75 per cent) in which there were three attacks. Interestingly, the two patients who had four episodes of coronary thrombosis were still living when this report was written and will be discussed more fully later.

#### THE RELATION OF THE SITUATION OF THE INFARCT TO THE MODE OF CARDIAC DEATH IN 119 CASES OF SOLITARY CORONARY THROMBOSIS

The cardiac mortality in cases in which the infarct was situated in the anterior surface of the left ventricle (56.3 per cent) was slightly greater than it was in those cases in which the infarct was situated in the posterior wall (43.6 per cent). Only slight differences in the mode of cardiac death occurred in the two groups. Death directly attributable to coronary thrombosis occurred in eighteen cases (26.9 per cent) of anterior infarction and in twelve cases (23.1 per cent) of posterior infarction. Gradual heart failure accounted

for forty-two deaths (62.7 per cent) in cases of anterior infarction and for thirty-two deaths (61.5 per cent) in cases of posterior infarction. Sudden death of indeterminate cause occurred in seven cases (10.4 per cent) of anterior infarction and in eight cases (15.4 per cent) of posterior infarction.

#### THE RELATION OF PREEXISTING ANGINA PECTORIS TO DEATH

In the majority of cases in this study, the history of the preexistent anginal syndrome was the only conclusive evidence of coronary disease having been present before occurrence of acute occlusion. While undoubtedly other evidence existed in numerous cases, it was necessary to draw conclusions from the histories, for coronary thrombosis either occurred at the time that the patient was first observed at the Mayo Clinic or had occurred before.

Eighty-three patients (22.4 per cent) admitted the previous existence of the anginal syndrome. It is necessary to determine the difference in mortality between those patients who experienced the anginal syndrome before occlusion and those who did not. Cardiac death occurred in fifty-five cases (66.3 per cent) in which there was preexistent angina pectoris, while among those patients who had not experienced these symptoms previously, 136 (47 per cent) died from heart disease. There was no appreciable difference regarding the mode of cardiac death in the two groups.

The mortality figures as gleaned from this study permit the adoption of a somewhat more optimistic attitude toward coronary thrombosis than is generally

TABLE 4.—*The Period of Survival Following Coronary Thrombosis of Patients Whose Deaths Were Cardiac in Nature*

held. While the cardiac death rate is high, the many survivors are testimony to the fact that the heart is often capable of making a remarkable recovery from probably the most terrific insult to which it is exposed and even from repetition of such insults. Furthermore, when it is realized that more than half (52.5 per cent) of the patients survived solitary occlusion, it is not unanticipated that the death rate following multiple

occlusions is greatly increased. It is noteworthy that several patients who ultimately died from cardiac disease lived from fifteen to seventeen years following coronary thrombosis. A larger group lived from seven to twelve years. The detailed data regarding the period of survival of patients who died from heart disease are presented in table 4.

#### PATIENTS WHO, FOLLOWING CORONARY THROMBOSIS, WERE ALIVE AT THE TIME OF THE STUDY

Patients who survive coronary thrombosis, particularly those who have continued to live in reasonably

\* Percentages calculated on basis of total in each group.

good health for a considerable number of years, are of unusual interest and merit careful study. It is evident that patients who were alive when the study was completed may have died before this paper is published. However, they will be referred to as alive "now."

It is true that many patients living at this time are ultimately destined to die from heart disease. In an investigation of this character it is impossible to obtain accurate information regarding the care exercised in the manner of living by many patients following coronary thrombosis. This could be determined only by almost continuous contact with them over the ensuing years and obviously such contact was not possible in the great majority of instances. There is no doubt that the strict maintenance of a carefully individualized regimen plays an important part in the life expectancy of the patients who survive the immediate perils of sudden coronary occlusion.

One hundred and sixty-nine patients (45.7 per cent) are alive. It is noteworthy that the six patients who had coronary thrombosis between the ages of 30 and 40 years are all living. The comment frequently has been heard that coronary thrombosis in the earlier age periods is likely to be fatal, because, it is said, lack of compensatory anastomotic vascular channels leaves the heart unprepared for the accident. This study does not bear out that presumption, because the incidence of survival in the fourth and fifth decades is greater than the cardiac mortality (table 5). As the cases in the later decades are studied, it becomes evident that mortality overbalances survival.

Relatively more men than women have continued to survive coronary thrombosis. This is clearly shown when comparative data on death and survival are analyzed. Of the total number of patients, 87.5 per cent were men but 153 (90.9 per cent) of the surviving

patients are men, while 162 (84.8 per cent) men died from cardiac disease. Of the total number of patients, 12.4 per cent were women; but there were sixteen (9.1 per cent) women among the survivors, while twenty-nine (15.2 per cent) women were included among the cardiac deaths.

Among the patients living are twenty-two who experienced multiple episodes of coronary thrombosis. Eighteen had two episodes; two experienced three episodes, and two others survived four attacks (table 6). The latter two patients merit further comment, as their continuity of life has defied all prognostication. One patient, now 60 years of age, a resident of Rochester, has been under close observation for twelve years and remains in surprisingly good condition under a strict cardiac regimen. The other patient, now 76 years of age, resides in a neighboring town and has been followed through correspondence. He is bedridden owing to recurrent congestive failure but has survived his first attack for five years.

The situation of the infarct appeared to have little influence on death or survival. Sixty patients (50.4 per cent) of those who have anteriorly situated infarcts are living, while fifty-one (42.8 per cent) who have posterior infarcts also survive.

It was important to determine the present condition of the survivors (table 7) and it was encouraging to note that seventy-two (42.6 per cent) reported themselves in good health while presumably observing only indifferent regimens. Thirty-nine (23.1 per cent) of the survivors remain in good health by adhering to definite restrictions. Forty-nine patients (28.9 per cent) complain of the anginal syndrome, six (3.6 per cent) are bedridden owing to congestive heart

No patients were less than 30 years of age, the incidence in the fourth decade of life was 1.6 per cent, while 17 per cent of the patients were in the fifth decade. There was a great predominance of males over females; the ratio was 7:1.

2. Solitary coronary occlusion occurred in 80.3 per cent of the cases; two episodes occurred in 17 per cent, three attacks in 2.2 per cent, and four episodes in 0.5 per cent of the cases.

TABLE 7.—Patients Living and Their Condition at Conclusion of Study\*

Decade of Life	Condition of Patients									
	Good Health		Well with Restrictions		Have Anginal Syndrome		Congestive Failure, Bedridden		Had Cerebral Vascular Accident	
	Patients	Per Cent	Patients	Per Cent	Patients	Per Cent	Patients	Per Cent	Patients	Per Cent
30 to 39	3	1.8	0	0.0	2	1.2	1	0.6	0	0.0
40 to 49	20	11.8	4	2.4	12	7.1	2	1.2	0	0.0
50 to 59	30	17.7	12	7.1	20	11.8	0	0.0	1	0.6

70 to 79	3	1.8	4	2.4	1	0.6	1	0.6	0	0.0
Total number and percentage	72	42.6	30	23.1	49	28.9	6	3.6	3	1.8

\* Percentages based on total number of patients living.

3. Death directly attributable to the heart occurred in 51.6 per cent of the cases, while other diseases such as pneumonia, cancer and nephritis accounted for the death of 2.7 per cent of patients. The patients surviving at the conclusion of the study comprised 45.7 per cent of the group.

Of the cardiac deaths 36.6 per cent were ascribable to coronary thrombosis; gradual cardiac failure accounted for 51.9 per cent, and sudden death of uncertain mechanism for 11.5 per cent.

4. While the incidence of females in this study was relatively small (12.4 per cent) their cardiac death rate was considerably greater than among males: females 63 per cent and males 50 per cent.

5. There was no correlation between the duration of pain in coronary thrombosis and death or survival.

6. The cardiac death rate increased progressively with recurrent coronary thrombosis. Among cases of solitary coronary occlusion the cardiac mortality was 47.5 per cent, among cases in which there were two attacks 69.8 per cent, and among those in which three attacks occurred 75 per cent.

7. The patients living at conclusion of this study comprised 45.7 per cent of the group. Of these, 42.6 per cent reported themselves to be in good health, 23.1 per cent were well while living a restricted life, 28.9 per cent had recurrent anginal attacks, 3.6 per cent had congestive heart failure, and 1.8 per cent had had cerebral vascular accidents.

failure, and three (1.8 per cent) have suffered cerebral vascular accidents at various periods following coronary thrombosis.

When the surviving patients are considered in relation to the complete group of patients comprising this study, it is found that 19.5 per cent are in remarkably good health and 10.5 per cent are getting along well with restrictions; in the aggregate this results in 30 per cent of the group.

SUMMARY AND CONCLUSIONS

1. In this study of 370 cases of coronary thrombosis, in 71.9 per cent the thrombosis occurred when the patients were between the ages of 50 and 70 years.

Potato Famines and Scurvy.—Cooking and canning diminishes the vitamin C values of different foods in very different degrees, and milk and cooked potatoes, while not having high concentrations of this vitamin, may be among the most important sources of it. In northern Europe, including Ireland, scurvy was very common up to the time of the introduction of the potato after the discovery of America; then, as potato culture became common, scurvy became uncommon; and, during the past century, a failure of the potato crop over a wide area has usually been followed by an epidemic of scurvy during the following winter or early spring.—Sherman, H. C.: Food and Health. New York, Macmillan Company, 1934.

## Clinical Notes, Suggestions and New Instruments

### INTUSSUSCEPTION OF JEJUNUM FOLLOWING GASTRO-ENTEROSTOMY

JULIUS GOTTESMAN, M.D., NEW YORK

Intussusception of the small intestine into the stomach through the stoma of a gastro-enterostomy following operation is an infrequent occurrence. The literature contains only thirty-nine reported cases. The condition probably occurs more often but is not recognized because of a general lack of knowledge of the possibility of such a complication.

Most of the reported cases were of the acute type, characterized by a sudden onset without any preliminary signs. The earliest case occurred six days after operation.<sup>1</sup> The symptoms and physical signs are those of high intestinal obstruction. The onset is with pain in the upper part of the epigastrium and vomiting, at first gastric contents, then bile and later blood. The abdomen becomes rigid, distended and tender. In some of the cases (about 50 per cent) a tumor mass is palpable. The course is rapidly downhill unless an immediate operation is performed. The usual operative procedure is a reduction of the intussusception and in some instances resection. The condition may be confused with a perforating bleeding ulcer, an error that was made in the case here reported.

Besides the acute form, a chronic or intermittent form may occur, as has been suggested by Sibley.<sup>2</sup> In his case there was a feeling of tightness in the midepigastrium and inability to endure anything tight about the waist. The attacks came on from one to three hours after meals. At fluoroscopy it was found that a loop of jejunum had invaginated into the stomach, although at the time of operation the intussusception had spontaneously reduced itself.

It is essential, because of the high mortality of this type of intussusception, to recognize the possibility of this complication when confronted with an acute surgical condition of the abdomen at any time interval after a gastro-enterostomy. It is also important to entertain the likelihood of a chronic form of jejunal intussusception to account for unexplained symptoms following gastro-enterostomy.

#### REPORT OF CASE

The following case was observed in the surgical service of the Montefiore Hospital:

*History.*—E. S., a man, aged 43, was admitted to the hospital Nov. 14, 1932, because of multiple arthritis and spondylitis.

In 1917 he began to complain of gastric symptoms due to a gastric ulcer. In December 1931 he was operated on for a pyloric stenosis secondary to a gastric ulcer, at which time a posterior gastro-enterostomy was performed. The operation relieved all gastric complaints. The arthritis began in 1923. Examination on admission to the hospital showed a generalized joint involvement. An x-ray examination of the gastro-intestinal tract showed a well functioning gastro-enterostomy.

Dec. 27, 1933, at 3:30 a. m., a sharp pain, cramplike in character, developed in the right upper quadrant of the abdomen, and he vomited about 700 cc. of bloody fluid. Examination revealed a soft abdomen, somewhat tender in the right upper quadrant. There was no rigidity and no rebound. The temperature and pulse were not elevated. An enema given at 5 a. m. was effectual and did not contain any blood.

When seen at 10 o'clock there was some tenderness and rigidity in the upper part of the abdomen. A mass could be felt in the region of the umbilicus, about the size of an orange, extending toward the left upper quadrant. The temperature, pulse and blood count were normal.

The impression was that we were dealing with an acute gastric hemorrhage from a gastric or gastrojejunal ulcer, with the possibility of a slow perforation and localized peritonitis. Opinions as to indication for operation varied. Some felt that immediate laparotomy was indicated because of the development of the mass. Others felt that the active bleeding

warranted more conservative measures. Another suggestion made was that we were dealing with a carcinoma of the stomach with ulceration and hemorrhage.

Supportive treatment with transfusions was decided on. The patient became progressively worse, bloody vomiting continued, and he soon died.

*Autopsy.*—When the abdomen was opened the stomach was found to fill the upper half of the abdominal cavity, reaching as far down as the umbilicus. A large mass could be felt inside the stomach. The stomach, on being opened, was found to contain about 0.5 liter of bloody fluid. Through the stoma of the gastro-enterostomy on the posterior wall of the stomach about 15 cm. of invaginated jejunum protruded into the lumen. This intussuscepted mass was almost completely gangrenous.

#### CONCLUSION

There is a possibility of an acute intussusception through a gastro-enterostomy opening following operation. Because of the high mortality of this complication, immediate recognition and operation are imperative. The chronic or intermittent form may explain some of the gastric symptoms following gastro-enterostomy.

### AN IMPROVEMENT OF SOUTHEY'S TUBES

CLIFTON B. LEECH, M.D., PROVIDENCE, R. I.

The use of small cannulas, inserted into the feet or legs by means of trocars, in cases of massive edema, for the purpose of draining off the edema fluid was introduced by Southey in 1877. In recent years attention has been redirected to these tubes by Paul D. White and others.

Drainage of fluid by means of these in cases of obstinate edema, not relieved in other ways, is often very satisfactory. Frequently, however, the tubes drain well for only a comparatively short period, soon becoming plugged. There seems to be two reasons for this: first, the small diameters of the tube and its openings and, second, its smooth, cylindric contour, which permits the tissues to adhere closely to it, thereby tending to plug the openings and prevent drainage.

A, the improved tube; B, the trocar; C, a cross section of the tube as it lies embedded within the tissues.

There seems to be no objection to using tubes with twice the diameter of the ordinary Southey cannula, with openings correspondingly large. In order to overcome the tendency of the edematous tissues to fit tightly over the openings so as to plug them, it seems desirable to have a tube so designed as to be firmly grasped by the tissues and yet at the same time to offer free channels for drainage. This has been accomplished by milling four grooves lengthwise of the tube. This leaves four projecting corners, which are grasped by the tissues, tending to keep them stretched across the grooves and away from the drainage openings, which are staggered within them.

In tests devised to compare the efficiency of these tubes with the ordinary Southey tubes, use was made of fine sponge rubber sealed within a thin rubber envelop and fed with water under

slight gravity pressure. It was found that the improved instrument drained water from this device approximately six times as rapidly as did the ordinary Southey tube. In actual practice the improved tubes have been much more efficient than the old and have shown almost no tendency to plugging. The tubes were used recently in the thighs and feet of an adult patient with intractable edema due to the nephrotic type of renal disease. This patient did not respond to any type of diuretic and was in such a state of discomfort, owing to the general anasarca, that the tubes were inserted merely in the hope of lessening the tension of the waterlogged tissue. There immediately ensued a profuse flow, amounting to more than 5 liters during the first twenty-four hours and continuing for more than a week, at the end of which time the tubes either fell out because of shrinkage of the tissues or were removed. In this case there was marked reduction of ascites as the drainage continued through the tubes. Incidentally, as the edema was drained off, a spontaneous diuresis occurred, as if reduction of intra-abdominal pressure permitted an improvement in renal function. The diuresis has continued, so that it has not been necessary to reinsert the tubes, although six weeks has passed since their removal.

The designing and tooling of these improved tubes was accomplished with the invaluable cooperation of Mr. Ernest J. Beattie of Fall River, Mass., who turned out, by hand, the experimental models. These tubes and trocars are now available in stainless, rustless metal of extreme hardness.

## Special Article

### COMMENTS ON THE COPELAND FOOD, DRUGS, THERAPEUTIC DEVICE, AND COSMETIC BILL

AS REPORTED BY THE COMMITTEE ON INTERSTATE  
AND FOREIGN COMMERCE TO THE HOUSE  
OF REPRESENTATIVES, MAY 22, 1936

WILLIAM C. WOODWARD, M.D.

Director, Bureau of Legal Medicine and Legislation, American  
Medical Association

CHICAGO

The Copeland food, drugs, therapeutic device, and cosmetic bill,<sup>1</sup> which passed the Senate May 28, 1935, was reported<sup>2</sup> to the House of Representatives by the Committee on Interstate and Foreign Commerce, May 22, 1936, with proposed amendments and with the recommendation that the bill as thus amended be enacted. The bill has therefore taken its place on the House calendar. An effort will probably be made to have it brought up under a special rule within the next few days.

The process of attenuating and debasing this legislation began immediately after the introduction of the Tugwell bill,<sup>3</sup> June 12, 1933. It has been continued vigorously right up to the present moment. The bill as reported is weaker than it was when it was referred to the committee, and it will probably be better for the public if in the end the bill is not enacted, unless it can be strengthened on the floor of the House or in conference. To enact bad legislation in the hope of being able to strengthen it by later amendments is not likely to give satisfactory results and will almost certainly retard the passage of the needed laws.

Comments on some of the more important features of the Copeland bill as reported by the House com-

mittee follow. Readers who are interested in this legislation should write or telegraph their views immediately to their respective senators and representatives. It is possible that the bill will be acted on before this issue of THE JOURNAL reaches its readers, but there will still remain time for the strengthening of the bill in conference.

#### UNCERTAIN STANDARDS FOR DRUGS

The House Committee on Interstate and Foreign Commerce has unfortunately left the standards proposed by the bill for pharmacopeial and formulary drugs in the same unsound and deceptive state in which they were when the bill left the Senate. It has been made so clear recently by the courts that there are limits to the authority of Congress to delegate legislative power to other agencies that it seems rather remarkable that the committee should have seen fit to acquiesce in the delegation to three unnamed, private corporations, of the right to fix through the United States Pharmacopeia, the Homeopathic Pharmacopeia of the United States, and the National Formulary, and through supplements to these publications, issued daily or hourly if the representatives of these corporations deem it proper, the legal standards for drugs throughout the United States, without limitation of any kind, without defining the respective jurisdictions of each such legislative agency, and without providing in any way for the making of standards for drugs after the courts shall have declared this delegation of legislative power to be unconstitutional. Even the Secretary of Agriculture is to be required, under the terms of this bill, to give ample notice and a public hearing before he proceeds to promulgate regulations under the legislative authority conferred on him; and after he has promulgated a regulation it must be published in the Federal Register and the world be thus officially notified of its promulgation, and a reasonable time must elapse thereafter before the secretary's regulations become effective. But the publishers of the United States Pharmacopeia, the Homeopathic Pharmacopeia of the United States and the National Formulary, and of supplements to them, are, the committee proposes, to be at liberty to formulate standards in the secrecy of their respective office, without notice and without hearing, and to make any minimum technical publication of them, and such standards are to become effective instantly; and noncompliance is to mean fine, imprisonment and possible seizure by the government of the drugs thus suddenly made contraband by the fiat of certain private citizens.

But quite as remarkable is the fact that the bill does not really require compliance with the standards that it thus authorizes to be established; for no drug sold under a name recognized by the United States Pharmacopeia or by the Homeopathic Pharmacopeia of the United States or by the National Formulary or purporting to be a drug the name of which is so recognized, although differing from the standard of strength therein set forth, is to be regarded as adulterated if its own standard of strength, whatever that may be, is plainly stated on the label. Every manufacturing pharmacist is at liberty to use the pharmacopeial or formulary name and to fix his own standard for the preparation to which he assigns it, and the retail pharmacist who receives an order for a drug under its official name will not violate the provisions of the pending bill, if it should be enacted, if he delivers a drug of

1. S. S. Seventy-Fourth Congress.

2. H. R. Report No. 2755, Seventy-Fourth Congress.

3. S. 1944, Seventy-Third Congress.

one-half or ten times the official strength, provided only that on the label he indicates plainly, in such way as he thinks proper, the strength of the drug that he sells.

#### FRAUDULENT ADVERTISING OF DRUGS AND THERAPEUTIC DEVICES TOLERATED

The Copeland bill, as it passed the Senate, provided that advertisements of drugs or devices claiming for them any therapeutic effects in the treatment of Bright's disease, cancer, tuberculosis, poliomyelitis (infantile paralysis), venereal diseases, or heart and vascular diseases should be deemed false. It provided, however, that such advertisements, if not otherwise false and misleading, (1) might be sent to members of the medical and pharmaceutical professions and be printed in the scientific periodicals of those professions and (2) might be disseminated for the purpose of public health education by persons not commercially interested in the sale of the drugs and devices to which such advertisements related. The House committee, however, proposes to strike out the exemption permitting the dissemination of such advertisements for the purpose of public health education and to give the Secretary of Agriculture authority to establish exemptions in favor of drugs and devices advertised for the treatment of the diseases named above with respect to which, in his opinion, representations as to therapeutic effects would not be in fact false and misleading; in other words, authority to determine whether a drug or device does or does not have a therapeutic effect on any or all of the diseases named and to permit its advertisement for the treatment of such of them as he believes may be benefited. The committee has recommended, too, that no advertisement of any drug shall be deemed to be false and misleading within any meaning whatever of the section defining false advertisements, if it is disseminated only to members of "the medical profession" and appears only in the scientific periodicals of that profession. The significance of the committee's recommendation will be best understood when it is remembered that the term "medical profession," wherever it is used in the bill, means "the legalized professions of the healing art" and therefore includes not only practitioners of medicine but also dentists, pharmacists, chiropractors, naturopaths, osteopaths, midwives, registered nurses, optometrists, chiropodists, and possibly other similar classes. Why the dissemination of false and misleading advertisements of drugs among such practitioners of these classes should be legalized is not clear.

The bill proposes no fixed standard for the labeling or advertising of drugs not named in either pharmacopeia or in the formulary or for therapeutic devices. It leaves the falsity or the misleading character of such labeling or advertising to be determined after the event, according to the opinion prevailing at the time of the sale, in the place where the sale is made. For the labeling or advertising of a drug or a device is not to be deemed false or misleading if it is supported by substantial and reliable opinion of doctors of medicine, or of dentists, pharmacists, midwives, chiropodists, osteopaths, chiropractors, naturopaths and other similar practitioners of the healing art, each within his own field, licensed by law in the state or territory where the drug or device to which the action relates is held, sold or distributed. Obviously such opinions will vary from time to time and from place to place, and no manufacturer or dealer can tell in advance just what they will be at any particular time and any particular place.

Incidentally, just what is to constitute "medical opinion" in determining the truth or falsity of claims made in the labeling or advertising of foods and cosmetics is not clear, for the statutory definition of "medical opinion" laid down in the bill seems to relate only to drugs and devices, the language referring to the place where the drug or device is held, sold or distributed, and being silent as to foods and cosmetics.

#### CONCEALMENT OF INGREDIENTS OF FOODS AND DRUGS AUTHORIZED

As it passed the Senate, this bill provided that a food fabricated of two or more ingredients should bear on its label the common or usual name of each such ingredient, with certain exceptions not relevant here. The bill as recommended by the House Committee on Interstate and Foreign Commerce, however, provides that the nature of the ingredients of any proprietary food need not be thus disclosed to the consumer, if they have been disclosed to the Secretary of Agriculture and if disclosure on the label would give to competitors information they could not otherwise obtain. With respect to drugs, in which the need for the disclosure of ingredients is even more urgently needed than it is in the case of foods, the committee has been even more favorable to secrecy with respect to quack nostrums, although it has failed to recommend secrecy for the ingredients of mixtures prescribed by physicians. The bill as it passed the Senate required that the label of a drug fabricated of two or more ingredients bear the name of each active ingredient, including any alcohol, except where the Secretary of Agriculture found compliance with this requirement impracticable. Obviously this requirement is applicable to drugs fabricated on physicians' prescriptions and when such drugs enter interstate commerce, as interstate commerce is defined by this bill, they must be labeled according to the requirements of the bill. But the House committee, in reporting this bill, recommended that the disclosure of the formula on the label of patent proprietary medicines, except as to alcohol, be not required if the ingredients are fully and correctly disclosed to the Secretary of Agriculture. In the case of food, secrecy of formula is assumedly to be permitted only to protect the manufacturer from his competitors, for registration of the names of the ingredients with the secretary, as a substitute for printing them on the label, is to be permitted only when disclosure on the label would give competitors that which they could not otherwise obtain. But, in the case of drugs, secrecy is apparently quite as much for the purpose of keeping the patient in the dark as it is for the purpose of concealing the nature of the ingredients from competitors for it is to be permissible under all conditions whatever.

#### DEFINITIONS OF "MEDICAL PROFESSION" AND OF "MEDICAL OPINION" ARE ARBITRARY AND CONTRARY TO ACCEPTED USAGE

While this bill assumes to define standards of quality and truthfulness for foods, drugs, therapeutic devices and cosmetics, and for labeling and advertising relating to them, it starts out with definitions of "medical profession" and "medical opinion" that are contrary to established fact and therefore false. When the bill says that every person who is licensed to practice any form of the healing art by the law of the state or territory in which he resides is a member of the medical profession, it simply misstates the fact; for midwives,

osteopaths, chiropodists, chiropractors, pharmacists, nurses, optometrists and others of similar types are not members of the medical profession. To say, as the bill does, that the opinion of members of any such group within its own field constitutes "medical opinion" is equally false.

DELEGATION OF RULE MAKING AUTHORITY TO  
THE SECRETARY OF AGRICULTURE; ABANDONMENT OF PROPOSED ADVISORY  
BOARDS

The delegation of legislative authority to the Secretary of Agriculture proposed by this bill is probably within constitutional limits. The duties that he will be called on to perform under that grant of authority are, however, certainly far beyond the power of any one man to perform properly. Under the authority that it is proposed to grant, it will be necessary for the secretary to rely largely on the officers and employees of the Department of Agriculture not only for information and advice but also for the actual exercise of discretion, and the delegation of discretion to subordinates will not only be unlawful but will deprive the people of the benefit of the judgment of the secretary himself. If Congress intends that the subordinates in the Department of Agriculture shall make the rules that are to be promulgated under this bill, it would be better for the bill so to provide. It must be remembered, however, that permanent officers and employees in the government service almost invariably adopt in a short time a strictly official way of looking at matters and, unless that manner of thinking is offset in some way, rules are apt to be adopted by such officers and employees that do not adequately reflect the views or needs of industry or of the public.

For that reason it seems unfortunate that the House Committee on Interstate and Foreign Commerce should have proposed to do away entirely with all the advisory committees proposed in the Senate bill. Undoubtedly the number and variety of committees proposed by that bill was unnecessary and unwise, but certainly a middle course could have been found. If no such course could be found, then at least the present plan should be continued, whereby rules are promulgated by the joint action of the Secretary of Agriculture acting with the Secretary of the Treasury, who can best advise, with respect to human health, through the Public Health Service, and acting with the Secretary of Commerce, who is best able to advise with respect to the commercial interests involved. By vesting in the Secretary of Agriculture, as the bill as just reported now proposes to do, autocratic legislative power, along with the executive functions necessarily vested in him, and the judicial duties—including the duty of determining, even after he knows that the law has been violated, whether he will or will not refer an offense to the courts or exercise clemency in his own right—comes near to creating him an autocrat.

ENFORCEMENT OF LAW CUMBERSOME, EXPENSIVE  
AND SLOW

Responsibility for the enforcement of this bill is to be divided between the Secretary of Agriculture and the Federal Trade Commission. The jurisdiction of the secretary is to be limited to matters relating to adulteration and misbranding. He is to have no jurisdiction over advertising. In fact, false advertising is not a criminal offense under this bill. If the secretary

believes that any one is advertising in a manner forbidden by this bill, the most he can do is to report the matter to the Federal Trade Commission for action.

Even though the Secretary of Agriculture knows that some one is guilty of adulterating or misbranding foods, drugs, therapeutic devices or cosmetics, or of distributing a food from a factory that has no permit, when one is required, he need take no action. If the infraction of the law is of a minor character—and apparently the secretary is the sole judge of that fact—and the secretary believes that the purposes of the act can be best accomplished by a written notice or warning, he may limit action to the giving of such notice or warning. But if the offense does not come within that class, the most he can do in the first instance is (1) to institute action looking toward the seizure of the offending foods, drugs, therapeutic devices or cosmetics, if they are still within reach, or (2) to serve notice on the person against whom criminal proceedings are contemplated, if he can be found, giving him an opportunity to be heard on the question of a possible violation of the law, and, on cause shown satisfactory to the secretary, a further opportunity to review the secretary's tentative decision to report the case to the United States attorney for prosecution. If after all this the secretary deems it proper to do so, he may report the case to the United States attorney, who thereafter institutes prosecution in the trial court and sees that the case is properly carried up through the appellate courts if necessary.

The procedure following the reference of a case of supposed false advertising by the Secretary of Agriculture to the Federal Trade Commission is even more cumbersome and costly to the taxpayer. The commission must first find that it has reason to believe that the advertisement is false and misleading. If it so decides, it must serve on the supposed offender a complaint and fix a date for a hearing not less than thirty days after the service of the notice. The testimony taken at this hearing must be reduced to writing and filed in the office of the commission. If the commission finds that the advertisement is false, it must make a written report of its findings and serve on the advertiser an order to cease and desist from the dissemination of the false advertisement. If he does not comply, the commission may then apply to the appropriate circuit court of appeals to enforce the commission's order. Until the court has determined the questions involved, after notice to the advertiser, and has affirmed the commission's order, the advertiser may continue to disseminate the advertising in controversy, if he so desires, and this may be a period of months or even years, much longer than the useful life of any ordinary advertising matter.

Why all these obstacles should be placed in the way of the prosecution of offenders against a law of the character of that now under consideration is not clear. Importers, manufacturers and dealers in foods, drugs, therapeutic devices and cosmetics and advertisers of such products, constitute a class probably far above the average in intelligence. They should be able to understand the law and to comply with it. If they cannot, the law should be made sufficiently intelligible to enable them to do so. But certainly, as things now stand, there seems to be manifested on their behalf a tender solicitude lest one of them be convicted of an offense that he did not commit, a solicitude that is not shown for any other class of potential offenders.

## Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION OF THE FOLLOWING STATEMENT AND REPORT.

HOWARD A. CARTER, Secretary.

### AN APPRECIATION

The Council on Physical Therapy wishes to acknowledge, with appreciation, the efforts of the following consultants, who have so generously contributed their time to the Council by assisting in the investigation of apparatus and the consideration of other problems that have confronted the Council: Drs. Fred L. Adair, Francis Heed Adler, M. Herbert Barker, Simon Benson, William Bierman, Walter M. Boothby, Curtis Burnam, Fremont Chandler, Herman Chor, Eliot R. Clark, Harry Culver, Arthur Curtis, L. F. Curtiss, Géza de Takáts, Alex Day, Cecil K. Drinker, C. W. Edmunds, F. H. Everhardt, Bernard Fantus, Hart Fisher, Jonas Friedenwald, Sanford Gifford, A. Bruce Gill, Samuel Gordon, K. G. Hansson, Austin Hayden, Allan Hemingway, Yandell Henderson, John Sivery Hibben, Kenneth Karl Jones, Arthur K. Koff, A. J. Kotkis, Richard Kovacs, Herman L. Kretschmer, Henry Laurens, Philip Lewin, Franklin P. Lowry, John MacNie, M. L. Mason, M. C. L. McGuinness, A. R. Morrow, Bernard Mortimer, S. A. Morton, Tell Nelson, Horace Newhart, Josef B. Nylin, Clarence A. Patten, George Pfahler, Lewis Pollock, John Pribble, Francis Rackemann, Charles Shannon, William O'Neill Sherman, E. M. Smith Jr., K. W. Stenstrom, Norman E. Titus, Clifford B. Walker, Heinrich Wolf, Mrs. Mary L. Abbey, Miss Gertrude Beard, Mrs. Ardis T. Monk, and Mr. S. L. Osborne.

### EVEREADY PROFESSIONAL CARBON ARC LAMP, MODEL L-1, ACCEPTABLE

Manufacturer: National Carbon Company, Inc., Carbon Sales Division, Cleveland.

This lamp is a carbon arc type generator and is offered by the manufacturer to the medical profession for use in its professional application of carbon arc lamp radiation. The National Carbon Company has no specific recommendation for application of this lamp in any therapeutic procedure. Carbon arc lamps are frequently used by the medical profession in the general fields of pediatrics, tuberculosis and dermatology, and in some other specialized fields. The application can be made only by the physician who is in charge of the particular case.

Eveready Professional model L-1.

The lamp mechanism operates automatically and uses 10 mm. by 12 inch Eveready carbons. The magnetic flux created by the solenoid is carefully designed to coincide with the mechanical balance of the carbon feeding mechanism. This feature provides for maintaining a uniform intensity and volume of illumination by automatically feeding the carbon intermittently when the arc gap becomes of sufficient length to cause a change in the arc voltage.

A transformer, mounted in the stand base, provides for utilizing a comparatively small current input by stepping the voltage down from 110 volts to 50, increasing the amperage proportionately, making it possible to operate on ordinary 15 ampere outlet.

The lamp is mounted in a heavy 16 inch spun and polished aluminum reflector, which is provided with a removable protecting transparent screen. It is equipped with a tilting yoke, which permits directing the light rays from every practical angle. All current carrying parts are fully enclosed and protected in a manner making it impossible for the operator to come in contact with them.

The stand permits raising the lamp to a height of approximately 6 feet. It is provided with an adjustment clamping arrangement which locks the height adjusting tube rigidly with a minimum of pressure of the adjustment knob. The stand base has rubber tire casters and a durable double pole tumbler type switch for turning the lamp on and off. The 15-foot approved service heater cord is plugged into a receptacle mounted into the side of the base.

The approximate operating characteristics of the lamp are as follows: input power, 1,650 watts at 112 volts 60 cycle alternating current; average amperes at arc, 30; transformer efficiency, 85 per cent, and temperature rise of transformer after two hours' continual burning, 47 C.

Experiments with representative specimens of untanned human skin indicate that at a distance of 3 feet from the lamp, when the lamp is burning Eveready Therapeutic C carbons, an erythema is produced in about four minutes. At a distance of 2 feet the same degree of erythema is produced in about two minutes. More susceptible individuals will respond in a somewhat shorter period of time, and more resistant individuals will require a somewhat longer period of exposure to produce the same degree of erythema.

The lamp was tested in a clinic acceptable to the Council and the investigator reported that the lamp gave satisfactory service. Therefore, the Council on Physical Therapy voted to include the Eveready Professional Carbon Arc Lamp, Model L-1, in its list of accepted apparatus.

## Committee on Foods

THE COMMITTEE HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT.

FRANKLIN C. BING, Secretary.

### AMENDMENT OF COMMITTEE RULES GOVERNING USE OF THE SEAL

The first paragraph of the section "Rules Governing Use of the Seal" of the Rules and Regulations, May 1935, page 10, has been amended by addition of a second sentence, making the paragraph read:

The Seal may be used on the container label or in connection with any form of advertising effort or display related to the product, after official notification of acceptance by the Secretary of the Committee. In all cases the seal shall appear only on label or advertising pieces which prominently identify the accepted article and the responsible manufacturer or distributor.

### ACCEPTED FOODS

THE FOLLOWING PRODUCTS HAVE BEEN ACCEPTED BY THE COMMITTEE ON FOODS OF THE AMERICAN MEDICAL ASSOCIATION FOLLOWING ANY NECESSARY CORRECTIONS OF THE LABELS AND ADVERTISING TO CONFORM TO THE RULES AND REGULATIONS. THESE PRODUCTS ARE APPROVED FOR ADVERTISING IN THE PUBLICATIONS OF THE AMERICAN MEDICAL ASSOCIATION, AND FOR GENERAL PROMULGATION TO THE PUBLIC. THEY WILL BE INCLUDED IN THE BOOK OF ACCEPTED FOODS TO BE PUBLISHED BY THE AMERICAN MEDICAL ASSOCIATION.

FRANKLIN C. BING, Secretary.

### DURKEE'S BRAND OLEOMARGARINE

Manufacturer.—Durkee Famous Foods, Inc., Chicago.

Description.—Oleomargarine prepared from oleo oil, refined neutral lard, pasteurized cultured milk, refined cottonseed oil, salt and monostearyl sodium sulfoacetate.

Manufacture.—Essentially the same as described for Durkee's Vegetable Oleomargarine (THE JOURNAL, Aug. 3, 1935, p. 369).

Analysis (submitted by manufacturer).—

	per cent
Moisture .....	15.8
Ash (other than sodium chloride) .....	0.1
Sodium chloride .....	3.0
Fat (ether extract) .....	80.0
Protein (N X 6.25) .....	0.5
Lactose .....	0.6
Sodium benzoate .....	none
Glycerin derivative .....	0.4

Calories.—7.2 per gram; 204 per ounce.

Claims of Manufacturer.—For use as a bread spread and for cooking, baking and frying.

### BONNIE FARMS BRAND EVAPORATED MILK

Distributor.—United Fruit Stores, Providence, R. I.

Manufacturer.—Sheffield Condensed Milk Company, Inc., New York.

Description.—An unsweetened, sterilized evaporated milk, the same as Sheffield "Sealect" Brand Unsweetened Evaporated Milk (THE JOURNAL, Feb. 3, 1934, p. 373).

## THE PRESENT STATUS OF RHEUMATISM

The authors<sup>1</sup> of the second American review on the present status of knowledge of rheumatism and arthritis, prepared at the request of the American Committee for the Control of Rheumatism, point out that "rheumatism" was not considered to be a problem until, about twenty years ago, research in the field disclosed that a problem existed. Certainly it presents a social and economic problem as well as a medical one. Rheumatism, judging its incidence from the proportion of the population that actually complains of its symptoms, is twelve times as prevalent as cancer and one fortieth as fatal. The morbidity is 10 per cent among all persons who have passed the age of 40 years. The disease is more frequent among outdoor than among indoor workers, more prevalent in rural than in urban communities and twice as frequent among the poor as among the well-to-do. Yet it is possible that these factors of age and environment will become of subordinate importance as studies on the soil presented by the individual patient, and on the physiology of the joints, are prosecuted with greater industry.

The authors of the review are impatient with the too frequent new classifications of rheumatic disease—"classifications too often the 'arbeit' of one who feels that only thereby can he attain recognition as a specialist for rheumatism." They retain the classification employed in the previous review of rheumatic diseases: (1) those attributable to trauma, (2) those attributable to known infections, (3) those possibly or probably attributable to infection or related toxins, (4) those of which the chief characteristic is degenerative change in tissue, (5) those of which the chief or only obvious characteristic is some recognizable or suspected chemical derangement, and (6) a miscellaneous group of unclassifiable types. A survey based on this classification yields some evidence of progress in knowledge of arthritis.

1. Hench, P. S.; Bauer, Walter; Fletcher, A. A.; Ghrist, David; Hall, Francis, and White, T. P.: The Present Status of the Problem of "Rheumatism" and Arthritis; Review of American and English Literature for 1934, *Ann. Int. Med.* 9: 883 (Jan.) 1936.

Those physicians whose work impinges on industry will be interested in the statement that, in cases of chronic trauma to joints, symptoms may develop so slowly that their connection with the trauma may be overlooked and that well advanced articular lesions may remain symptomless until some unusual strain is experienced. Probably more distinct advances have been made in gonorrheal arthritis than in any other type of the disease. Aiding diagnosis of this condition, a new culture method for identification of *Neisseria gonorrhoeae* has been found more reliable than examination of smears; also, complement fixation methods are of value. In treatment, induction of fever (fever therapy) seems to be most satisfactory, both for the infection itself and for the joints.

General medical readers and sanitarians will be glad to know that the incidence of tuberculous arthritis is declining, partly because of certification of herds and pasteurization of milk. Trauma may be an inciting or precipitating factor of this disease, and roentgenograms do not give incontrovertible evidence in diagnosis. The most conservative treatment, all things considered, may be surgical operation in a great many cases. Tuberculous arthritis must not be confused with tuberculous rheumatism. The latter condition, if it exists at all, is thought to be attributable to a tuberculous toxin from some distant focus, a filtrable virus, an attenuated form of the bacilli of tuberculosis, or an allergic reaction.

In differential diagnosis it is necessary to avoid confusing rheumatic fever with the arthralgia of undulant fever and Haverhill fever or with erythema arthriticum epidemicum. Further evidence is recounted that rheumatic fever and rheumatic heart disease are influenced by environment; namely, that the incidence is low and the disease relatively mild in the tropics, that the incidence is higher in the temperate zones and among persons living near sea level or in basements and also that the incidence is higher in cold, damp months. This last observation doubtless will confirm the personal impression of many physicians.

According to the committee the two principal forms of chronic arthritis are (1) atrophic arthritis, which is to be considered synonymous with chronic infectious, proliferative, type one, synovial and rheumatoid arthritis, and (2) hypertrophic arthritis, synonymous with chronic senescent, degenerative, type two, chondro-osseous arthritis or osteo-arthritis. Substantially nothing has been added recently to knowledge of etiology or treatment of either disease. The only advance has been in tolerance of most writers for the views of others; this open-mindedness, in a field in which nobody knows much, is a necessary prerequisite to acquirement of knowledge.

From the frequent frank comments that the authors have inserted throughout their review, it is evident that the 400 articles read in a review of the literature for a single year was a far greater number than was justified by what most of the articles contained.

## THE ULTIMATE RESULTS OF OPERATIONS FOR INTRACRANIAL TUMORS

At Yale University School of Medicine, New Haven, there is now a collection of more than 2,000 brain tumors, together with microscopic preparations and clinical and follow-up records of the cases. This unique collection of specimens and records is a result of many years of surgical work and research carried on by Dr. Harvey Cushing at the Peter Bent Brigham Hospital in Boston. Recently about 50,000 pages of records that deal with these tumors were made by means of the Leica camera and cinema-film methods, and transferred to New Haven, with the permission of the Peter Bent Brigham Hospital Board. Thus there is available for study at Yale not only these tumors and their histologic preparations but the clinical records, the subsequent correspondence and the accounts of follow-up examinations of the patients, which continue to be added to the records as the years go by.

A former assistant resident surgeon<sup>1</sup> in Dr. Cushing's clinic recently came from England to study the ultimate results of operations performed during the year of his residency, which ended in September 1927. Three hundred and sixty-nine patients were admitted to the clinic in that year for symptoms suggesting intracranial tumor, and in 157 cases the tumor was verified histologically and classified. Contact has been maintained during subsequent years with the 135 patients who left the hospital alive. The manner of death of the seventy-two patients who have succumbed in the interval is known, and in some cases a necropsy was secured. The 135 patients send to the Brain Tumor Registry in New Haven an annual report of their condition and many of them return periodically for reexamination. This follow-up work continues to be under the direction of Dr. Louise Eisenhardt.

Cairns was especially interested in finding out how many of these patients were able to live useful lives following the operation. Obviously, in some patients irreparable damage had been done by the tumor before the operation was performed. The temperament of the patient and the pathologic type of the tumor also must be taken into consideration to assess the value of the operative treatment. There is fairly general agreement that histologic differences of intracranial tumors have clinical significance.

Among the 157 patients there were fifty-nine operated on who had gliomas; eight of these are still living seven or more years after the operation, and five of them are living useful lives. Dr. Eisenhardt adds the interesting fact that one patient operated on for glioma is still living more than twenty-six years after the operation.

Twenty-nine patients who had pituitary adenomas were operated on during the residency of Cairns; nineteen of these patients are living seven or more years after the operation, and ten of them are living useful

lives. The longest period of postoperative survival of a patient operated on for pituitary adenoma is now more than twenty-four years.

Thirty-one patients had meningioma; of these, eighteen are still living seven or more years after the operation and fourteen are living useful lives. The longest postoperative survival period in this group was more than twenty-five years.

In the group of 157 cases there were small numbers of cases of craniopharyngiomas, cholesteatomas, metastatic tumors and granulomas. Of eight patients with metastatic intracranial tumors operated on, not one was living seven years after the operation. The number of patients surviving seven or more years, however, totaled sixty-three, and thirty-seven of them were living useful lives. In other words, 40.1 per cent of the patients who left the hospital alive during the year of residency were still living after seven or more years, and 58.7 per cent of this group of sixty-three were living useful lives.

The glioblastoma multiforme is one of the most devastating of brain tumors. It grows rapidly in the white matter of the cerebrum and usually contains areas of necrosis and hemorrhage, and at times cysts. This tumor may appear at operation to be sharply defined from the surrounding white matter, but even after apparently complete removal it recurs in most cases. Among the cases studied by Cairns there were eight cases of glioblastoma multiforme and every one of these patients died, the average survival period from the time of operation being about six and a half months.

Another highly unfavorable type of tumor is the cerebellar medulloblastoma, which arises usually in the vermis of children and young adults. The diagnosis is rarely difficult, and at operation the tumor can apparently be shelled out completely. However, usually within a year this tumor recurs. Even then, radiation therapy will ameliorate the symptoms; but, as time goes on, irradiation ceases to give relief and the patient dies. There were five patients having cerebellar medulloblastomas, and all died on the average in thirteen months after operation. In the entire series of seventy cases of this tumor in the Brain Tumor Registry, there was one exceptional case in which the patient was living and well when last heard from seven years after the operation.

A few years ago, the location of the intracranial tumor influenced the longevity almost as much as did its pathologic nature. This is no longer true. Great advances have been made in the treatment of benign tumors of the midbrain and of the third and lateral ventricles. The most inaccessible location of a brain tumor at present, as far as unfavorable prognosis is concerned, and the site therefore of paramount importance, is within the corpus callosum, the basal ganglions, the midbrain, the pons or the medulla.

The chances of a useful survival for a period of seven to nine years for patients with verified intra-

1. Cairns, Hugh. The Ultimate Results of Operations for Intracranial Tumors, *Yale J Biol & Med* 8: 421 (Mar) 1936

cranial tumors who were operated on in this clinic in the year that ended in September 1927 were roughly one in four. These results are so good, Cairns said, that it is reasonably certain they do not represent the average of achievements in intracranial surgery in the world at large during that period. The ultimate results were influenced by the excellent clinic organization and by the judgment, experience and technical skill of the operating surgeon. There was little or no deliberate selection of cases for operation within the clinic, and the number of patients discharged from the hospital alive as cases of inoperable tumor was extremely small.

Van Wagenen,<sup>2</sup> another of Dr. Cushing's former resident physicians, made a similar study of patients operated on in 1924-1925. As time goes on, no doubt, studies will be made by others especially interested in the ultimate results of operations for intracranial tumors.

### DIET AND CANCER

Since the publication, more than twenty-five years ago, of Moreschi's<sup>1</sup> study of the effects of underfeeding in modifying the growth of tumor transplants in mice, many investigators have attempted to determine the possibilities. Even today, however, we continue to ask whether low calory intake can be relied on to delay growth of tumors, postpone the inevitable fatal end to which such growths lead, or retard or hinder the onset of malignant neoplasms that arise spontaneously. Many studies have been inconclusive because "controls" have been fed a diet without relation to that given to the experimental animals with which they have been compared. Indeed, the chief difficulties encountered in interpreting published results of researches on the relation of diet to cancer have been that more than one variable has been studied at a time. This error is illustrated by the common practice of restricting total food intake without making provision to avoid the resulting reduction to an inadequate level of such dietary essentials as, for instance, protein and mineral salts. By such oversight, obviously, there is imposed on experimental animals not only an insufficiency of food calories but also a restriction to a quantity of essential dietary constituents much less than that enjoyed by their controls. Moreover, genetic factors known to favor or limit takes of transplants often have been disregarded.

Besides underfeeding, many other phases of the possible modifying effects of diet on cancer have been investigated. Included among foods the effects of which on cancer have been studied are milk, bananas, tomatoes, liver, animal tissues, proteins, fats, carbohydrates, mineral salts and vitamins. Though the dietary field explored has been extensive, results

reported are chiefly unconvincing, owing in large part to such experimental irregularities as have been mentioned. In only a few instances have so-called synthetic diets been employed alike for control and for experimental animals, thus making it possible to study only one known factor at a time, which alone would make the difference between the diet given to controls and that supplied to their experimental mates.

The response of a host to growing tumor tissue that has arisen spontaneously is conceded to be different from that of an immune animal toward transplanted neoplasms. There is a distinct advantage then to cancer research and thus to the human cancer problem in the use of experimental animals with a high incidence of malignant tumors spontaneous in origin. The possibility that diet may have a beneficial influence in cancer is still unanswered. Dietary factors are worthy of investigation. They should be studied with the exacting technic used in modern nutritional investigations, employing animals of known genetic history, with a high susceptibility to spontaneous development of malignant tumors.

### Current Comment

#### THE EMASCULATED NEW FOOD AND DRUG BILL

Elsewhere in this issue we print an analysis<sup>1</sup> of the emasculated new pure food and drug bill which, it was contemplated many long months ago, would make good the deficiencies of the food and drug legislation of the first Rooseveltian era. The last thirty years has seen the rise of modern advertising methods that completely nullify the protection accorded the consumer by honesty on the label and package. Thus a modern bill must control advertising by mail, by billboards, in newspapers and magazines, and particularly over the radio. The bill first introduced has been subjected to a sort of plastic surgery in the legislative operating rooms which has resulted in a specimen not even resembling the original model and utterly deficient in many particulars. Altogether the result is an asthenic, chinless and impotent monstrosity. Formulas under this bill are secret and filed with the Department of Agriculture. Violations must be carried from the department into the Federal Trade Commission and the procedure is so long and wearisome and the penalties are so inadequate that the forces of quackdom may ravage the sick and ailing and retire with their booty long before the processes of investigation and prosecution catch up with them. This bill, so far from the ideal, might much better be scrapped and a new beginning be made when a more favorable opportunity offers. Perhaps the best procedure would still be to amend and strengthen the original pure food and drug legislation by taking account of the need for control over advertising, the great development of the cosmetic industry, and the newer social point of view which demands adequate protection of the uninformed consumer.

(Continued from page 1823)

### HOUSE OF DELEGATES

#### Second Meeting—Tuesday Morning, May 12

The House of Delegates was called to order at 9:45 a. m. by the Speaker, Dr. Nathan B. Van Etten.

#### Roll Call and Presentation of Minutes

The Secretary stated that more than a quorum was present. It was moved by Dr. Arthur J. Bedell, New York, seconded by Dr. Arthur C. Morgan, Pennsylvania, and carried, that the House dispense with the roll call and with the reading of the minutes.

#### Report of the Reference Committee on Credentials

Dr. J. D. Brook, Chairman, reported that thirteen delegates had been registered since the previous report of the Committee, making a total registration of 166.

The Speaker announced that the report would be received.

#### Report of Board of Trustees

Dr. Rock Sleyster, Chairman, presented the following report:

The Board of Trustees has considered the resolution concerning the scientific status of methods and the development of progress in air conditioning, introduced into the House of Delegates yesterday by Dr. Arthur J. Bedell, New York. It believes this matter is one worthy of investigation and will see that a committee is appointed for this purpose.

Dr. Arthur J. Bedell, New York, moved that the report be accepted. The motion was seconded by Dr. H. B. Everett, Tennessee, and carried.

#### Supplementary Report of Judicial Council

Dr. George Edward Follansbee, Chairman, presented the following supplementary report of the Judicial Council, which was referred to the Reference Committee on Reports of Officers:

During the past year sudden death has invaded the membership of the Judicial Council. On Sept. 13, 1935, Dr. Edwin P. Sloan of Illinois died of myocarditis. On Dec. 27, 1935, Dr. Emmett P. North of Missouri died of cerebral hemorrhage. Dr. Sloan was made a member of the Council in 1932 and Dr. North in 1934. Both of these men were valuable members of the Council, judicially minded, fair and interested in their duties. Dr. Lloyd Noland of Alabama was appointed by the President to fill the vacancy caused by the death of Dr. Edwin P. Sloan. The vacancy caused by the death of Dr. Emmett P. North has not been filled as yet.

There are at present several members of this Association who are either serving sentence for felonies or have recently terminated such sentence. Their names are carried as members in the American Medical Directory. This condition is brought about by county societies and state associations neglecting or refusing to expel such felons. The Judicial Council believes that the continuance of such men in membership, and the publication of their names as members in the American Medical Directory, are beneath the dignity of this Association and open the door to harmful criticism of the organized profession. The Council at the proper time will offer a suggested amendment to the Constitution to relieve the present situation.

The report of the Judicial Council to the House of Delegates last year said in part "It might be advisable to extend the origination of charges in some situations manifestly too great for the county society to handle to the state association and

possibly, in rare instances, to the national organization. There rarely would be infractions of such magnitude that the national association and seldom that the state association should be the originator of any action toward discipline. If and when the House of Delegates sees fit to extend original jurisdiction in matters of discipline to the national organization, the Judicial Council suggests that it should have the duties and powers now conferred on it, but it should not at any time be placed in an ex parte position. In those instances of abuse of such nature or such magnitude as to warrant national rather than state or county institution of proceedings, there should be some other body, either now in existence or created, to act as grand jury to investigate and, if deemed proper, prepare an indictment against the accused. In case of indictment, the Board of Trustees should assign the prosecution to some one of their choice and the case should be tried before the Judicial Council, which under such procedure would not be under suspicion of prejudice."

On recommendation of the reference committee to which the report was referred the Council was directed to "submit amendments to the Constitution and By-Laws of the Association as are necessary to secure the purposes sought." The Council has found such revision comparatively simple and will submit such amendments at the proper time.

At the last meeting of the House of Delegates at the last annual session of the Association, resolutions opposing acceptance of commissions and limiting the use of audiometers, presented by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, were referred to the Judicial Council with directions to prepare and present to the profession an interpretation meeting objections which were raised during discussion of the resolutions on the floor of the House.

Members of the Section on Laryngology, Otology and Rhinology in cooperation with the Judicial Council have drawn up a resolution which it is believed will meet general approval and will be presented to the House at a suitable time.

Respectfully submitted.

GEORGE EDWARD FOLLANSBEE, Chairman.

WALTER F. DONALDSON.

LOYD NOLAND.

JOHN H. O'SHEA.

#### Report of Judicial Council on Interpretation of Constitution and By-Laws

Dr. George Edward Follansbee, Chairman, asked Dr. John H. O'Shea, member of the Council, to present this report of the Judicial Council. Dr. O'Shea presented the following report:

The present situation is covered by Article 6, Section 2, of the Constitution, which provides that "These officers (general officers) shall be elected annually and, except the Trustees, shall serve for one year or until their successors are elected and installed"; and by Chapter IV, Section 8, of the By-Laws, which reads "The President shall be installed at the opening general meeting of the Scientific Assembly of the annual session following that at which he was elected." The language of the Constitution and By-Laws is mandatory, and no other sections apply.

Each member of the Judicial Council has profound sympathy with our President-Elect in his most unfortunate catastrophe and with his family and friends. It would be happy to find some way which would be practical and legal to advance the President-Elect to the Presidency at this time but it must admit failure under the present Constitution and By-Laws. It cannot

recommend to the House of Delegates any procedure which would evade or nullify the Constitution and By-Laws.

The Council, therefore, recommends that no action be taken by the House of Delegates and that the present President continue in office as provided in Article 6, Section 2, of the Constitution.

Dr. B. F. Bailey, Nebraska, moved that the recommendation of the Judicial Council be approved and adopted, and the motion was seconded by Dr. A. A. Walker, Alabama.

Dr. W. H. Seemann, Louisiana, offered as a substitute a motion to the effect that Dr. J. Tate Mason be installed as President at the Opening General Meeting on Tuesday, May 12, but accepted a suggestion offered by Dr. E. M. Palette, which was incorporated into the substitute motion, to the effect that Dr. J. Tate Mason be installed as President at the Opening General Meeting on Tuesday, May 12, in a manner prescribed by the Judicial Council. The substitute motion was seconded and carried.

#### Report of Reference Committee on Medical Education

Dr. George Blumer, Chairman, presented the following report:

##### REPORT OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

1. Your committee approves the general principle that physicians on the staffs of hospitals approved for intern training should be limited to members in good standing of their local county medical societies.
2. Your committee commends the activities of the Council on Medical Education and Hospitals in its attempt to improve the methods of administering the Principles of Medical Ethics in connection with the Judicial Council as discussed in paragraph 2 of its report.
3. Your committee wishes to emphasize the importance of the teaching of medical economics in medical schools and would also stress the necessity of deans of medical faculties developing in their teaching staff individuals especially competent for this purpose.
4. Your committee commends the activities of the Council in its survey of medical schools and bespeaks its continuance. The committee recognizes the magnitude of the task involved in the inspection of hospitals and urges continuance.
5. Your committee commends the plans for the study of graduate training of physicians in its various phases and regards graduate training as one of the most pressing problems facing the medical profession at the present time.
6. Your committee also commends the attention which the Council has given to the question of intern training and endorses the recommendations of the Council in this matter.

##### RESOLUTION ON ENTRANCE REQUIREMENTS TO MEDICAL COURSES OF EDUCATIONAL INSTITUTIONS

Your committee recommends the adoption of this resolution, realizing that the subject will require a great deal of additional study in order to arrive at satisfactory methods of administration.

##### SUPPLEMENTS TO THE REPORT OF THE COUNCIL ON MEDICAL EDUCATION ON SCHOOLS FOR LABORATORY TECHNICIANS AND FOR PHYSICAL THERAPY TECHNICIANS

Appreciating the necessity for the better training of technicians, your committee recommends to the Council continued consideration of the problem, believing that at all times the services of such medical helpers should be under the supervision and absolute control of the medical profession.

##### RESOLUTIONS REGARDING THE PRACTICE OF RADIOLOGY AND ITS DIVISION INTO PROFESSIONAL AND TECHNICAL SERVICES AND THE RESOLUTION REGARDING OTHER TECHNICAL AND PROFESSIONAL SERVICES

Your committee submits the following recommendations:

1. It reiterates the principle enunciated by the House of Delegates at Cleveland in 1934 "That the practice of radiology, whether for diagnostic or therapeutic purposes, constitutes in fact the practice of medicine." The action of the House of

Delegates in 1925 establishing a section on radiology confirms this principle.

2. It further recommends that all services connected with the practice of radiology be under the direct control and supervision of the medical profession, and this same principle pertains to other technical and professional services.

Respectfully submitted,

J. F. SILER.

J. GURNEY TAYLOR.

GEORGE BLUMER, Chairman.

C. A. DUKES.

BEN R. MCCLELLAN.

On motions of Dr. Blumer, duly seconded and carried, the report was adopted section by section and as a whole, after discussion by members of the House.

#### Report of Reference Committee on Sections and Section Work

Dr. Arthur J. Bedell, Chairman, presented the following report:

*Mr. Speaker and Members of the House of Delegates:*

Your Reference Committee on Sections and Section Work has carefully read the published report of the Council on Scientific Assembly and heartily concurs in all the statements but is persuaded that the time has come to go into more detail concerning the volume of work done by this Council in the preparation of the annual programs. The activities of the Council constitute one of the most important functions of our organization. The published report of this Council in the Handbook is of necessity short and does not in any wise disclose the voluminous correspondence or reflect the keen sense of discretion exercised in the building of our scientific programs. An analysis, for instance, reveals that thirteen distinguished physicians will present papers in the general scientific meetings to be held Monday and Tuesday, May 11 and 12. This innovation of the past few years has proved of immense interest, as evidenced by the increasing attendance from year to year and the careful attention given by the listeners.

The section meetings have followed the usual plan and are so well staggered that those doing work in allied specialties can attend both morning and afternoon meetings. The program in its totality constitutes the most enlightening, comprehensive and desirable week of postgraduate instruction available to medical men anywhere in the world. Your committee, therefore, feels that the attention of our members should be drawn to the excellence of this week of medical education and that the constituent state associations should urge a larger percentage of their members to avail themselves of the privilege of attendance on the annual sessions.

The scientific exhibits make up one of the most interesting and instructive features of the annual programs. This year 170 scientific exhibits will be presented, affording a wealth of easily available information and susceptible of review within a brief space of time. This feature, taken with the scientific programs of the various sections, constitutes a combination which, for its appeal and scientific value, cannot be rivaled by any medical body at home or abroad. Your committee recommends that this type of program be continued.

The Council on Scientific Assembly presented a supplementary report bearing on the relation of blood grouping to paternity in which it stated that it had looked "into the question of blood grouping in establishing the paternity of a child, and it wishes to report at the present time that from its knowledge of this subject and a careful study of the literature it is not possible to state with any degree of certainty that the child is an offspring of a certain adult or that the latter is the father or mother of the child."

Your committee desires to commend the Council for its painstaking work and scientific approach to the answer sought and recommends that the matter be referred to the Board of Trustees for such further action as the wisdom of that body may dictate.

Your committee considered the following resolution presented by Dr. Albert Soiland, Section on Radiology, and adopted by the Section on Radiology at the 1935 meeting, as follows:

WHEREAS, The answers published in the Department of Queries and Minor Notes of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, being unsigned, are readily construed as representing the official opinion

of the American Medical Association, thus giving them a standing and authority which would otherwise not obtain; and

WHEREAS, The answers are obviously on occasion merely the expression of individual opinion and should be interpreted in the light of that fact; and

WHEREAS, Without such interpretation the answers are misleading and deceptive and capable of working a serious injustice to many who may hold opinions at variance with those expressed; therefore be it

Resolved, That the Section on Radiology of the American Medical Association recommends to the House of Delegates that appropriate steps be taken to make plain to the casual readers of THE JOURNAL the status of and responsibility for the answers published in the Department of Queries and Minor Notes.

Your committee is reliably informed that the Department of Queries and Minor Notes of THE JOURNAL is one of the most popular features of our official organ, eagerly consulted by the rank and file of our membership. Your committee is further informed that the answers to questions appearing in this section of THE JOURNAL are furnished by a group of outstanding men selected because of their familiarity with the particular problems raised by the questioner. Notwithstanding, your committee, after consultation with the Editor of THE JOURNAL, recommends that in the future there be inscribed at the head of this section of THE JOURNAL a statement setting forth that the answers given to the queries, although believed to be scientifically accurate, do not represent the consensus of opinion of any official body of the Association, unless so stated in the answer.

In closing this report, your committee, prompted by a desire to make possible a contribution to future programs, offers the following suggestion:

In spite of the implication in Section 13, Chapter XIV, of the Constitution and By-Laws, which reads as follows, "A Fellow shall present no more than one paper at any Scientific Assembly," a perusal of the program reveals occasional instances of repetition in the designation of one man to lead in the discussion of papers. Your committee believes this to be a violation of the spirit of the above section, which was evidently intended to enable the Council on Scientific Assembly to give the largest possible number of our members opportunity for appearance on the program. Your committee recommends that this section of the By-Laws be amended so as to preclude a continuance of this practice.

Finally, your committee desires to commend the Council on Scientific Assembly for having brought to this annual meeting the following distinguished foreign guests to address us: Lord Horder, London, England; Leon Asher, Bern, Switzerland, and Wolfgang Heubner, Berlin, Germany.

It is through the interchange of distinguished speakers with organized medical groups in our own and other countries that our membership is kept abreast of the development of world-wide medicine and is stimulated to renewed devotion to the traditional ideals of our profession. Your committee hopes to see this practice continued.

Respectfully submitted.

ARTHUR J. BEDELL, Chairman.  
CLYDE L. CUMMER.  
TOM B. THROCKMORTON.  
J. F. HASSIG.  
C. W. ROBERTS.

On motions of Dr. Bedell, duly seconded and carried, the report was adopted section by section and as a whole with the exception of that part which was referred to the Reference Committee on Amendments to the Constitution and By-Laws.

#### Report of Reference Committee on Reports of Officers

Dr. E. H. Cary, Chairman, presented the following report:

Your Reference Committee on Reports of Officers finds it a pleasure to review the observations of the officers and of the Judicial Council.

The President brings forcibly to our attention the political implications of social reforms, particularly as they affect the practice of medicine. Undoubtedly, the medical profession has been able as a united force to cause the American people to stop and consider any change affecting the practice of medicine. He calls your attention to the insidious invasion of private practice in the wake of so-called social reforms abroad and warns against the legislators' tendencies to exploit the needs of humanity.

He recognizes the fact that the members of this organization should be ever alert to continue to know the needs of the sick and aggressively meet our responsibility.

The observation of the President after two years of service is naturally of interest. Your committee notes his recognition of the cohesiveness of the medical profession and its loyalty to the American Medical Association. He raises many points of interest which will find a solution through education of both the medical profession and the public.

Not the least of the hazards attendant on new proposals for medical care may be those hastily arranged as temporary measures and submitted by the medical profession itself.

Undoubtedly the future of American medicine will depend on the type of men who are admitted to our medical schools. Safeguards of every kind should be utilized to protect medicine so that the untiring student shall also be deeply interested in his relationship to the members of his profession and the people.

Referring to the President's query about standardizing relationship of organized medicine and governmental agencies: Your committee would like to suggest that this question is pertinent at this time, owing to the provisions of the Social Security Act. While there is no disposition on the part of governmental agencies, medically supervised, to be arbitrary, it is of paramount interest to the medical profession to understand the implications involving the future practice of medicine. This requires immediate study on the part of constituent state associations who can intelligently act with the authorized agencies, particularly the state public health officer.

Your committee concurs with the beautiful sentiment about the President-Elect, Dr. J. Tate Mason, which our worthy President has expressed in the last paragraph of his address.

Referring to the address of the President-Elect, read by Dr. Brien T. King, Washington, it is of interest to note Dr. Mason's discovery that, although the economic situation was of supreme importance at every gathering of medical men, it was more surprising to find out how little the average physician knows of the operation of American Medical Association headquarters. Your committee earnestly recommends that the constituent state associations endeavor to familiarize their membership with these operations, whether this be by personal contacts, the printed word or the American Medical Association motion picture.

Your committee notes his analysis of medical thoughts on economic ills but feels that the unanimous opinion of this body has been adequately formulated at recent sessions. Attention has been wisely called to the advisability of deliberate consideration in these matters, adhering to tested principles which have been found most essential to the welfare of the physician and the patient.

It is a matter of sincere regret to the members of this committee and to the House of Delegates that illness has deprived Dr. Mason of the pleasure of attending this meeting, at which he was to assume the highest honor within the gift of the organization. Your committee sincerely hopes that he will soon recover and that the Association will again be blessed with his presence and his leadership.

Referring to the address of the Speaker, your committee welcomes the Speaker's charge to the members of this body. He emphasizes the importance of the duties of a delegate, his obligation to the American Medical Association and to the society which he represents. He also develops the need for deliberation on all matters presented. There is assurance of recognition so that democratic deliberation shall prevail. The encouragement given new members of this body to participate is particularly pleasing. Your committee endorses his comments on the part which the individual physician should play in civic affairs. The medical man who actively engages in the public life of his community not only serves the public well but advances the aims of organized medicine in an equally satisfactory manner.

The instructions to the delegates relative to the modus operandi of the House of Delegates are appreciated. Your committee approves in the interests of efficiency the appointment of a special committee for the executive session.

With respect to the address of the Vice President, your committee commends his recommendation that the members of the American Medical Association refer often to the early history

of the Association as recorded in the minutes of its formative period and is in accord with his observations that the founders of the Association were men of far seeing vision and that the spectacular development of the Association has been due, in large measure, to their wisdom in meeting many of the problems of their day—not so very different from some of the problems before the profession at the present time.

Relative to the Report of the Judicial Council, your committee notes that the recommendation of the Judicial Council at the last annual session suggesting a closer alliance between the Judicial Council and the Council on Medical Education and Hospitals has been complied with and that satisfaction has resulted from this cooperation.

Your committee approves the stand of the Council on the question of the right of osteopaths to admit patients to institutions in certain states and suggests that more aggressive action is demanded of the medical professions of those states lest the standards of medical practice be lowered.

While the patent situation is still unsatisfactory, your committee is pleased to note that this is the subject of continued study.

The importance of following established procedures in trials is properly reemphasized. Your committee thoroughly approves the recommendation that component societies take notice of this section of the report.

Your committee considers that the invasion by hospitals of the field of the practice of medicine should be condemned as a violation of the fundamental rights of physicians and that it demands militant opposition to the end that such activities cease.

Your committee scarcely feels it necessary to state its hearty endorsement of the Judicial Council's disapproval of all relationship between organized medicine and irregular practitioners and would like to call attention specifically to the second paragraph on page 147 of the Handbook and ask that the optometrists be included among irregular practitioners.

Respectfully submitted. E. H. CARY, Chairman.  
WILLIAM R. BROOKSHER. EDGAR A. HINES.  
WILLIAM A. ELLINGWOOD. EDWARD R. CUNIFFE.

On motions of Dr. Cary, duly seconded and carried, the report was adopted section by section and as a whole.

#### Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. Frederic E. Sondern, Chairman, presented a partial report of the Reference Committee on Reports of Board of Trustees and Secretary. The complete report, together with the action thereon, will be found in the report of the reference committee at the Tuesday afternoon meeting of the House of Delegates.

#### Report of Reference Committee on Miscellaneous Business

Dr. H. A. Luce, Chairman, presented the following report:

Your committee has carefully considered the resolutions referred to it.

The resolution approved by the council of the Oregon State Medical Society and submitted by Dr. John H. Fitzgibbon, Oregon, is unanimously approved by your reference committee, and the reference committee further recommends that this action be transmitted to the Federal Radio Commission.

Your committee is in sympathy with the spirit and purpose of the resolutions introduced from the Arkansas Medical Society. Certain judicial interpretations of the ethical principles involved, however, lead your committee to believe that it would be a mistake to endorse these resolutions until such time as the Judicial Council can report on the matter. Your committee recommends that these resolutions be referred to the Judicial Council for report at its earliest convenience.

Your reference committee requests the privilege of reporting on the resolution, approved by the house of delegates of the Medical Society of the State of New York, relative to prevention of asphyxial death, at the Executive Session.

Respectively submitted. HENRY A. LUCE, Chairman.  
A. J. SCOTT. G. HENRY MUNDT.  
H. B. EVERETT. HARVEY B. STONE.

The report of the reference committee was adopted section by section and as a whole on motions of Dr. Luce, seconded and carried.

#### Report of Reference Committee on Legislation and Public Relations

Dr. R. L. Sensenich, Chairman, presented several sections of the report of the Reference Committee on Legislation and Public Relations. The entire report may be found in the report of the reference committee at the Tuesday afternoon meeting of the House.

#### Address of Lord Horder

Lord Horder of England was escorted to the platform and introduced by the Speaker. He addressed the House as follows:

*Mr. President, Mr. Speaker, and Gentlemen, Delegates:*

I don't propose to interrupt your business for more than a few minutes. I am impressed by the compliment you have paid me, Mr. President and Mr. Speaker, of being asked to come here at all, because I realize that I am under very strict surveillance in this room—I was led by arm to the rostrum and I have no doubt I will be led back. I understand that my guide and friend was a Colonel during the war. I reminded him that there was not at the moment a war on, and, therefore, we were free citizens.

I have a message from the sister society, my own British Medical Association, and it was thought by your President that this evening might be rather a crowded occasion and not perhaps so fit as this to read you this message of greeting. It is in effect a personal letter from Dr. Anderson, our Medical Secretary, to myself.

Dear Lord Horder:

The Council at its meeting on the 8th of April had before it an invitation from the American Medical Association to appoint a delegate to the annual convention of that body to be held in Kansas City, from May 11 to 15, 1936, and I was requested to ask if you would honor the Association by acting in this capacity.

There is no specific function attaching to the appointment, but the Council would be grateful if you would take a suitable opportunity during the proceedings of the meeting to convey its greetings to the American Medical Association, its cordial good wishes for the continued success and prosperity of that body, and its appreciation of the many acts of kindness extended in the past to members of the British Medical Association, particularly on the occasion of the visit of the party which crossed America en route to the Annual Meeting of the British Medical Association in Melbourne, Australia, in September 1935.

Yours sincerely,

G. C. ANDERSON.

As a matter of fact, Mr. President, before I am conducted from this hall, might I add a few personal words? I will be extremely careful and tactful. These are just a few impressions that I have made and they have not been abetted by any one, so I regard this trust and confidence as being again a great compliment.

I think of the things I might say, gentlemen, but from my experience during the past three weeks, I find it safer not to say. But I want quite frankly to tell you, if you will credit me with being observant, that I am very greatly impressed by this gathering and the function that I know it serves, as I was in New York when I was paid a similar compliment and asked to attend one of the meetings of the house of delegates in the Medical Society of the State of New York. You see why I am so interested, not to say thrilled, is that we have no parliament within our profession as you have. That perhaps has some advantages; I am quite sure it has great disadvantages. I am one of those who hold that a profession can discipline and govern itself very much better than it can be either disciplined or governed from outside. In my country the legal profession does discipline and govern itself as you do in medicine here. We are both disciplined and educated, I may say, and governed by a statutory body, which although it has considerable medical representation is not per se a medical body at all but a legal body; it is what we call a committee of the Privy Council.

So that although we have a court of conduct here and there, the College of Physicians, the College of Surgeons, they are in effect courts of conduct, but they have no power. The power, following on any view that we may take in our col-

leges, on some ethical point, is entirely outside our own profession.

You have a great advantage, if I may say so, but then it is obvious, it only needs saying rather than emphasizing, all the more care surely must be exercised that you give it public confidence. I won't say that our statutory body, the General Medical Council, gives the public very much confidence, but when the public loses confidence, at most it loses confidence in a quasipolitical body and not in our profession.

You have quite clearly to be rigidly representative, you have to get all the wisdom available, and I have noted with some interest the great amount of time and care and devotion given by what I may call perhaps without the slightest offense but rather as a tribute the elder statesmen in the medical profession over here, with, as I see, yes I see a sprinkling of those who are still in their salad days.

I don't want to digress, and I told you I wouldn't take your time, but the public doesn't distinguish as we must distinguish between the opportunism of the politician and the permanent, basic, deep principles that underlie our work. Now, it is a rather delicate thing to suggest that at home, although our politicians are opportunists, as every politician is, still our system is perhaps a little more closely allied to mass public opinion, and there is a very great tendency before any radical change is made in matters medical in Great Britain, there is increasing tendency to submit any moot point to bodies which are really in effect medical.

It is true that at the head of the Ministry of Health there is a politician, but after all the man with power in the Ministry of Health is the chief medical officer, and the association and the colleges have considerable power, and I can't conceive any measure of a medicopolitical kind going through our houses of parliament that had not been submitted to all those bodies for criticism. I don't think it would get support if it had not gone to those bodies. But my point, you see, is, as I said, that it would never do to have our system of education, our code of ethics, follow the ebb and flow, or is it an ebb and flow so much as a hectic change that we see in politics, so there must be some big basic principle which is carried on by such a body as yours.

The curriculum I have not had time to go into. Our General Medical Council supervises the curriculum and supervises the examination. We do, of course, the teaching, and we do the examining, but the standard is maintained by the General Medical Council, and that makes it again a lessening of our responsibility, and *per contra* it increases yours, because I suppose that you are responsible for the standard of teaching and the standard of examination which puts a man on the registry.

I think that is all I have to say, because it is quite clear to me your problems are not as simple as ours; your problems inside the profession, of course your problems outside the profession, are so vastly complex that it would be very unwise to say anything except those rather fundamental points that I have touched on.

I think forbearance is my best contribution after what I have said, Mr. President, and I want to thank you once more. Many of you have become, I feel, friends, and to thank you seems almost unnecessary.

#### Remarks of President James S. McLester

Lord Horder, you have honored us greatly by journeying to America to attend this meeting, and we have enjoyed very much having you here. Not only have you added to our pleasure, but you have contributed very much to the intellectuality of our body.

As expressing what we in America think of you of the great British commonwealth of nations, I want to tell you a little personal incident. Immediately after the Great War, I was in the Canal Zone inspecting the fortifications there, and as I had seen the fortifications both on the Pacific and on the Atlantic side I commented to my friend on the fact that the Pacific side was so much better fortified than the Atlantic side, and asked him why. "Well," he said, "eventually we will have the Atlantic side equally well fortified, but you must remember on the Atlantic side we always have the British."

#### Address of Dr. T. C. Routley

The Speaker presented Dr. T. C. Routley, who addressed the House as follows:

*Mr. Speaker, Mr. President, Ladies and Gentlemen:*

I am conscious of the fact that the warmth and cordiality of your welcome is not directed to me solely but through me to the sister society which lies to the north of you.

It has been my very good fortune to have attended your meetings now for a period of thirteen years. I don't know how many years one has to cover a road before he owns it. In our country, if you go across a path for twenty-one years and it has never been barricaded, it is then called common property, so perhaps if you allow me to come for eight more years, I may then be qualified to be a member of your Association.

There are two or three observations which perhaps you will permit me to make. In the first place, I would like to be personal for a moment if I may and say through you to your officers, particularly to my colleague Dr. Olin West, how deeply we in Canada appreciate the services rendered to us at any and all times. Because of your great size and your great development, you have facilities in your organization which of course we in Canada have not, but whenever it is my duty to find out something or to help somebody and we haven't that information in Canada, a word to Olin West brings a reply, and I do want to thank him for that.

The association which I represent desires me to say to you how deeply we appreciated your hospitality last year. Of course we were lost numerically in that great gathering in Atlantic City, but I will assure you that as far as we were concerned ourselves we didn't feel lost, we had a marvelously fine time, it was a great opportunity for us, and we do thank you, Mr. Speaker, Mr. President, and House of Delegates, and the great association which you represent, for the privilege of having that joint meeting.

We in turn feel that it would be a great honor indeed to us if at some early future date you would come back to us. Now, there may be great difficulties in the way of your doing that. On those points, of course, I have nothing to say, and they will be problems which you yourselves will deal with as you see fit. However, if those difficulties can be surmounted, we in Canada having canvassed the situation have determined that if you can come we would like you to come and meet with us in the city of Toronto. I am sure many of you know it; it is a city of 700,000 people, and we feel that it has adequate facilities for convention purposes, and I was instructed to bring to you not only an invitation from the Canadian Medical Association but from the provincial association in the province of Ontario and from the local medical society, the Academy of Medicine of Toronto, a society with 900 fellows.

We believe that we could give you a good time and that you in turn would bring much to us. We hear many things these days about unrest in the world, about national and international problems. What group is there in the world to whom man may look with more hope of success than asking the medical profession to give leadership to the world problems? Who is there that enjoys the confidence of his fellow man so much as the doctor? So it seems to me, Mr. Speaker, that the more and more we in medicine find it possible to get together nationally, internationally, yes, and in a world-wide fashion, if that were possible, the more we shall lighten the load, and by that we can hope that those intercourses will do a great deal to bring the world from chaos to cosmos and to give common people a chance to believe that the world is not going to the dogs.

I do not wish to take up further of your time, but in sitting down again perhaps you will let me say how deeply we in Canada appreciate your friendship, not only medically but nationally and in every other way, and we trust that in the not far distant future you will give us the great joy of entertaining you within our own shores.

#### Remarks of President James S. McLester

Dr. Routley, we too deeply appreciate your friendship. You and your colleagues made the Atlantic City meeting for us, and we shall always remember it with a great deal of pleasure.

**Message to Dr. J. Tate Mason**

It was moved by Dr. A. A. Ross, Texas, seconded by Dr. J. W. Burns, Texas, and carried, that the Secretary send to Dr. J. Tate Mason a message of the affectionate regard of American medicine and convey to him information of what has been done, extending to him the sympathetic consideration of the House for his condition.

The House recessed at 12:25 p. m., to reconvene at 1:15.

**Tuesday Afternoon, May 12**

The House of Delegates was called to order at 1:40 p. m. by the Speaker, Dr. N. B. Van Etten.

**Report of the Reference Committee on Legislation and Public Relations**

Dr. R. L. Sensenich, Chairman, presented the remainder of the report of the Committee. The report, including those sections that were presented Tuesday morning, follows:

Your Reference Committee on Legislation and Public Relations submits the following report:

That portion of the report of the Board of Trustees giving account of the activities of the Bureau of Legal Medicine and Legislation and the Bureau of Medical Economics was referred to this committee.

The report is printed in the Handbook and as it comprises thirty-three pages it is not practical to reread the report before the House. Attention will, however, be directed by page and paragraph subheading, as the report of your committee is read.

**REPORT OF BUREAU OF LEGAL MEDICINE AND LEGISLATION**

Page 66 of the Handbook, "Social Security Act": Your reference committee calls attention especially to the suggestion that the medical profession cooperate in good faith in carrying out the provisions of this act. Your committee, however, wishes to emphasize the fact that the basic requirements of federal legislation are so broad as to permit the creation within the state social legislative structure of conditions which may be very difficult of administration in a manner acceptable to physicians if the local profession does not participate in the organization of the state structure.

Page 66 of the Handbook, "Food, Drugs, Devices and Cosmetics Legislation": The committee commends the Bureau of Legal Medicine and Legislation for its activity in the interest of an effective food and drug act and wishes to point out to the members of the House of Delegates and to the constituent associations that if and when a satisfactory bill is presented to the Congress, the medical profession should exert every effort to secure its enactment.

Pages 67 and 68 of the Handbook, "Medical and Hospital Care for Employees on Emergency Relief Rolls": Reference is made to failure to provide medical and hospital service for those receiving insufficient wages to pay for such service, when employed in the Works Progress Administration. A similar situation is reported to have arisen in connection with the activities of the Rural Resettlement Administration. Your committee wishes to point out that while in many states emergency relief officers and supervisors of the poor have declined to assume responsibility for medical relief to individuals so employed, there has recently been a tendency to relax this restriction and recognize the responsibility to provide medical service at public expense for those not receiving a sufficient government wage to provide for themselves.

Pages 68 and 69 of the Handbook, "Veterans' Legislation": Your committee wishes to direct attention especially to the report that no legislation is being pressed for by the Veterans' Bureau or American Legion proposing the enlargement of the privileges of veterans with respect to medical care and hospitalization.

Page 69 of the Handbook, "Reserve Officers' Training Corps": Your committee wishes to add that since the report of the Bureau of Legal Medicine and Legislation was written the Congress has approved bill 1937 and the continuance of medical units in the Reserve Officers' Training Corps is assured for the present, at least.

Page 69 of the Handbook, "Reorganization of Federal Narcotic Service": Your committee finds nothing in the proposed reorganization of the federal narcotic service which would justify the profession in opposing the enactment of this bill.

Page 70 of the Handbook, "Contract Surgeons of the Spanish-American War": Your committee notes that the Bureau of Legal Medicine and Legislation has been persistently active in its efforts to secure legislation providing benefits for contract surgeons of the Spanish-American War. Your committee wishes to add that, while it is apparently impossible to secure such legislation at the present time, the statement that "The beneficiaries of such proposed legislation are not organized and vocal" makes it particularly desirable that the Bureau should continue its interests and activity in this particular matter in the hope that at some future time desirable legislation may be secured.

Page 70 of the Handbook, "Investigation of Silicosis and Other Occupational Diseases": Your committee wishes to point out that the creation of multiple nonmedical agencies for the study of industrial health conditions is not desirable or acceptable to the medical profession. Organized medicine should insist that medical functions be performed by medical men under medical supervision.

Page 71 of the Handbook, "Birth Control Legislation": As this subject is being considered by a special committee, your reference committee will make no comment.

Page 71 of the Handbook, "State Legislation": Your committee wishes to commend especially the Bureau of Legal Medicine and Legislation for assistance given the various constituent state associations in analysis of proposed legislation and assistance in opposing harmful measures. No legislation establishing systems of compulsory state health insurance have been enacted in any of the states.

Page 71 of the Handbook, "Professional Use of Narcotic Drugs": Your committee calls attention to the fact that there seems to be a distinct advantage in the enactment of uniform state narcotic drug acts, as facilitating the enforcement of necessary regulations. Your committee further recommends the inclusion of regulations in control of the production, preparation and distribution of cannabis and the prohibition of the sale of barbituric acid, compounds and derivatives, dinitrophenol and other substances peculiarly potent for harm when self administered. It is recommended that they be sold only on the prescription of licensed physicians, dentists or veterinarians.

Page 73 of the Handbook, in the second paragraph of "Laws Relating to the Practice of the Healing Art": Your committee directs attention to the fact that other states than the one named have enacted physicians' lien laws which have apparently operated in a satisfactory manner with reported benefits to the profession and without injustice to the patient.

The third paragraph, relating to the report by physicians of gunshot and other wounds: Your committee recommends that, where legislation is enacted by which gunshot and other wounds are made reportable by physicians, the medical profession should insist that the same requirements be imposed on every other person having knowledge of the wound and the possible conditions under which it was inflicted.

Your committee further recommends that the American Medical Association go on record as condemning the practice of performing operations designed to alter the appearance so as to conceal the identity of the individual.

Page 73 of the Handbook, "Hospital Service Corporations": As this matter is under special study of the Bureau of Medical Economics, your reference committee will have no further comment.

Page 73 of the Handbook, "Workmens' Compensation": Your committee points out that the regulations governing the selection for a physician to care for an injured employee, as well as the establishment of fee schedules, and the definition of compensable occupational diseases, vary so greatly in the different states that the whole matter will require additional study and some judicial rulings before any uniformity is possible. Those physicians having the treatment of employees injured or suffering from occupational disease should offer their experience as a guide in formulating regulations.

Page 74 of the Handbook, "United States Department of Health": The Bureau of Legal Medicine and Legislation describes the organization setup of various national health activities. The Committee on Legislative Activities will, in its report, transmit the results at a recent conference with the chairman of the special Senate committee investigating executive agencies of the government, with a view to their coordination, as described in the second paragraph on page 75. Your committee wishes to direct especial attention to the first paragraph on page 77, which in summary states that it is believed to be inexpedient for the American Medical Association to seek the establishment now of a United States department of health with a cabinet officer at its head.

Page 77 of the Handbook, "Integration of the Medical Profession": As it is understood that the Board of Trustees has in hand a study of this subject and may possibly report in greater detail than herein set forth, your committee will not comment.

Page 79 of the Handbook, "Cooperation with State and County Associations": The report of the Bureau of Legal Medicine and Legislation herein raises a very important question as to the advisability of carrying on all consultation and correspondence directed to the Bureau of Legal Medicine and Legislation through the offices of the constituent state associations. The question of the facility of this plan would depend very much on the willingness and capacity of the organization of the constituent state associations to care for the additional matter which would pass through their respective offices. Your committee recommends that this subject be brought up for discussion at the next meeting of the Conference of Secretaries of Constituent State Medical Associations in order that it may be given a more thorough discussion.

#### REPORT OF BUREAU OF MEDICAL ECONOMICS

Your committee commends the Bureau of Medical Economics for its continued study of those problems incident to the various experimental plans for the distribution of medical care. The reports of these studies have been from time to time made available to the membership of the American Medical Association, and time would not permit of any detailed discussion here. Your committee directs attention to the fact that the most important studies are still to come and that much will depend on a careful evaluation of these methods and the measure of success attained after a sufficient period of operation. The multiplication of units of unsound principle and faulty organization will not contribute anything to the development of a better method. Your committee would therefore recommend that before any new experimental units are established the situation be sufficiently studied. It is no doubt needless to remind that in considering any proposals certain basic requirements have already been set up by the American Medical Association.

Page 88 of the Handbook, "Medical Relations Under Workmen's Compensation" and "Care of the Indigent Sick": As these matters are so widely at variance in the respective states and are undergoing constant change, repeated revision of the information at hand in the Bureau office is necessary in order that information may be of value.

Page 89 of the Handbook, "University and College Student Health Service": Reference is made to the study of Student Health Services in all the leading colleges of the United States by the Bureau of Medical Economics. This study includes 238 colleges and universities and seventeen colleges for Negroes. Your committee calls attention to the several features of Student Health Service as enumerated on page 90 of the Handbook. Item 6, which reads "It appears that a very large percentage of universities and colleges are actually engaged in the practice of medicine in varying degrees" is of especial interest. No figures are given as to the average charge, if any, to the student for that service. There is no suggestion as to whether or not there may be a substantial item in the amount of tuition charged which is allocated to the medical care of students. There is no information to indicate that the university takes into account capital invested in buildings and equipment devoted to the medical service for the students, or part-time service for additional personnel required in keeping accounts and other things incident to the operation of such service. Your committee

therefore suggests that if possible a cooperation of some of these institutions should be secured for the purpose of securing a fair appraisal of the cost of the service to the student and to the taxpayer and from allocation of endowment funds. If, as indicated, there is a tendency to the creation of additional institutional patterns of health service it would be well for everybody concerned to know the cost of that service.

Page 91 of the Handbook, "Group Hospitalization": There is much reason to suggest caution. This study is still under way. Your attention is respectfully called to the last paragraph on page 94, in which it is stated "Returns to date suggest that the importance of group hospitalization plans has been overstated when measured by the actual number of plans in operation and the number of members enrolled." The absence of accurate financial and actuarial data is emphasized by your committee. The suggestion is made that if these various plans were forced to comply with the principles of insurance laws in the respective states a desirable measure would be provided for safety for the insured and prevent an unfavorable reflection on physicians who, in some instances, are actively favoring the establishment of unsound or insufficiently tried plans.

Page 95 of the Handbook, "Relation of Medical Ethics and Medical Economics": It is unfortunate that this material is not completed and ready for distribution at this time. Your committee commends this effort on the part of the Bureau of Medical Economics to call attention to the economic implications in the Principles of Medical Ethics. Although it is not stated that the Judicial Council has officially construed the various rules referred to in this discussion of the Principles of Medical Ethics, the committee understands that great care has been taken and advice has been had from the Council in determining that the implications set forth are sound in basis. Your committee recommends that as soon as this material is available it shall have broad distribution and shall be given study in the various component county societies, where the responsibility for the enforcement of ethical principles must reside. It must be recognized that unfair economic practice reflects on all and should be just as much a matter of interest to the component society as is other unethical practice.

The activity of the Bureau of Medical Economics in the debate on state medicine is familiar to every delegate and the Bureau deserves the recognition and appreciation of the medical profession for its efforts in the interests of the profession. The proposed program of the Bureau as set forth on page 98 of the Handbook comprises a number of items, each one of which is of much importance. A consideration of the character of the material to be studied indicates the necessity for constant study, analysis and revision, in order that conclusions by which the profession is to be guided may be dependable.

Respectfully submitted.

R. L. SENSENICH, Chairman.  
A. C. MORGAN.  
C. J. WHALEN.  
J. H. IRVIN.  
E. N. ROBERTS.

On motions of Dr. Sensenich, seconded and carried, the report of the reference committee was adopted section by section and as a whole.

#### Executive Session—Tuesday Afternoon, May 12

It was moved by Dr. W. H. Seemann, Louisiana, that the House go into Executive Session, the membership to consist of duly accredited Delegates, the general officers, past and present, the presidents and secretaries of constituent associations and component societies, and the chairman of the Committee to Study Contraceptive Practices and Related Problems, as well as the Invited Guests. The motion was seconded by Dr. Walter E. Vest, West Virginia, and carried.

On motion of Dr. H. A. Luce, Michigan, seconded by Dr. C. S. Gorsline, Michigan, and carried, the courtesy of attendance at the Executive Session was extended to the president-elect of the Wayne County Medical Society.

The Sergeants-at-Arms polled the House, after which the House went into Executive Session.

### Report of Reference Committee on Miscellaneous Business

Dr. H. A. Luce, Chairman, presented the following report:

Your committee considered the resolution dealing with asphyxial deaths, which was introduced by Dr. Frederic E. Sondern, New York, at the request of the Medical Society of the State of New York.

Your committee endorsed the aims and purposes of the Society for the Prevention of Asphyxial Deaths but felt that this resolution gives undue prominence to the subject of deaths from the proper and necessary administration of anesthetics in the rendering of medical and surgical services. It therefore deletes that portion of the resolution embodied in the last whereas.

This deletion is recommended because of the possible interpretation that anesthetic deaths are entirely asphyxial deaths, which is obviously untrue. This interpretation might have the effect of justifying persons in their opinion who are opposed to anesthesia as well as its possible use to further actions for malpractice against members of the medical profession.

With this deletion, the resolution reads:

WHEREAS, The aims and purposes of the Society for the Prevention of Asphyxial Death were approved by the Medical Society of the State of New York, May 14, 1934,

WHEREAS, These aims and purposes were later approved by the House of Delegates of the American Medical Association, June 12, 1934,

WHEREAS, The Society for the Prevention of Asphyxial Death was invited by the Committee on Scientific Exhibit of the American Medical Association to prepare an exhibit for the regular meeting of the American Medical Association, which was held at Atlantic City in June 1935,

WHEREAS, The Scientific Exhibit of the American Medical Association subsidized space for eight booths on the Prevention of Asphyxial Death at this exhibit;

WHEREAS, A favorable impression was created by this exhibit, and the need for an organized movement to prevent asphyxial death was emphasized,

WHEREAS, It has been satisfactorily established that asphyxiation constitutes a major medical problem, representing a mortality of at least 50,000 deaths a year, therefore be it

Resolved, That the House of Delegates of the American Medical Association, at the Kansas City session to be held in May 1936, be petitioned to create a Committee on Asphyxia for the further study of this problem.

With this deletion your committee approves the resolution and recommends its adoption.

Respectfully submitted.

HENRY A. LUCE, Chairman.  
A. J. SCOTT.  
H. B. EVERETT.  
G. HENRY MUNDT.  
HARVEY B. STONE.

It was moved by Dr. R. L. Sensenich, Indiana, seconded by Dr. A. J. Scott, California, and carried, that the report of the Reference Committee on Miscellaneous Business be adopted.

### Committee on Publicity

The Chairman, without objection from the House, appointed the following Committee on Publicity: Dr. Holman Taylor, Texas; Dr. Edgar A. Hines, South Carolina, and Dr. Joseph F. Burnham, Massachusetts, to cooperate with the Editor, Dr. Morris Fishbein.

### Report of Reference Committee on Executive Session

Dr. C. E. Mongan, Chairman, presented the following report:

1. The memorandum from the Bureau of Legal Medicine and Legislation concerning the proposed omission of the item referring to legitimacy and illegitimacy from standard forms for reports of births and stillbirths was not approved. Your committee considered that this was a legal and sociological rather than a medical question.

2. The resolution from the Oregon State Medical Society, asking that the Council on Medical Education and Hospitals withdraw approval from those hospitals which grant special privileges to any of their staff members in the form of lower rates for patients of such staff members, was approved.

3. The resolution from the California Medical Association found on page 38 of the Handbook for delegates was referred to the Reference Committee on Medical Education.

4. Your committee had before it the following report:

### REPORT OF COMMITTEE TO STUDY CONTRACEPTIVE PRACTICES AND RELATED PROBLEMS

Your committee appointed by the Board of Trustees of the American Medical Association in accordance with the resolutions passed by the House of Delegates on June 11, 1935, submits the following report, based on its interpretation of the resolutions.

Contraception as a means of birth control is widely employed. It has been kept before the general public during more recent years by well organized propagandists. From time to time the organized medical profession has been criticized for not giving general attention to the movement. Your committee has reviewed a large amount of the available literature in an effort to secure adequate information on which to evaluate a situation which has far reaching possibilities for good or harm on the future of the human race. Early in this study it became evident that most people, including physicians, are relatively uninformed regarding the entire subject other than as it may be applicable to the family problems of certain individuals. Your committee has deemed it advisable to examine some of the claims which have been made concerning the general use of contraceptives as well as the acceptable medical indications and the possible dangers associated with the present approach to this subject.

### THE PROBLEM OF OVERPOPULATION IN THE WESTERN WORLD

Desire on the part of the human animal to avoid conception as a natural consequence of coitus dates back to antiquity. Propaganda for birth control, based on a growing fear that the world may become overpopulated, started after the formulation of the malthusian theory and still continues. It seemed advisable for the committee to consider available evidence regarding present trends of the white population of the world. Fortunately, several authoritative studies are available.

East, in "Mankind at the Crossroads" published in 1923, in his conclusions states: "If the human race really desires a continued progress, a fair chance, and a longer and happier life for every individual, the birth rate must come down faster and faster; and it must come down throughout the whole population and not merely within the one section which furnishes those of greatest social worth. To accomplish this, parentage must not be haphazard."

Huntington and Whitney, in "The Builders of America," published in 1927, confirm East's observation that race suicide is already the rule among the educated part of our population.

The Brookings Institute published in 1928 and 1931 two extensive studies of "The Balance of Births and Deaths" in Europe. The findings reported in 1928 are briefly summarized as follows: "According to the fertility and mortality rates in western and northern Europe in 1926, 100 mothers gave birth to 93 future mothers only. With the fertility of 1926 the population is bound to die out unless mortality of potential mothers decreases beyond reasonable expectations. And the fertility continued its downward path in 1927." In the director's preface to the 1931 report he says: "This second volume shows that similar conditions prevail in some countries of Central Europe, like Austria, Estonia and Latvia. In other countries, for instance, Italy and Poland, the population is growing, but at a slower rate than in former times since fertility has decreased much more than mortality. The only European country which has a genuine increase of over one per cent—as a matter of fact almost two per cent—is Russia. . . . The earlier volume showed that there is no foundation for the general belief that the decrease of fertility in western and northern Europe was offset by a decrease of mortality. In this volume we see that there is no foundation for the general belief that the decrease of fertility is confined to the nations of the Western civilization."

Lorimer and Osborn, in their "Dynamics of Population," published in 1934, state in their conclusions: "It is impossible to make reliable long time pronouncements about the future total population of the United States. But there can be no doubt that the period of rapid natural increase is now coming to an end. . . . Population trends have run their course in the past with little attention by any one to their momentous influence on human destiny. Variations in fertility, although controlled by individuals, are indirectly determined by particular social factors. It is evident that the social conditions which affect reproduction might be modified in a number of ways, so that the dynamic influences of population change would be more in line with conscious social objectives. Eventually, if our dream of human progress is to be realized, rational social action must replace the operation of blind forces in this as in other fields. In the furtherance of this ideal there is need both for more exact science and for a larger appreciation of the possibilities and values of life."

#### EUGENIC CONSIDERATIONS

Our present knowledge regarding human heredity is so limited that there appears to be very little scientific basis to justify limitation of conception for eugenic reasons. However, it is recognized that there are a few congenitally transmissible diseases, for instance oxycephaly, Huntington's chorea, hereditary optic atrophy, otosclerosis, and familial cases of Friedreich's ataxia. There is conflicting evidence regarding the transmissibility of epilepsy and mental disorders.

No evidence was found which would indicate that wider dissemination of contraceptive information would tend to establish a better social and economic equilibrium in society. At present the part of our population with the best education and presumably the most competent socially and economically is not reproducing itself. Birth control propaganda is partially responsible for this condition.

#### ECONOMIC CONSIDERATIONS

Your committee has found no evidence available to justify the broad claim that dissemination of contraceptive information will improve the economic status of the lower income groups, although it is admitted that some individuals might thus profit by limitation of their family. Your committee knows of no type of contraception which is reasonably adequate and effective for a large portion of the population.

#### MORAL CONSIDERATIONS

Coitus is accepted as a normal marital function, but differences in opinion arise as to methods of preventing conception. Apparently there is no moral objection to selection of the assumed nonfertile portion of the month for coitus by married couples.

#### MEDICAL CONSIDERATIONS

Your committee recognizes that voluntary limitation of conception may be necessary to safeguard the health of some women. Pregnancy is medically undesirable, and may be actually dangerous for the woman who has active tuberculosis, acute or chronic nephritis, some types of heart disease, some psychopathic conditions including recurring puerperal insanity, arteriolar sclerosis, chorea, some types of anemia, especially pernicious anemia, malignant diseases (including the hematopoietic), polyneuritis, recent major surgical or obstetric operations, recent serious illness, phlebitis, recent pelvic infection, pyelitis, traumatic rupture of the symphysis or pelvis which has not healed, and possibly a few other conditions in women who may not be naturally physically capable. However, it must be recognized that the capacity of women to bear children without impairment to health is an individual matter and varies to such a degree that no general rules can be offered here.

Marriage of individuals who have mental or physical abnormalities which contraindicate reproduction ordinarily should be discouraged.

There has been an extensive development of preparations and devices for preventing pregnancy. Some of these are

more or less physically harmless, some are relatively effective when used intelligently, others have little or no value. All mechanical devices which are introduced into the cervix or corpus uteri are potentially dangerous to the life and health of the woman. Many deaths and an even larger number of serious pelvic complications have been reported in the literature, and the members of the committee have knowledge of many unreported cases of serious illness from the use of intra-uterine devices. There are available several publications offering scientific evaluation of the effectiveness of various contraceptives. No contraceptive technique other than actual continence is intrinsically 100 per cent safe. The efficiency of all present methods depends on intelligent use. None are dependable for couples who are intoxicated, subnormal or lacking in self control. There is evidence that many women who have abortions performed are familiar with contraceptive measures but seek an abortion when the method fails.

The committee has been unable to find evidence that existing laws, federal or state, have interfered with any medical advice which a physician has felt called on to furnish his patients. Clarification of such laws, however, is desirable. The committee suggests the advisability of legislation to standardize and control the manufacture and distribution of contraceptive materials.

The members of your committee do not favor independent so-called birth control clinics, believing that needed contraceptive advice should be a matter for proper medical decision in the care of individual women. Furthermore, a physician who for other than medical reasons considers it improper to give any information or advice that might aid his patient to practice contraception should not be criticized because he refuses to furnish such information or advice even when from a medical standpoint pregnancy is contraindicated. In the opinion of your committee, however, such a physician should not dissuade a patient from obtaining contraceptive advice. When a medical reason for avoiding pregnancy exists, in the opinion of the committee it is the duty of the attending physician, regardless of his personal beliefs, to inform the patient of her physical condition and the hazard of pregnancy.

Your committee is of the opinion that the medical profession should be familiar with the many problems associated with birth control. Contraceptive practices are only an incident in the broader problem. In view of the fact that many marriages are childless, physicians should inform themselves regarding the entire subject of fertility. It is suggested that more complete education in this particular field be given to medical students. A survey recently published shows that the actual teaching of this subject is ignored in the curriculums of many medical schools.

#### RECOMMENDATIONS

The committee considers that this is necessarily an incomplete report and from its study to date makes the following recommendations:

1. That a committee be appointed to continue a study of Birth Control and to report further to the House of Delegates.
2. Steps should be taken by some responsible group to develop standards for judging contraceptive materials.
3. Your committee desires to record its disapproval of propaganda directed to the public by lay bodies, organized solely for the purpose of disseminating (without consideration or restraint) contraceptive information. Your committee deplores the support of such agencies by members of the medical profession. We feel that an entirely false sense of values with respect to the important function of childbearing and of parenthood has been created by the activities of such organizations.

Respectfully submitted,

CARL HENRY DAVIS, Chairman.  
GEORGE W. KOSMAK.  
JAMES R. BLOSS.  
JOHN ROCK.  
WILLIAM C. WOODWARD.

The interim committee appointed to consider this subject has given much time and labor to its study. Your reference committee thinks that the committee has approached the subject in an absolutely impartial manner and would especially call attention to that part of the report which considers aspects of the question of birth control which are purely medical but are related to the subject matter. The problems of overpopulation in the Western world, eugenic, economic, moral and medical considerations, are thoroughly dealt with.

Your reference committee approves the first and third recommendations of the Committee to Study Contraceptive Practices and Related Problems but does not approve the second. It does not feel that there is yet sufficient knowledge of the subject to go that far and feels that disapproval of certain contraceptive devices would by inference approve others.

Respectfully submitted.

CHARLES E. MONGAN, Chairman  
W. ALBERT COOK.  
FLOYD S. WINSLOW.  
WINGATE M. JOHNSON.  
BRIEN T. KING

On motions of Dr. Mongan, duly seconded and carried, the first two sections of the report were adopted.

Dr. Mongan moved that the report of the Committee to Study Contraceptive Practices and Related Problems be accepted. The motion was seconded by Dr. J. Newton Hunsberger, Pennsylvania, and carried.

On motions of Dr. Mongan, duly seconded and carried, the first and third recommendations contained in the report of the Committee to Study Contraceptive Practices and Related Problems were adopted, while the second recommendation was not approved.

The report of the Reference Committee on Executive Session was adopted as a whole on motion of Dr. Mongan, seconded by Dr. J. Newton Hunsberger, Pennsylvania, and carried.

Dr. Mongan proposed a vote of thanks to the Committee to Study Contraceptive Practices and Related Problems. This was seconded by Dr. Arthur J. Bedell, New York, and carried.

The House rose from Executive Session, on motion of Dr. W. H. Seemann, Louisiana, seconded by Dr. J. Gurney Taylor, Wisconsin, and carried.

#### Resolutions on Proposed Legislation Dealing with Helium

Dr. Samuel J. Kopetzky, New York, introduced the following resolutions, which were referred to the Reference Committee on Hygiene and Public Health:

WHEREAS, A certain act passed by the House of Representatives and now awaiting action in a Senate committee provides for five million cubic feet of helium to be made available for medical treatment as well as for medical research, and

WHEREAS, The present law provides for medical research only, and

WHEREAS, Helium is of marked therapeutic value in asthma and obstructive lesions in the trachea and larynx, be it

Resolved, By the House of Delegates of the American Medical Association that it approves the allotment of this comparatively small amount of helium at government cost, which would make the therapeutic use of this gas more generally available than it now is, because now it is supplied by one commercial company which controls the private supply, and be it further

Resolved, That we urge the passage of the pending measure before the Senate.

#### Resolutions on Appointment of Committee to Study Problems of Motor Vehicle Accidents

Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The street is a battlefield and thousands of our citizens are killed and disabled by reckless incompetent and physically disqualified individuals, and

WHEREAS, The medical profession has stood for centuries past for the safeguarding of life and the prevention of injury, therefore be it

Resolved, That a committee of five be appointed by the President to survey and study the problems of motor vehicle accidents and injuries therefrom, and report to the House of Delegates, and be it

Resolved, That an appropriation sufficient to cover necessary expenses be provided for the study

#### Resolution on Appointment of Committee to Propose Amendment to By-Laws Providing for Fitting Recognition to Fellows Rendering Distinguished Service in Science of Medicine

Dr. H. H. Shoulders, Tennessee, submitted the following resolution, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

WHEREAS, There are a number of Fellows of the American Medical Association who have made noteworthy contributions to the science and art of medicine, and

WHEREAS, There does not exist a provision in the Constitution and By-Laws of this Association whereby fitting recognition of such contributions can be made in an official manner by the American Medical Association, therefore be it

Resolved, By the House of Delegates, that the Speaker be authorized and directed to appoint a committee of five members of the House whose duty it will be to consider this question in association with the Judicial Council, and to propose an amendment to the By-Laws whereby suitable recognition in the form of a medal, testimonial or other recognition may be given to Fellows of the Association who have rendered distinguished service in the science of medicine

#### Resolutions Concerning Graduates of Medical Schools of Foreign Countries

Dr. William R. Molony Sr., California, presented the following resolutions, which were referred to the Reference Committee on Medical Education:

WHEREAS, Through the initiation, support and watchfulness of organized medicine, standards of medical education and medical practice have rapidly and continuously advanced, and

WHEREAS, There is a serious danger of this most satisfactory state of progress being undermined, and weakened by the registration to practice of graduates of medical schools of foreign countries, and

WHEREAS, There are at the present time more than 1,500 American students attending medical schools in foreign countries, many of them not having satisfactory credentials for admission to American medical schools, and

WHEREAS, There is in the files of the Council on Medical Education and Hospitals of the American Medical Association, and the Federation of State Medical Boards, evidence that many of the foreign medical schools do not consistently maintain and enforce the same high standards as are maintained in the medical schools of the United States, there fore be it

Resolved, That each applicant for medical license in the United States, in order to adjust this inequality and to show a knowledge of acceptable medical practice, should be required before being admitted to a written examination before a properly constituted examining board to hold a license to practice in the country of his graduation and a certificate that he has completed a year's work as an intern in a hospital approved for internship training or should complete the fourth year in an American Class A medical college, and be it further

Resolved, That the House of Delegates of the American Medical Association approve the foregoing and that a copy be sent to the properly constituted officers of each examining board of the United States and to the Federation of State Medical Boards, with the request that they consider seriously urgent need for the adoption of such rules and/or legislation necessary to put the purposes of these resolutions into effect

#### Resolution Requesting That State Association Be Notified When Hospital is Threatened with Removal from Accredited List

Dr. John W. Ames, Colorado, introduced the following resolution, which was referred to the Reference Committee on Medical Education:

WHEREAS, Protection of the inherent rights of the state medical societies which form the American Medical Association is a primary function of this House of Delegates, and

WHEREAS, Promotion of state medical society activity and respect for state medical society responsibility are established policies of this Association, and

WHEREAS, The officially stated policy and customary procedure of the Council on Medical Education and Hospitals in regard to hospital ranking is a definite negation of these democratic and time honored doctrines, the said Council having ignored the rights of state medical societies and having subsequently denied a respectful petition for correction of such procedure, as will be made clear by detailed documentary evidence accompanying this resolution, and

WHEREAS, As the result of summary and important actions taken by the Council without informing or consulting the interested state medical societies, uncertainty and resentment toward the Council exists in several states, inimical to the general policies of the Association, harmful to the welfare of its members, and deterrent to the ends sought by the Association through the said Council, now therefore be it

Resolved, By the House of Delegates of the American Medical Association that the Council on Medical Education and Hospitals, in all actions

concerning the ranking of a hospital, shall notify the constituted authorities of the interested state medical society and shall allow said society a reasonable opportunity to be heard before the Council makes its decision.

### Report of Judicial Council

Dr. George Edward Follansbee, Chairman, presented the following report, which was referred to the Reference Committee on Sections and Section Work:

With regard to the resolutions respecting the use of audiometers, presented by Dr. Burt R. Shurly for the Section on Laryngology, Otology and Rhinology at the 1935 annual session of the Association, the following substitute resolutions are recommended:

WHEREAS, Certain mechanical aids for physical defects are now being sold through the promise of a commission to persons effecting such sales; therefore be it

Resolved, That the practice of offering any commission or bonus to any physician or to any person not an authorized agent is condemned as unfair to the purchaser of mechanical aids, and the acceptance of such commission by a physician violates the Principles of Medical Ethics; and be it further

Resolved, That the fitting of such aids or appliances by laymen without medical supervision constitutes the practice of medicine and should be brought to the attention of the offending manufacturer and of the competent medical licensing authority concerned. Fraudulent, exaggerated or inaccurate claims for such devices may work great hardship on handicapped individuals. Such appliances require investigation by the Council on Physical Therapy of the American Medical Association, or other equally competent authority, and approval by the said Council before publication of any such statements.

### Proposed Amendments to Constitution and By-Laws

Dr. George Edward Follansbee, Chairman, Judicial Council, in accordance with the notification contained in the Supplementary Report of the Judicial Council, presented the following proposed amendment to Article 8, Section 1, of the Constitution, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

Amend Article 8, Section 1, of the Constitution to read "Members in good standing of the constituent associations who are not now serving and have not served within twelve months sentences for felony are the members of the American Medical Association, subject, however, to the provisions of the By-Laws regarding members."

Dr. Follansbee also presented the following proposed amendments to the By-Laws, which were referred to the Reference Committee on Amendments to the Constitution and By-Laws:

Amend Chapter V, Section 1, fourth sentence, to read "With the approval of the Board of Trustees he is authorized to appoint committees, (a) requested by the Councils, and (b) for emergencies and purposes not otherwise provided for."

Amend Chapter IX, Section 1, the second power invested in the Judicial Council, to read "(2) all controversies arising under this Constitution and By-Laws, and under the Principles of Medical Ethics, to which the American Medical Association is a party."

Add to Chapter IX, Section 1, the paragraph "The Judicial Council shall have authority in its discretion from time to time to request the President to appoint investigating juries to which it may refer complaints or evidence of unethical conduct which in its judgment are of greater than local concern. Such investigating juries, if probable cause for action be shown, shall report with formal charges to the President, who, under Chapter V, Section 1, of the By-Laws, shall appoint a Prosecutor, who, in the name and on behalf of the American Medical Association, shall prosecute the charges against the accused before the Judicial Council. The Council shall have the power to acquit, admonish, suspend or expel the accused."

### Report of Committee on Legislative Activities

Dr. E. H. Cary, Chairman, presented the following report, which was referred to the Reference Committee on Legislation and Public Relations:

Your Committee on Legislative Activities begs to report that several meetings have been held by the committee, usually at a time when it was possible to report to the Board of Trustees certain points of interest which the committee members had given prior consideration. The Board of Trustees, after thorough discussion, has accepted these reports. The discussions

and suggestions made by various of the Board members regarding the problems which concerned medical practice everywhere have been exceedingly valuable to your committee.

On this occasion, we beg to present a brief summary of the more important problems which have come within the scope of our activity and with which we dealt according to our best judgment, and we hope, in this connection, that our action will meet your approval.

As time has elapsed, the different members of the committee have been enabled to understand more definitely the wishes of the medical profession and various groups interested in medicine, all of which has broadened the activity of the committee.

Dr. R. L. Sensenich, through the bulletins which he sends regularly to the secretaries and presidents of the state societies, as well as to you gentlemen as members of the House of Delegates of the American Medical Association, has stimulated many suggestions which have been most practical and effective. One suggestion, especially, which would have us encourage a sounder economic philosophy in the secondary schools and colleges, will undoubtedly bear fruit that will be observed in the young aspirants who become medical students. We recognize the limitations of this effort for we are thinking of the young men who are to become doctors, but if we succeed in having young doctors better versed in sound economic and social philosophy, unquestionably the medical graduate will be more apt to appreciate the traditions and opportunities of this noble profession and will make his efforts harmonize with those of his fellow practitioners.

At our meeting with the Board of Trustees in Chicago in February, it was concluded that Dr. William C. Woodward would act in the capacity of adviser to the Committee on Legislative Activities.

In this connection, we would make mention of the contacts and diligent effort on the part of Dr. Woodward and members of our committee to see that Senate Amendment 39 was retained in the War Appropriation Bill, number 1937, H. R. 11035. This amendment has to do with the continuance of medical units in the Reserve Officers' Training Corps. Another matter in which Dr. Woodward and the Chairman of your Legislative Committee have worked in cooperation is the important item of compensation for contract surgeons who served in the Spanish-American War. We have exerted every possible influence, but our personal opinion has been that the fewer requests made in Washington for the benefit of the profession, the stronger our position would be when opposing legislation detrimental to our cause. Further reference will be made to this point later in this report.

We wish to report the activities of another of our members, Dr. F. S. Crockett. Last summer Dr. Crockett, as a member of the American Farm Bureau Federation, had an opportunity to contact the executive secretary of the women's subsidiary organization of this group. On seeking the advice of the Chairman of our committee, Dr. Crockett was asked immediately to go forward with plans for a conference.

Through this contact, Dr. Crockett learned that in this group, as in many others, there was a radical element which oftentimes caused the more conservative members a great deal of embarrassment. The more radical members had passed a resolution endorsing social insurance, which resolution would be referred to the parent organization and would have been adopted by it.

The American Farm Bureau Federation had already had a meeting at which a rousing address was made by the head of a much advertised organization engaged in proposed medical group service. His analysis of the matter as represented was considered tangible evidence of the effectiveness of the insurance plan.

Fortunately, Dr. Crockett was able to cause a change of attitude on the part of executive members of the women's groups. The gratifying result was that, at the instance of these same women, the Farm Bureau adopted a resolution which instructed the president of the organization to appoint a committee to conduct research along the line of what might be done and invited the cooperation of the American Medical Association.

The American Farm Bureau Federation, composed of about three hundred thousand families, is headed by a gentleman who has considerable influence in Washington circles. If the

women's organization had been allowed to drift, the announcement of the president of this federation, with an approximate membership of one million two hundred thousand persons, would in all probability have been "We are in favor of social insurance."

There are two other groups representing an equally large number of people which will be influenced by the decision of the Farm Bureau.

Dr. Crockett, in cooperation with the Committee on Legislative Activities, arranged for a conference with three of the executive members of the Farm Bureau, which was held in Chicago last February.

Our conference disclosed many interesting points: They were not asking for free medical service; they did feel some adjustment should be made in the mileage fee plan; they were deeply interested in securing more adequate medical care for rural communities everywhere. It was agreed that immediate steps should be taken to study a solution for both the important fee problem and the amount of available medical care in the rural sections.

We called the Director of the Bureau of Medical Economics into conference at this time. It was agreed that the Board of Trustees would be asked to authorize Dr. Leland to develop a questionnaire which would be submitted to the Farm Bureau group for approval. It was also understood that this questionnaire would be discussed with the proper individuals in the respective state and county medical societies. We hoped that, through this cooperation on the part of so many forces, valuable information might be obtained on the questions which had been raised at the conference. (A copy of the questionnaire is attached to this report.)

At the time the questionnaire was prepared, a letter was sent to the state secretaries requesting information along the same line. (A copy of the letter is attached to this report.)

A recent letter from the Bureau of Medical Economics informs us that replies to these letters have come in from sixteen states. This does not represent a majority, of course, but the information so far developed indicates that localities lacking medical services are extremely elusive. The secretary of the Michigan State Medical Society sent copies of the questionnaire to secretaries of the county medical societies, and replies from a number of these have come in. It is found that there is almost complete uniformity in the replies. An excerpt from a letter received from the secretary of the Medical Association of the State of Alabama follows:

In reply to your letter of the first instant, I beg to advise that this office has not received from any source complaints of a lack of necessary medical services in the rural areas of Alabama. Of course, there are some locations desirous of having a resident physician but there are not many such and even they are within a reasonable radius of a physician. No plans are in operation or proposed to provide medical services to rural communities.

Also, Georgia reports that a medical economics survey is under way and will be shortly published in their journal. Several state secretaries report that replies have been received from certain localities where it was thought a physician was needed, but investigation has shown that medical services were supplied from nearby places and that it would be impossible for a physician to obtain any reasonable income in such locations.

The data given here are more in the nature of a preliminary report.

The subject of fees based on mileage requires further study. We believe there are inequalities due to conditions involving time and cost of transportation. It is recommended that each state and county society study this problem in its respective area in order that readjustments may be made that will relieve the profession as a whole from the implications of unfair charges in the rural districts.

The latest information that we have from the Associated Women of the American Farm Bureau Federation is that the questionnaire has not developed all the information that they desired. They seem at this time to be more interested in some plan involving the insurance principle. This leaves the matter for further consideration on the part of the committee and we hope that Dr. Crockett, who is on the ground, will be able to bring new information to the women regarding this subject.

We, as a profession deeply interested and responsible for the welfare of these people, must not lose sight of the fact that the main thing is to continue our effort in trying to find the right solution for the social problems which touch the practice of medicine.

Our last report to the Board of Trustees made mention of one or two phases of service relating to the Civilian Conservation Corps. The members of this group, as we understand it, come under the United States Employees' Compensation Act and are permitted to go into any government hospital. It seemed that veterans were objecting to this practice so far as it was related to Veterans' Administration hospitals.

A second complication was the refusal on the part of a number of hospitals to allow full time doctors employed by the government camps to practice in the hospital. In several states it was determined that the Civilian Conservation Corps doctors be licensed in the state and be members of the state medical society. However, in many cases the available physicians were not members of the state society and were not licensed in the states where they were assigned to duty. Our committee decided to take no action, as it is a subject for each state licensing board to determine according to its own legal requirements.

Sickness insurance has been thoroughly discussed. Plans for the distribution of medical care to low income groups are being tried by various county societies. Large industrial interests have approached physicians and county medical societies with plans for the medical care of their employees.

Your Committee on Legislative Activities calls to the attention of the delegates and, through them, to the attention of all constituent associations and component societies, the fact that the attitude and decision of the profession on this question are of utmost importance. It may readily be seen that the profession will lose its continuity of thought and action if its members vary from the principles which have been laid down to guide those active in bringing about contractual relations with any group.

We would now bring you a brief résumé of our recent trip to Washington.

Our visit to the Veterans' Administration disclosed the interesting information that, of the total of 45,673 available beds in veterans' institutions, 2,540 were unoccupied; that there were only 206 service-connected cases awaiting admission. Other details can be had from the committee if desired.

Our committee had received complaints and definite information was requested. We were informed that the regulations as to eligibility of veterans are being strictly respected and that it is believed that the average period of residence in government hospitals will compare favorably with that in civilian hospitals. In some instances the patients have no homes to which they can be discharged, but, on the whole, patients are not retained in hospitals longer than is absolutely necessary. Aside from small additions to existing facilities for neuropsychiatric cases and disabled colored veterans, we were informed there was no reason for additional hospital construction.

Another point of particular interest to us was the statement, made by the medical director of the Veterans' Administration, that every effort was being made to maintain the quality of medical service on a high standard and that an endeavor was being made to stimulate research in the special groups, such as cancer and neuropsychiatry.

The medical associate of the officer of the American Legion in charge of rehabilitation stated that the medical service rendered to the veterans was of high standard and that he had not had any complaint. The officer referred to indicated his interest in the medical service. He expressed the hope that a study may be made with a view to maintaining the medical service at a high standard and to providing the greatest utilization of the material it affords for investigation and research. In this study he stated that it would be desirable to have the advice of members of the medical profession outside of the Veterans' Administration.

He expressed appreciation of the helpful and happy relations existing between the American Medical Association and the American Legion. The committee is confident that the facilities of the American Medical Association will be made available

for the purpose outlined on the invitation of the agencies directing these activities.

We are happy to state that there is nothing unusual occurring in veterans' legislation, despite the innumerable bills introduced into Congress, which would affect veterans' care in some phase.

Information was also developed that the American Legion is not pressing demands for the erection of additional new hospitals.

Being deeply interested in the claims of the contract surgeons of the Spanish-American War, we visited a distinguished gentleman who devotes considerable time and activity to this group of veterans. He stated that it would be impossible at this time to secure such legislation for the principal reason that there are many other groups who rendered service under similar conditions and that legislation to benefit contract surgeons would invite increased pressure from the other groups for comparable benefits. He stated that the amount involved in dollars and cents to care for the contract groups of the Spanish-American War was not large but that there were 170 groups which served similarly in the recent war. It was pointed out that the War and Navy departments had opposed the establishment of the principle involved in extending benefits to civilian employees who served under similar conditions. Two reasons were offered, the first being the difference in rate of pay in favor of those so employed, and the second being that under most conditions the individual was supposed to have had an opportunity to enlist in the regular service and thereby become eligible to service benefits.

However, it was explained that this second point did not apply to medical contract surgeons in the Spanish-American War for the reason that units entering the service were organized under laws of the states from which they came, and in many instances no provision was made for medical officers in time of war in excess of the needs of skeleton peace-time organization. The pension laws provide for female war-time nurses because no provision was made for the enlistment of female nurses in the armed forces of the United States until after the Spanish-American War.

This gentleman was sympathetic toward the need of contract surgeons and stated that he would be glad, at the proper time, to direct his energies and enlist the backing of the organizations in which he is active to secure the enactment of such legislation.

We conferred with several distinguished senators who are in close touch with the Food and Drugs Act. We found why and how it had been amended. It was finally passed in the Senate, with the thought on the part of the senators who had been interested in its welfare that the legislation was good and was necessary and that later the bill might be amended.

Our conference with the chairman of the subcommittee of the House was very interesting. This gentleman and the members of his committee are deeply concerned in writing an effective Food and Drugs Act. We learned from others that the President is very much interested in having an effective bill passed.

The hour spent in the Department of Agriculture with the director of the Food and Drug Administration was very instructive. The chairman of the subcommittee of the House expressed appreciation of the interest and helpfulness of the American Medical Association. We were led to believe that organized medicine could be of tremendous assistance in the enactment of desired legislation.

We are happy to inform you that we contacted the chairman of the important committee which has been given instruction to consider the possible reorganization and coordination of the executive agencies of the government in the interests of efficiency and economy. The attitude of your committee was of proffered assistance or advice in the event that the proposed changes would in any way reflect on or involve medical service. We were advised that the committee had only begun its studies and was at this time considering only economic problems, and that it would probably be next October or November before anything relating to medicine would be discussed.

We learned that the chairman realizes the tremendous cost of sickness insurance and is vitally interested in the matter of efficiency and economy for the government. May we interpolate that, under such circumstances, sickness insurance would certainly not fit into the plans of the committee?

Our visit to the narcotics division disclosed some appalling evidence which substantiated the information that licensing boards permit 80 per cent of the physicians convicted of the illegal use of narcotics to continue in practice. We saw evidence that in one instance a physician purchased 65,000 half grain morphine tablets in six months. His license was not revoked although the facts were presented in court. In many cases it is difficult to obtain acceptable proof of administration of narcotics, but it would seem that known facts of this nature would be sufficient to bring about a revocation of license. Apparently the narcotic division is trying to cooperate with the state authorities. We were informed that the federal department does not take the initiative in regard to such violations or in enforcing them unless there is abundant evidence that an individual is an intentional trafficker in narcotics or is knowingly engaged in illegal use of drugs.

We had a pleasant contact with medical associates in the Children's Bureau of the United States Department of Labor. These gentlemen were in charge of the Maternal and Child Health Service and the Services for Crippled Children. We had the pleasure of discussing the manner in which these activities should be organized in the different states. Because state programs are acceptable to the Bureau after certain basic requirements have been met, there is, accordingly, considerable variance in the manner in which the work is directed. In fully half the states, the direction of the work rests with the state department of public health; in others, the departments of public health have held to the formula that public health service should in no way enter into the treatment of the individual. Here, departments of public welfare or other agencies have been set up for the administration of this activity.

The gentlemen with whom we talked are physicians of years of experience in private practice and gave evidence of a sympathetic point of view in considering the medical profession in the administration of this activity. They pointed out that the wording of the Social Security Act and the instruction of their superiors is to the effect that the medical profession shall under all circumstances be consulted, their wishes respected and their cooperation sought.

It was made clear, however, that if the medical society of the state shows no interest or is unable to secure satisfactory state organization for the administration of the act, the Bureau representatives in Washington are unable to particularize sufficiently to solve medical problems which obviously must be handled locally.

These questions deserve our most careful consideration. We must cooperate to develop plans which will preserve all the rights of the private practice of medicine. The officials in charge of this work at present are in sympathy with our ideals. The wrong plan, however, based on a few unsound principles, could easily prove to be the opening wedge for further inroads on the private practice of medicine which would be difficult to stop.

The medical men in this department are anxiously seeking the guidance of members of the medical profession. The leaders of medicine should be intimately associated with health authorities so that no plan, obnoxious or unworkable, will be devised to distribute these governmental benefits throughout the various states.

Your committee renewed its friendly contact with the American Federation of Labor. This organization is not in favor of sickness insurance. In fact, it can be said that Labor can be placed on record as being opposed to "company doctors," "contract doctors" and "political doctors"; that it wishes only employment under conditions compatible with health and reasonable living standards, and that it will care for its own medical problem.

The Chairman of your committee had the pleasure of an interesting visit with the new head of the United States Public Health Service. This gentleman points to his record as a public servant in New York as indicative of his attitude toward the private practice of medicine.

He spoke of the tremendous responsibility involved in expending the huge sum of money which has been placed in his hands. He requested the cooperation of the medical profession and is apparently deeply interested that whatever activity may come about from the expenditure of this money will meet the approval of the leaders and members of the state medical societies.

Your Chairman became convinced that this gentleman is interested in the present activities of the Public Health Service.

If these activities are broadened, the profession will have ample time for discussion.

The information was developed that statistics now being gathered on health conditions throughout the United States would be distributed and that members of the medical profession and others interested would be asked to make a preliminary study for the purpose of evaluating the matter before it is finally published.

Respectfully submitted

E. H. CARY, Chairman.  
F. S. CROCKETT.

#### QUESTIONNAIRE ON RURAL MEDICAL CARE, FARM BUREAU INVESTIGATION

1. Population of each locality or district.
2. What proportion of the farm population in each locality or district is composed of  
Farm owners                      % Tenants                      %
3. Occupational pursuits in each locality or district  
(Underline the pursuit which predominates, check other pursuits which exist)
  1. Agriculture.
  2. Mining
  3. Dairying and dairy products.
  4. Truck gardening and canning
  5. Lumbering.
  6. Stock raising (grazing)
  7. Fishing industries.
4. Is the population of such localities able to support necessary medical facilities by any system, or will it be necessary to include the possibility of state or federal assistance to maintain such facilities?
5. Give distances to nearest surrounding towns or cities
6. To what extent have conditions been changed in recent times by automobiles and good roads which attract medical patronage to more distant centers?
7. What organizations, existing in such localities, is it proposed to use for purposes of investigation, or as a nucleus for the financial organization of medical care?
8. How numerous are the instances of inability to secure needed medical care in specified localities? Give list of places
9. Have these localities had practitioners of medicine within the past ten years that have not been able to make a living?
10. What sort of medical facilities appear to be needed—hospitals, physicians or others?

#### LETTER FROM DR. LELAND'S OFFICE

To State Secretary

.....

Dear.....

The Bureau of Medical Economics has received many requests for information concerning rural medical service and plans for its reorganization. In order that the Bureau may answer these requests intelligently, it is necessary to ask the help of the secretaries of state medical societies in procuring accurate and detailed information on this subject.

We shall greatly appreciate your help in locating any facts in regard to rural medical service in your state. Have you received, from any source, complaints of a lack of necessary medical services, and if so, in what counties? Do you know of any plans in operation or proposed to provide medical services to rural communities, such as subsidies to physicians by local governments or organizations, cooperative hospital or medical service associations or any similar plans to provide medical care for the rural areas?

We shall also be glad to be informed of any investigations of rural medical service made by any person or organization in your state, and especially if the state medical society has made or is contemplating any such study. If you will assist us in collecting information on this subject we shall be glad to reciprocate by placing at your disposal any facts gained from the general study.

Sincerely yours,

BUREAU OF MEDICAL ECONOMICS

#### Address of Mr. Will Shafroth

The Speaker introduced Mr. Will Shafroth of the American Bar Association, who addressed the House as follows

*Mr. Chairman, Members of the House of Delegates:*

I am very pleased and proud to bring you the greetings of the American Bar Association. I am also glad to have an opportunity personally to thank you for the courtesy you

extended me in permitting me to be present at your sessions this afternoon. I want to say that I have been very much impressed with this deliberative body from the time that it was convened yesterday morning at ten o'clock and thirty seconds until the present moment. I feel that a representative parliament of the medical profession is one of the reasons for the greatness of your national association, and I know you will be interested to know that at the meeting of our association in Boston this summer a provision will be introduced for the amendment of our constitution to create a house of delegates of the legal profession.

We really have a great number of problems in common, and as I sat here I was very interested to hear talk of the integration of the medical profession. We now have seventeen states where they have an integrated bar. I was interested to hear talk of the closer investigation of the character of medical students—a thing that we are trying to do as to students who are seeking admission to the bar. You had a resolution as to medical lists; we have a great problem as to commercial law lists. Those problems are all interrelated, and I hope that as time goes on we will have a continuously closer association with you.

I want to thank you very much for this opportunity and it is a great pleasure to be here.

#### Membership in County and State Associations for Members of Staffs of Hospitals

Dr. G. Henry Mundt, Illinois, asked that Dr. W. D. Cutter, Secretary of the Council on Medical Education and Hospitals, be requested to address the House of Delegates with respect to the progress made in carrying out the provisions of a resolution adopted at the Cleveland session, which declared that members of approved hospital staffs should be members of component county and constituent state associations.

Dr. Cutter addressed the House, declaring that progress had been made in carrying out the purposes expressed in the resolution and explaining the difficulties that had been encountered. He expressed the opinion that it would require a considerable time to accomplish the desired ends but stated that the Council was in sympathy with the purposes of the resolution and would continue its efforts to secure the accomplishment of those purposes.

#### Executive Session

The House went into executive session to hear a supplementary report of the Reference Committee on Executive Session.

#### Supplementary Report of Reference Committee on Executive Session

Dr. C. E. Morgan, Chairman, presented the following report:

Your reference committee finds that the failure of state licensing boards to take disciplinary action against physicians reported to them by the United States Commissioner of Narcotics as having violated federal narcotic laws or as being narcotic addicts has on two occasions led to threats of federal legislation that would in some or in all cases make the right of every physician to use narcotic drugs professionally contingent on permits issued by some federal officer duly authorized for that purpose.

In the opinion of your committee the matter of licensing physicians should be kept strictly within the jurisdiction of the several states. Your committee recommends, therefore, that the several constituent associations take up with the medical licensing boards of their respective states the matter of disciplinary action in cases such as those described, with a view to the adoption of such action in appropriate cases, and that the constituent associations seek such further legislation, if any, as may be necessary to permit the accomplishment of that end.

Respectfully submitted.

CHARLES E. MORGAN, Chairman.  
FLOYD S. WINSLOW.

WINGATE M. JOHNSON.  
W. ALBERT COOK.  
BRIEN T. KING.

On motion of Dr. Morgan, seconded by Dr. J. Gurney Taylor, Wisconsin, and carried after discussion during which it was suggested that the matter be taken up at the Annual Conference of

Secretaries of Constituent State Medical Associations in November, the report was adopted.

The House rose from executive session on motion of Dr. J. Gurney Taylor, Wisconsin, seconded by Dr. John Z. Brown Sr., Utah, and carried.

#### Address of Dr. Leon Asher

The Speaker presented Dr. Leon Asher, Bern, Switzerland, who addressed the House as follows:

*Mr. Chairman, Gentlemen, Colleagues:*

I would like to say, and I hope you will accept it: It is a very great honor for me to be amidst you. By American hospitality I am visiting very many universities, but I have also opportunities of seeing the medical profession in its activities and its societies, and allow me to say that it is really startling for a European visitor to see the high way in which you are, in the first place, acting in your profession and, in the second place (and that is of course of interest to university men), the high way in which you are handling medical education. We all know in Europe that the American universities, especially the American medical schools—I am now speaking of them—are on a very high plane, and as far as I am aware that is principally due to the great help which the American Medical Association renders the universities and is due to you gentlemen that the American medical schools have reached the high position they have. That is due to the fact that the medical profession sees that all members have a high standard in science and in medical knowledge, and the few moments that I have now been with you show me what high standards you also have as to medical ethics. Medical ethics is just as important for the profession as medical knowledge, and I congratulate the American Medical Association and the leaders who are sitting here on their very high achievements. I ought not to express the wish that your achievements will be still higher because I don't know how you are able to surpass yourselves.

#### Report of Judicial Council

Dr. George Edward Follansbee, Chairman, presented the following report, which was adopted on motion, duly seconded and carried:

Complying with the instructions of the delegates, the Judicial Council reports the following procedure for the installation in absentia of the President-Elect, Dr. J. Tate Mason. The Council recommends that President McLester shall formally and officially declare President-Elect J. Tate Mason duly installed in absentia as President, and designates as a committee representing this House of Delegates to convey to President-Elect Mason and the members of his family at this time the action so taken: Drs. Brien T. King, Delegate from Washington, John H. Fitzgibbon, Delegate from Oregon, John H. O'Shea, member of the Judicial Council, and Ralph A. Fenton, member of the Board of Trustees.

The Council also recommends that this action be entered on the minutes of the Association and that an appropriately embossed copy of that portion of the minutes of the Opening General Meeting of the 1936 Session of the American Medical Association covering the induction into office of the officers of the Association be sent to him through an appropriate person.

#### Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. Frederic E. Sondern, New York, completed the report of the Reference Committee, a portion of which was presented by him at the Tuesday morning session. The report in its entirety follows:

#### REPORT OF BOARD OF TRUSTEES

Your committee can see in the increased length of this report, some ninety-four pages of the Handbook, an added third of material over a year ago, not only the mounting task of your executive body but also its increasing responsibility. The increase in the number of employees from 518 at the end of 1934 to over 550 at the present time is additional evidence of this increasing activity. Few boards conducting activities as great are asked to exercise control in such varied fields, even if advised by experts. The increasing success in every one of

their endeavors proves their competence. While your committee can propose no reward for this increasingly arduous service, we can at least impress on the members of this House the debt we owe these men and the respect which should be theirs for their opinions, on account of their proved efficiency.

*The Journal.*—The fact that the paid circulation of THE JOURNAL for 1935 was larger by 4,344 subscriptions than in the preceding year is evidence of its increasing usefulness and popularity, a direct tribute to its editor, whose other editorial and literary activities very evidently do not detract from this his chief purpose. As the result of his ability and constant high standard, it is without question the most informative and leading publication of its kind in any language.

*Special Journals.*—It is recognized that these journals are equal to the very best published anywhere, and that they render undoubted educational service. While a gain in circulation was achieved, the cost of production over the money return is considerable. Attention should be given to the concern of the Board in the matter of commercially published periodicals in special fields which become the official organs of special societies with compulsory subscriptions. Loyalty to the Association and its interests should prompt the members of such societies to arrange for services in the publications of the Association, a matter which could doubtless be made to serve the best interests of both the society concerned and the Association. Greater publicity concerning the special journals might increase their circulation.

*Hygeia.*—The report indicates that this magazine is serving well the purpose for which it was established. The information that 3,000 subscriptions arranged by the Army Medical Department for the CCC have been promised is noteworthy. While the cost of production was considerably greater than income, it would seem to your committee a legitimate expense in view of what the publication achieves. Its utility for placing before the public the disadvantages of socialized medicine when it may become necessary to mold opinion in this regard would be an additional reason for its being.

It is quite possible for one to query the need of expenditure over income in the matter of Association publications generally and library activities. It must be remembered that academies of medicine and similar organizations throughout the country are judged in effectiveness by their publications and library facilities. The American Medical Association has reached its enviable standard of excellence and position in the interest of scientific medicine, which is recognized the world over, not by its annual meetings, worthy as they are, but by its continually increasing publications in practically every field to enhance medical knowledge, to inform the profession far and wide and to protect the public. All this work has been kept on the highest plane by the careful scrutiny of all material, meticulous supervision and faultless production. Your Editor, Dr. Morris Fishbein, has for years made this his life's work, and the undoubted success attained has in large measure been due to unusual vigilance and ability, for which he richly deserves commendation. All this costs money, lots of money; but, guarded by the Board of Trustees, to what better use in the interest of the public and the profession can money be spent?

*Quarterly Cumulative Index Medicus.*—The report of your Board that this publication is recognized the world over as the most significant publication in its field is generally acknowledged. The statement that its importance increases as other indexes, such as the *Index Catalogue of the Surgeon General's Office*, has become less available, makes the need for it imperative. Its cost in excess of income of \$44,439.84 prompts the suggestion by your committee that efforts could be made to secure a grant from the Carnegie Foundation or similar body in the support of this essential aid in bibliography.

*Building and Equipment.*—Your committee notes with interest and approval the economy and increased efficiency to be obtained as the result of the alterations, improvements and replacements about to be completed.

*Council on Pharmacy and Chemistry.*—It is again apparent how huge the task is which confronts the members of this council, and it is for this reason that the resignation of such busy men as Drs. Bayne-Jones, Blackfan and Du Bois became necessary. There is every evidence of the continued efficiency

of the service, of the greater use of the conclusions by the profession, and of the greater respect of manufacturers, which results in their striving for improved scientific standing. The adoption of a reorganization plan by the Council on Pharmacy and Chemistry in cooperation with the Council on Physical Therapy and the Committee on Foods for a federation of the administrative work of these three groups, and a correlation of overlapping problems, will probably save much time and effort to their mutual advantage.

*Council on Physical Therapy.*—The work accomplished by this council is again an evidence of the sacrifice of time by busy men in the interest of the public and the profession. It is characterized by educational activities in the preparation of articles and a handbook, cooperation with other organizations, arranging curriculums, establishing a registry for qualified technicians, and providing speakers to stress the use of simple physical therapy rather than expensive apparatus, and by investigation and standardization of apparatus and similar activities. Research grants were also awarded. The reorganization previously mentioned will also conserve time and energy in the way described.

*Bureau of Legal Medicine and Legislation.*—This report has been referred to the Reference Committee on Legislation and Public Relations.

*Bureau of Medical Economics.*—This report has likewise been referred to the Reference Committee on Legislation and Public Relations.

*Bureau of Health and Public Instruction.*—It is evident from the report that the expansion in the scope of the work including increased correspondence and activity in the field required the appointment of an assistant director versed in public health education. It has been apparent for some time to those of us interested in radio broadcasting as a method of public health instruction that the ordinary radio talks by representative members of the profession no longer command the interest of the public, which has been increasingly sophisticated by the more attractive presentation of radio broadcasting generally. For this reason your committee commends the effort of this bureau in the substitution of radio dramatizations in the interest of public health, and the success attained. While the major companies in the broadcasting field have as the result of the endeavors of the Bureau improved their rules in the interest of approved public health communications, smaller local stations, existing in large numbers, still sell time to unprincipled speakers on medical topics. While the appeals to the Federal Communications Commission in charge of broadcasting have not eliminated this evil, continued efforts are advised. The more practical supervision of such publicity, also of the press and cinema by organized medicine, where it exists, is most desirable, but unfortunately it does not include the worst offenders, who are not members and consequently not subject to such restrictions.

*Bureau of Investigation.*—Your committee desires to record its appreciation of the services of Dr. Arthur J. Cramp for thirty years, especially as the efficiency of the Bureau became outstanding under his direction. It is a satisfaction to know of its continued able management.

*Bureau of Exhibits.*—The continually increasing effectiveness of the Bureau is another cardinal activity of the Association in furthering scientific medicine. The exhibits at the annual meeting are noteworthy indeed, their educational value is unusual, and they are the envy of and the pattern for similar efforts anywhere.

*Committee on Foods.*—The report of the Committee indicates plainly the stress of work under which it has labored, which in fact necessitated that for a period submission must be restricted. As stated, "it has become more and more evident that the facilities of the office would not permit the amount of policing over advertising of accepted products that such material seems to demand. That claims opposed to the principles of the American Medical Association are promulgated from time to time is only too evident."

Your committee is quite in sympathy with the difficulties encountered and would suggest the indulgence of the membership to allow the Committee on Foods, a relatively new undertaking, to get into the usual completely efficient stride of American Medical Association endeavors.

*Requests for a Special Session of the House of Delegates, Resolution Concerning the Establishment of a National Department of Health, and Resolution Pertaining to Scarlet Fever Patent.*—Your committee supports the conclusions reached by the Board of Trustees in these matters.

*Instruction in Medical Schools Regarding Organized Medicine.*—Your committee endorses the request of the Board of Trustees in presenting the following resolutions for your consideration:

WHEREAS, It has been noted with disappointment that some of the graduates of medical schools and colleges in recent years apparently are unfamiliar with the objectives and activities of organized medicine and lack a clear understanding of the benefits to be derived through membership in local, state and national medical societies; be it

Resolved, By the House of Delegates of the Ohio State Medical Association, Oct. 2-4, 1935, that the administrative officials of all accredited American medical colleges be respectfully requested to provide instruction for senior students on the activities, services and benefits of organized medicine; be it further

Resolved, That a copy of this resolution be transmitted to the dean of each of the accredited medical colleges of America, the Council on Medical Education and Hospitals and the Board of Trustees of the American Medical Association, and the secretary of each constituent state medical society.

*Resolution Pertaining to Pure Food Bill and to Advertising.*—In the language of the Board of Trustees, "Councils, bureaus and departments of the Association have given the utmost possible cooperation to the Food and Drug Administration of the Department of Agriculture and to other governmental agencies concerned with the administration of federal statutes."

It is the opinion of your committee that the Board has given unusually careful attention to the matter concerned and justifies its conclusions which your committee desires to endorse. Relative to the other matters concerning the Pure Food Law, the use of labels or approval of the Committee on Foods, and the acceptance of certain advertising matter by the Association, which have been the subject of correspondence and certain controversy between representatives of the Medical Society of New Jersey and the Board of Trustees, your committee has carefully noted all the material submitted and also obtained additional details from the secretary of the Council on Pharmacy and Chemistry, and from the representatives of the Medical Society of New Jersey.

It is the opinion of your committee that the representations of the Medical Society of New Jersey were made in good faith and only in the interest of the best traditions of the Association. It is likewise the opinion of your committee that the Board of Trustees and the various councils concerned have given meticulous attention to these matters, and that their conclusions are the result of careful, efficient thought, with which your committee is in complete accord.

*Committee on Therapeutic Research and Committee on Scientific Research.*—Your committee is in complete agreement with the numerous grants in support of individual research made by these committees. We view with individual pleasure the support of the man properly qualified to envision an ideal. After all, it has been individual initiative, keen individual competition and the idealistic strife for achievement which is behind not only the success but also the glory of our country. Steam, electricity, telegraph, radio and every modern advance is the result of individual and not collective effort. In these days, when we are threatened with subsidy, to collectivism and bureaucracy, let us continue to emulate the principle of the American pioneer, glad to stand on the basis of his individual effort or to starve on his individual failure.

The ultimate success of our state will not be based on our suckling on her bosom but on the rugged individualism of each stalwart, willing to work such hours needed to accomplish his task with honesty and the fear of God as his maxim.

*Treasurer's Report and Auditor's Report.*—Your committee views with pleasure the figures submitted. The budget is balanced and the reserve in such form as to create the envy of less fortunate and less well managed groups.

*Invitation to the Association to Meet with the Canadian Medical Association in 1939.*—The wisdom of the decision of the Board that it does not seem expedient to have a joint meeting in the near future is quite apparent to your committee, although with regret. In these days of stress and strife between

nations, when closer association of the English speaking peoples is a comfortable thought, to those of us who believe in this harmony, it is suggested that the Association should stimulate its members to visit the annual meeting of the Canadian Medical Association, just as we may hope to have the Canadian Medical Association stimulate the visit of their members to our annual meeting.

#### REPORT OF THE SECRETARY

Your committee cannot pass to this report without contemplation for a moment of the individual. Olin West—who hears or thinks of this name without a feeling of well being?—that genial gentleman, courteous, explicit, kindly and truthful, with but one thought, the interest of our Association. You may mark his grave with a monument, you may decorate his shirt front with a medal. We don't know—but we do know that any commendation that can be put into words, of which we are scarcely capable, this House would rise in acclaim. As a token of our respect and regard, we ask that you do so now!

The Secretary reports with pride a membership of 2,000 in excess of ever before. A Fellowship of over 63,000. He commends the Annual Conference of Secretaries, and the field work of the Association, to which your committee begs to attract your attention.

His comment relative to greater care in the selection and admission of members deserves your attention.

The set of resolutions in his report for your attention has been otherwise introduced. His suggestions relative to membership jurisdiction deserves the earnest consideration of the component state societies and has the endorsement of your committee.

On motions of Dr. Sondern, duly seconded and carried, the report of the reference committee was adopted section by section and as a whole.

#### Report of Reference Committee on Sections and Section Work

Dr. Arthur J. Bedell, Chairman, presented the following supplementary report, which was adopted on motion of Dr. Bedell, seconded by Dr. John Z. Brown Sr., Utah, and carried.

Your committee had before it for consideration a substitute resolution offered by the Judicial Council, covering the original resolution presented by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology.

Your committee recommends the adoption of this substitute resolution.

Respectfully submitted. ARTHUR J. BEDELL, Chairman.  
C. L. CUMMER.  
C. W. ROBERTS.

The House recessed at 5 p. m., to meet at 1 p. m., Thursday, May 14.

### Third Meeting—Thursday Afternoon, May 14

The House of Delegates was called to order at 1:10 p. m. by the Speaker, Dr. N. B. Van Etten.

#### Report of Reference Committee on Credentials

Dr. J. D. Brook, Chairman, reported that Drs. Grant C. Madill and Thomas P. Farmer, regularly elected delegates from New York, were unable to be present; that their regularly elected alternates were not in attendance, and that the president and the executive committee of the council of the Medical Society of the State of New York certified Dr. Newton T. Saxl and Dr. Edwin G. Ramsdell and desired to have them seated. Dr. Brook moved that Drs. Saxl and Ramsdell be seated. The motion was seconded by Dr. J. Newton Hunsberger, Pennsylvania, and carried.

Dr. Brook reported further that there was a total registration of 168 delegates.

#### Roll Call

Dr. Olin West, Secretary, called the roll and announced that more than a quorum of the House had responded.

#### Presentation of Minutes

It was moved by Dr. J. D. Brook, Michigan, seconded and carried, that the minutes be read by title.

Dr. Olin West, Secretary, presented the minutes of the meetings of the House held on Tuesday morning and afternoon,

May 12, and on motion of Dr. Arthur J. Bedell, New York, seconded by Dr. Harold T. Low, Colorado, and carried, the minutes were adopted.

The matter was reconsidered on motion of Dr. L. J. Hirschman, Michigan, seconded and carried.

Dr. Hirschman then moved that the Secretary delete from the minutes of Tuesday, May 12, all debate regarding the installation of the President-Elect. The motion was seconded by Dr. Harold T. Low, Colorado, and carried, after amended to read that when so deleted the minutes be adopted.

#### Report of Board of Trustees

Dr. Rock Sleyster, Chairman, reported that the Committee to Study Contraceptive Practices and Related Problems had been continued and that the Board understood that Dr. Carl H. Davis had consented to serve on it.

#### Report of Reference Committee on Legislation and Public Relations

Dr. R. L. Sensenich, Chairman, presented the following report:

#### REPORT OF COMMITTEE ON LEGISLATIVE ACTIVITIES

The report of the Committee on Legislative Activities was referred to this committee. The report of this committee covering the activities of the past year is obviously too lengthy to be reread at this time. Your committee commends the Committee on Legislative Activities for its continued efforts throughout a very comprehensive field during the past year. There are some points in the report which your reference committee believes may properly be developed to a somewhat broader view and should especially be emphasized.

The report of the Committee on Legislative Activities in referring to the adequacy of medical service rendered in rural communities and charges for such services on a mileage fee basis states as follows: "The subject of fees based on mileage requires further study. We believe there are inequalities due to conditions involving time and cost of transportation. It is recommended that each state and county society study this problem in its respective area in order that readjustments may be made that will relieve the profession as a whole from the implications of unfair charges in the rural districts." Your committee recommends that the Bureau of Medical Economics of the American Medical Association be requested to prepare a brief statement based on the information obtained from the survey and studies now being conducted, this information to be forwarded to the secretaries of the constituent associations in such form that it may be printed in state journals, or that if desired a sufficient number of copies be supplied so that they may be distributed to the component county societies.

The following statement from the report of the Committee on Legislative Activities, your committee deems worthy of further consideration:

"Sickness insurance has been thoroughly discussed. Plans for the distribution of medical care to low income groups are being tried by various county societies. Large industrial interests have approached physicians and county medical societies with plans for the medical care of their employees.

"Your Committee on Legislative Activities calls to the attention of the delegates, and through them to the attention of all constituent associations and component societies, the fact that the attitude and decision of the profession on this question are of utmost importance. It may readily be seen that the profession will lose its continuity of thought and action if its members vary from the principles which have been laid down to guide those active in bringing about contractual relations with any group."

Your reference committee points to the fact that, in contracts between physicians or organized medical groups and employers or groups of employees, the qualification of those eligible for medical service under the contract is based on the source of their employment rather than the amount of their incomes. In this respect such contracts must not be confused with the various experimental plans for the relief of low-income groups, which have been defined and within certain limits approved for the purpose of study. Financial concession to members of certain groups, solely because they are employed by the same

employer, regardless of whether the service is to be paid for by the employer or the employee, establishes a pattern for which there is not the same justification as that in which eligibility rests on an income basis. The consideration of such contracts is not an emergency matter.

Prudence suggests the avoidance of possible bad effects rather than dependence on judicial appeal after unwise action has been taken.

Your reference committee therefore recommends that before any such contracts are entered into they should be submitted to the state medical association having jurisdiction, for approval or disapproval. The reasons on which is based the request for approval in establishing such a contract should be stated. Evidence should also be presented that the provisions of the contract would not operate in violation of restrictions on such practice as has been defined by the Judicial Council and action of the House of Delegates.

Information concerning the acts and policies of local units of organized medicine travels rapidly and the enthusiasm of the moment frequently encourages similar action in other units before sufficient time for dependable trial has elapsed. Mutual interests and objectives which underlie the relations existing between the constituent associations should impose the obligation that, before approval is given to a program which must obviously reflect on the interests of other states, the state considering such approval should transmit the information on which it is basing its judgment to the other constituent state associations and to the American Medical Association.

The following refers to the administration of the Social Security Act in the respective states: "If the medical society of the state shows no interest, or is unable to secure satisfactory state organization for the administration of the act, the Bureau representatives in Washington are unable to particularize sufficiently to solve medical problems which obviously must be handled locally. These questions deserve our most careful consideration. We must cooperate to develop plans which will preserve all the rights of the private practice of medicine."

Your reference committee wishes to emphasize the importance of this matter and to point out that the component county medical societies must be equally informed and active, as is the organization of the constituent state associations, for it is the members of the county society who will be concerned at the ultimate point of contact between the administration of the Social Security Act and the public, and it is here that the weaknesses and abuses will be first evident.

Delegates and secretaries of state societies should take the message from this meeting to their component societies. Something might also be gained by discussion of the operation under the various types of administration of this act before the Conference of State Secretaries in Chicago.

#### RESOLUTION ON APPOINTMENT OF COMMITTEE TO STUDY PROBLEMS OF MOTOR VEHICLE ACCIDENTS

Your reference committee gave consideration to the resolution which provides for the appointment of a committee of five to be appointed by the President to survey and study the problems of motor vehicle accidents and injuries therefrom. The resolution also directed the appropriation of sufficient amount to cover the necessary expenses. The House of Delegates has taken action with reference to the physical fitness of automobile drivers. Your committee is also of the impression that much of the information desired may be obtained from studies made by other bodies, and that information would be available to the American Medical Association. As the resolution directs the appropriation of money to finance the proposed study, it passes from the jurisdiction of the House of Delegates to the Board of Trustees. Your committee, therefore, recommends that the resolution be referred to the Board of Trustees for such action as it may deem wise.

#### CONSIDERATION OF SENATE BILL 4516

Your committee had before it Senate Bill 4516, introduced into the Seventy-Fourth Congress by Mr. Robinson, to provide subsidies for the erection and operation of tuberculosis hospitals. After a hearing of interested parties by the committee, Dr. Horace Reed, Oklahoma, who had presented the bill to

the House, requested permission to withdraw it, and your reference committee recommends that such permission be given, without action by the reference committee.

Respectfully submitted.

A. C. MORGAN.

C. J. WHALEN.

R. L. SENSENICH, Chairman.

J. H. IRWIN.

E. N. ROBERTS.

The report of the reference committee was adopted section by section and as a whole, on motions of Dr. Sensenich, duly seconded and carried.

#### Report of Reference Committee on Hygiene and Public Health

Dr. W. F. Draper, Chairman, presented the following report:

##### RESOLUTIONS ON CONTROL OF OCCUPATIONAL DISEASES

After careful consideration, the committee is of the opinion that while the resolution, as introduced by Dr. A. R. McComas, Missouri, was of value, the meaning might be clarified and the purpose better served if it were presented in a different form. After conference and agreement, therefore, with the sponsors of the resolution, the committee desires to present the following substitute resolutions and to recommend their adoption:

WHEREAS, In recent years there has developed an increase in recognition of the seriousness of diseases arising from conditions to which workers are exposed from certain occupations; and

WHEREAS, The diagnosis of such diseases is possible only by physicians, and the correction of such conditions as would tend to eliminate the hazards can best be carried out under the guidance and administration of physicians, particularly physicians trained and experienced in industrial hygiene or public health; therefore be it

Resolved, That it be deemed essential that any active efforts by governmental agencies to study and to take measures tending to eliminate occupational diseases should be carried out under the supervision of the city, state or federal departments of health in this country and that this Association do all within its power to assist in this endeavor; and be it further

Resolved, That the Board of Trustees of this Association continue and enlarge its study of industrial hygiene, occupational diseases, and particularly silicosis, to the end that uniform legislation be put into effect in all the states to control these conditions.

#### COOPERATION WITH UNITED STATES CONSTITUTION SESQUICENTENNIAL COMMISSION

The Reference Committee on Hygiene and Public Health has given careful consideration to the program of observance of the one hundred and fiftieth anniversary celebration of the formation of the constitution of the United States and recommends that the House of Delegates give its endorsement and moral support to the purposes served by the United States Constitution Sesquicentennial Commission established by the Congress of the United States.

#### RESOLUTIONS ON PROPOSED LEGISLATION DEALING WITH HELIUM

According to the sources of information available to the committee at the present time, the passage of the proposed legislation is desirable from the medical standpoint. The committee therefore recommends the adoption of these resolutions.

Respectfully submitted.

WARREN F. DRAPER, Chairman.

J. NEWTON HUNSBERGER. HENRY C. MACATEE.

FELIX J. UNDERWOOD. GUY W. WELLS.

On motions of Dr. Draper, duly seconded and carried, the report of the reference committee was adopted section by section and as a whole.

#### Report of Reference Committee on Amendments to Constitution and By-Laws

Dr. John W. Ames, Chairman, presented the following report:

##### PROPOSED AMENDMENT TO BY-LAWS, CHAPTER V, SECTION 1, AND CHAPTER IX, SECTION 1

Your committee approves the following amendments:

Amend Chapter V, Section 1, fourth sentence, to read "With the approval of the Board of Trustees he is authorized to appoint committees, (a) requested by the Councils and (b) for emergencies not otherwise provided for."

Amend Chapter IX, Section 1, second power invested in the Judicial Council, to read "(2) all controversies arising under this Constitution and By-Laws and under the Principles of Medical Ethics to which the American Medical Association is a party."

The first paragraph of Section 1, Chapter IX, will then read: THE JUDICIAL COUNCIL.—The judicial power of the Association shall be vested in the Judicial Council, whose decision shall be final. This power shall extend to and include (1) all questions involving Fellowship in the Scientific Assembly or the obligations, rights and privileges of Fellowship; (2) all controversies arising under this Constitution and By-Laws and under the Principles of Medical Ethics to which the American Medical Association is a party; and (3) controversies (a) between two or more recognized constituent associations, (b) between a constituent association and a component society or societies of another constituent association or associations or a member or members of another constituent association or other constituent associations, and (c) between members of different constituent associations. In all these cases the Judicial Council shall have original jurisdiction.

Add the following paragraph to Chapter IX, Section 1: "The Judicial Council shall have authority in its discretion from time to time to request the President to appoint investigating juries to which it may refer complaints or evidence of unethical conduct which in its judgment are of greater than local concern. Such investigating juries, if probable cause for action be shown, shall report with formal charges to the President who, under Chapter V, Section 1, of the By-Laws, shall appoint a Prosecutor who, in the name and on the behalf of the American Medical Association, shall prosecute the charges against the accused before the Judicial Council. The Council shall have the power to acquit, admonish, suspend or expel the accused."

#### PROPOSED AMENDMENT TO BY-LAWS, CHAPTER XI, SECTION 1

An amendment to Article 8, Section 1, of the Constitution was presented to your committee. After careful consideration and in conference with the Judicial Council it was deemed advisable to incorporate the amendment in the By-Laws, Chapter XI, Section 1. As this amendment originated with the Judicial Council, your committee feels that this change will be entirely satisfactory to the House. Your committee therefore suggests the following amendment to Chapter XI, Section 1, first sentence: "Membership in this Association shall continue only so long as the individual is a member of a component society of the constituent association through which he holds membership and who is not now serving, or within twelve months has not served, a sentence for felony."

#### RESOLUTION PROVIDING FOR FITTING RECOGNITION TO FELLOWS RENDERING DISTINGUISHED SERVICE IN SCIENCE OF MEDICINE

Your committee recommends the approval of the resolution, and the recommendations continued therein, on the appointment of a Committee to Propose an Amendment to the By-Laws Providing for Fitting Recognition to Fellows Rendering Distinguished Service in Science of Medicine, which was presented by Dr. H. H. Shoulders, Tennessee.

#### PROPOSED AMENDMENT TO BY-LAWS, CHAPTER XIV, SECTION 13

Your committee considered the following portion of the report of the Reference Committee on Sections and Section Work, which had been referred to it:

"In closing this report, your committee, prompted by a desire to make possible a contribution to future programs, offers the following suggestions:

"In spite of the implication in Section 13, Chapter XIV, of the Constitution and By-Laws which reads as follows 'A Fellow shall present no more than one paper at any Scientific Assembly,' a perusal of the program reveals occasional instances of repetition in the designation of one man to lead in the discussion of papers. Your committee believes this to be a violation of the spirit of the foregoing section which was evidently intended to enable the Council on Scientific Assembly to give the largest possible number of our members opportunity for

appearance on the program. Your committee recommends that this section of the By-Laws be amended so as to preclude a continuance of this practice."

Your committee, while not wishing to restrict helpful discussion of papers, is of the opinion that this principle should be adhered to in the matter of opening discussions on papers, and approves the recommendation. The amended section should therefore read as follows: A Fellow shall present no more than one paper at any Scientific Assembly nor shall any Fellow open the discussion on more than one paper at any Scientific Assembly.

Respectfully submitted. JOHN W. AMESSE, Chairman.

CHARLES S. SKAGGS. JOHN F. HAGERTY.  
S. P. MENGEL. WELLS TEACHNOR SR.

On motions of Dr. Amesse, duly seconded and carried, the report of the reference committee was adopted section by section and as a whole.

#### Report of Reference Committee on Medical Education

Dr. George Blumer, Chairman, presented the following report:

#### RESOLUTION REQUESTING THAT STATE ASSOCIATION BE NOTIFIED WHEN HOSPITAL IS THREATENED WITH REMOVAL FROM ACCREDITED LIST

Your committee approves of the following substitute resolution, which was agreed on after conference with the members of the Colorado State Medical Society concerned in the introduction of the resolution, and recommends its adoption:

*Resolved*, By the House of Delegates of the American Medical Association, that the Council on Medical Education and Hospitals, in all actions concerning the rating of hospitals having to do with the appointment of interns and residents, shall, when a hospital is threatened with removal from the accredited list, permit such hospital to seek the advice and assistance of the authorities of the state medical society.

#### RESOLUTIONS CONCERNING GRADUATES OF MEDICAL SCHOOLS OF FOREIGN COUNTRIES

Your committee approves of the resolutions relating to graduates of medical schools of foreign countries, which were introduced by Dr. William R. Molony Sr., California, and recommends their adoption.

Respectfully submitted.

GEORGE BLUMER, Chairman.  
J. GURNEY TAYLOR.  
J. F. SILER.  
C. A. DUKES.

The report of the reference committee was adopted section by section and as a whole, on motions of Dr. Blumer, duly seconded and carried.

#### Report of Judicial Council

Dr. George Edward Follansbee, Chairman, presented the following report, which was adopted on motion duly seconded and carried:

The Judicial Council is of the opinion that most, if not all, of the directories, described in the resolution condemning as unethical the listing of physicians by specialty in directories published by commercial concerns which were introduced by Dr. William R. Brooksher, Arkansas, are but subtle ways of avoiding the pronouncement of the Principles of Medical Ethics concerning solicitation of patients, under a guise of buying a directory when the real intent is the purchase of the publication of the buyer's name in the directory for the purpose of obtaining patients.

The Judicial Council approves the resolutions and recommends their adoption.

#### Report from Section on Practice of Medicine

Dr. J. E. Paullin, Section on Practice of Medicine, presented the following report from the section:

At a business meeting of the Section on Practice of Medicine at the Kansas City session of the American Medical Association, held Wednesday, May 13, 1936, a motion was unanimously carried approving the formation of an American board of internal medicine.

Dr. Paullin moved that this action of the Section on Practice of Medicine be approved. The motion was seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried.

#### Report of Reference Committee on Reports of Officers

Dr. E. H. Cary, Chairman, presented the following report: The supplementary report of the Judicial Council has come to the Reference Committee on Reports of Officers. Your committee is reminded of the loss of two of our distinguished fellow physicians through the deaths of Dr. Edwin P. Sloan on Sept. 13, 1935, and Dr. Emmett North on Dec. 27, 1935. These gentlemen were not only members of the Judicial Council but had served faithfully in this House for a great many years. Your committee recommends that the House of Delegates extend its deepest sympathy to the family of each of these servants of the people and the profession of medicine.

Regarding the continued membership in this Association of certain members of county medical societies who have been convicted of felonies and some of whom have served a sentence for felonious acts, your committee suggests that this be brought more forcibly to the attention of the constituent state associations and, through them, to the attention of the component medical societies, that action may be had to eliminate such individuals from their membership so that the American Medical Directory will cease to carry the names of such individuals. The committee recommends that the Council, if it finds it needed, write a suitable amendment to the Constitution and By-Laws, which may be brought to the attention of the House for its approval.

Regarding the extension of original jurisdiction in matters of discipline to the national organization, the Judicial Council suggested in a previous report that it should have the duties and powers now conferred on it, but it should not at any time be placed in an ex parte position. The reference committee at the last session suggested that the Council "submit such amendments to the Constitution and By-Laws of the Association as are necessary to secure the purposes sought." The Judicial Council states that it has found such revision comparatively simple and will submit such amendment at the proper time, and your committee recommends that the House act favorably on the amendment when presented.

Your committee wishes to approve the acts of the Council in its cooperation with the Section on Laryngology, Otology and Rhinology in drawing a resolution to meet the issue raised by members of that section regarding the acceptance of commissions in the purchase of audiometers, as well as suggesting the proper use of such instruments for measuring the acuity of hearing.

Respectfully submitted.

E. R. CUNIFFE

E. A. HINES.

E. H. CARY, Chairman

W. R. BROOKSHER.

WILLIAM ELLINGWOOD

On motions of Dr. Cary, duly seconded and carried, the report of the reference committee was adopted section by section and as a whole.

#### Resolution on Teaching of and Consultation with Optometrists, from Section on Ophthalmology

Dr. Emory Hill, Section on Ophthalmology, presented the following resolution, which on motion of Dr. Hill, seconded and carried, was adopted:

WHEREAS, At the 1934 session of the American Medical Association, a resolution emanating from this section was approved by the House of Delegates, whereby we registered our disapproval of the employment of optometrists by hospitals; and

WHEREAS, At the Atlantic City session of this section we presented resolutions to the House of Delegates of the American Medical Association, which in substance stated that we were opposed to the association of our members and those of the optical trade, and

WHEREAS, These resolutions were adopted by the House of Delegates, and

WHEREAS, There are attempts to force some ophthalmologists to instruct students of optometry; and

WHEREAS, We believe this unwise, unethical and inadvisable, therefore be it

Resolved, That we, the Section on Ophthalmology, instruct our Delegates to the House of Delegates to present this resolution as an expression of our views with the hope that this action will be officially approved and given wide publicity through the pages of THE JOURNAL.

#### Resolution on Advertising of Drugs and on Establishment of Section on Anesthesia, from the Section on Pharmacology and Therapeutics

Dr. N. M. Keith, Section on Pharmacology and Therapeutics, presented the following resolutions from that section:

At the meeting of the Section on Pharmacology and Therapeutics held Wednesday, May 13, 1936, the following resolutions, approved by the executive committee of the section, were unanimously passed by the section, for submission to the House of Delegates:

1. The section requests the House of Delegates respectfully to petition Congress to apply to the advertising of drugs the same regulations that apply to the labeling of original packages of drugs or drug products.

2. The section respectfully requests the House of Delegates to consider favorably the establishment of a Section on Anesthesia, with the understanding that such a section should not be in association with the Section on Pharmacology and Therapeutics.

CHAUNCEY D. LEAKE, Chairman.

RUSSELL HADEN, Secretary.

Dr. Keith moved that these resolutions be adopted. The motion was seconded by Dr. W. F. Braasch, Minnesota, and was lost.

Dr. G. Henry Mundt moved to reconsider, and the motion was seconded by Dr. Walter E. Vest, West Virginia, and carried.

Dr. Keith moved the adoption of the resolution referring to advertising of drugs. The motion was seconded by Dr. G. Henry Mundt, Illinois, and carried.

Dr. Keith moved that the resolution on the establishment of a Section on Anesthesia be adopted. Since this is a responsibility of the Council on Scientific Assembly, the resolution was referred to that body.

#### Resolution on Survey of Public Mental Hospital Services in the United States, from Section on Nervous and Mental Diseases

Dr. Tom B. Throckmorton, Section on Nervous and Mental Diseases, presented the following resolution, which was adopted on motion of Dr. Throckmorton, seconded by Dr. J. Allen Jackson, Pennsylvania, and carried:

WHEREAS, There is need for a wider and more equal distribution of facilities for the care and treatment of the mentally ill, and

WHEREAS, The standards of such care may be improved through the collection and study of data pertaining to mental hospital services in the United States; and

WHEREAS, The measures and facilities for training personnel in nervous and mental disease are of very great importance in bringing about improved standards, and

WHEREAS, A joint cooperative committee has been organized for the conduct of a national survey of Mental Hospital Services; and

WHEREAS, That committee has invited the section on Nervous and Mental Diseases of the American Medical Association to designate two representatives of that section to serve with the committee, therefore be it

Resolved, That the House of Delegates of the American Medical Association approves the designation of two members of the Section on Nervous and Mental Diseases to serve as members of the Cooperative Committee for the Survey of Public Mental Hospital Services in the United States

#### Resolutions on Federal Aid to Hospitals

On motion of Dr. E. H. Cary, Texas, seconded and carried, the unanimous consent of the House was given for the introduction of the following resolutions submitted by Dr. McLain Rogers, Oklahoma.

WHEREAS, It has been reported to the House of Delegates that plans are about to be consummated for the loan of federal money to individuals to enable them to subscribe for stock in an existing cooperative hospital at Elk City, Okla., and

WHEREAS, The hospital referred to is not operated in accordance with the Principles of Medical Ethics of the American Medical Association or in conformity with the special rules of the association governing hospitals and is managed by a physician who has been expelled from his county medical association, and

WHEREAS, The reported plan for federal aid for this or any other hospital similarly situated, whether given directly or indirectly, under the guise of gifts or loans to individual stockholders or prospective stockholders, is contrary to public policy and to the interests of the medical profession, be it

Resolved, That the Board of Trustees be requested to investigate the existing situation immediately, not only with respect to the reported situation in Elk City, Okla., but also with respect to the general policies

of the federal government and to take such action as it deems proper to protect the interests of the public and of the medical profession; and be it further

*Resolved*, That if the Trustees think it wise, a copy of these resolutions be transmitted to the President, the President of the Senate, the Speaker of the House of Representatives, the Director of the Budget, and the Undersecretary of Agriculture in charge of the Rural Resettlement Administration.

The resolutions were adopted on motion of Dr. Rogers, seconded by Dr. Samuel J. Kopetzky, New York, and carried.

### ELECTION OF OFFICERS

Dr. Olin West, Secretary, on request of the Speaker, read Sections 1 and 3, Chapter IV, of the By-Laws referring to nominations.

#### Election of President-Elect

Dr. Charles B. Reed, Illinois, nominated for President-Elect Dr. Charles E. Humiston, Chicago.

Dr. William Weston, Section on Pediatrics, nominated Dr. Isaac A. Abt, Chicago.

Dr. John F. Hagerty, New Jersey, nominated Dr. Wells P. Eagleton, Newark, N. J., and the nomination was supported by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology.

Dr. C. W. Stone, Ohio, nominated Dr. J. H. J. Upham, Columbus, Ohio.

The Speaker declared the nominations, which had been supported by several delegates, closed, and appointed as tellers Drs. J. W. Burns, Texas; C. E. Wagner, Delaware; C. G. Abell, Vermont; J. F. Smith, Wisconsin, and R. W. Fauts, Nebraska.

The Secretary announced that 163 delegates had been recorded as present and that 163 votes had been cast, of which Dr. Charles E. Humiston received 29; Dr. Isaac A. Abt, 53; Dr. Wells P. Eagleton, 9, and Dr. J. H. J. Upham, 72.

The Speaker declared that as no candidate had received a majority vote, a second ballot would be taken, eliminating the name of the one having received the least number of votes, Dr. Wells P. Eagleton.

Dr. Charles B. Reed, Illinois, withdrew the name of Dr. Charles E. Humiston.

A second ballot was taken and the Secretary announced that 163 delegates had recorded their presence and that 161 votes had been cast, of which Dr. Isaac A. Abt received 58 and Dr. J. H. J. Upham 103.

The Speaker declared Dr. J. H. J. Upham, having received the majority of the votes cast, elected President-Elect of the American Medical Association.

#### Election of Vice President

Dr. Frederic E. Sondern, New York, nominated for Vice President Dr. Charles Gordon Heyd, New York.

Dr. Charles B. Reed, Illinois, nominated Dr. Charles E. Humiston, Chicago.

Dr. L. J. Hirschman, Michigan, nominated Dr. Isaac A. Abt, Chicago. Dr. A. A. Walker, Alabama, withdrew the nomination on behalf of Dr. Abt with the consent of the nominator.

On motion of Dr. J. T. Christison, Minnesota, seconded by Dr. Newton T. Saxl, New York, and carried, the nominations were closed.

The Secretary announced that 163 delegates had been recorded as present and that 160 votes had been cast, of which Dr. Charles Gordon Heyd received 104 and Dr. Charles E. Humiston 56.

The Speaker declared Dr. Charles Gordon Heyd, having received the majority of the votes cast, elected Vice President of the American Medical Association.

The vote for Dr. Heyd was made unanimous on request of Dr. Charles B. Reed, Illinois.

#### Address of President-Elect J. H. J. Upham

The Speaker presented the President-Elect, Dr. J. H. J. Upham, Columbus, Ohio, who addressed the House as follows:

*Mr. Speaker, Members of the House:*

I can only very feebly express to you my very deep appreciation of this great honor. When I remember the long list of distinguished leaders of our profession who have filled this

position, and having freshly in mind the splendid record that has just been made by our retiring President, I cannot help but say that I feel the responsibilities of this great office and face them with considerable diffidence.

After more than twenty-five years of close association with this House, as a member and on the Board of Trustees, I have a deep respect and admiration for your calm, deliberative judgment, for your devotion to the high traditions of the medical profession, and your firm determination to support the policy of the individualistic practice of medicine.

It is from that long association with you all that I feel this is just a call to further service for you and with you for the support of the unceasing struggle for the defense of the health of the public, for the progressive advance of the science of medicine, and for the maintenance of the highest type of ethical medical practice.

It is with these ends in view that I pledge you my very best and most sincere efforts.

#### Address of Vice President Charles Gordon Heyd

The Speaker presented the Vice President, Dr. Charles Gordon Heyd, who addressed the House as follows:

*Mr. Speaker, Members of the House of Delegates:*

This entire meeting has been surcharged with emotion. For me to thank you would only be to offer some felicity of expression. Rather should I rededicate myself and make a pledge to you. I wish at this time to bring the laurel of remembrance to the man who is not present here today. In the next few months the people of this country will have to decide a momentous political issue, and in the next few years you gentlemen will have to decide equally momentous issues for the profession of medicine, and I here affirm that I shall give the best of my strength, of my heart, and of my mind to carry out the injunctions that you lay down for me.

#### Election of Secretary

Dr. A. A. Walker, Alabama, nominated Dr. Olin West, Chicago, to succeed himself as Secretary of the American Medical Association. The nominations were closed on motion of Dr. Horace Reed, Oklahoma, seconded and carried.

It was moved by Dr. George W. Kosmak, New York, seconded by Dr. Horace Reed, Oklahoma, and carried, that the rules be suspended so that one vote be cast for Dr. West.

The Speaker cast the ballot of the House for Dr. Olin West as Secretary of the American Medical Association and declared him elected Secretary for the ensuing year.

#### Election of Treasurer

Dr. Rock Sleyster, Chairman of the Board of Trustees, stated that the Board of Trustees nominated Dr. Herman L. Kretschmer, Chicago, as Treasurer. The nomination was seconded by Dr. Harold T. Low, Colorado, and approved by the House.

Dr. Harold T. Low, Colorado, moved that the Secretary be instructed to cast the ballot of the House of Delegates for Dr. Herman L. Kretschmer, Chicago, as Treasurer. The motion was seconded by Dr. George W. Kosmak, New York, and carried. The Secretary cast the vote of the House for Dr. Herman L. Kretschmer, Chicago, as Treasurer, and the Speaker declared Dr. Kretschmer so elected.

#### Election of Speaker of the House of Delegates

The Vice Speaker, Dr. H. H. Shoulders, took the chair and announced that the next order of business was the election of a Speaker of the House of Delegates.

Dr. Floyd S. Winslow, New York, nominated for Speaker Dr. N. B. Van Etten, New York. The nomination was seconded by Dr. Newton T. Saxl, New York, and Dr. William H. Myers, Georgia.

The nominations were closed on motion of Dr. J. W. Burns, Texas, seconded by Dr. Burt R. Shurly, Section on Laryngology, Otology and Rhinology, and carried.

On motion of Dr. J. W. Burns, Texas, seconded by Dr. George W. Kosmak, New York, and carried, the Secretary cast the ballot of the House for Dr. N. B. Van Etten, New York, as Speaker of the House of Delegates. The Vice Speaker declared Dr. N. B. Van Etten duly elected Speaker of the House of Delegates.

**Election of Vice Speaker of the House of Delegates**

The Speaker, Dr. N. B. Van Etten, resumed the chair and declared the next order of business to be the election of a Vice Speaker of the House of Delegates.

Dr. H. B. Everett, Tennessee, nominated for Vice Speaker Dr. H. H. Shoulders, and the nomination was supported by Dr. Samuel J. Kopetzky, New York, and Dr. William H. Myers, Georgia.

On motion of Dr. George W. Kosmak, New York, seconded by several delegates and carried, the nominations were closed.

Dr. H. B. Everett, Tennessee, moved that the Secretary cast the vote of the House for Dr. H. H. Shoulders as Vice Speaker of the House. The motion was seconded by several delegates and carried. The Secretary cast the ballot of the House of Delegates for Dr. H. H. Shoulders, Nashville, Tenn., as Vice Speaker of the House of Delegates, and the Speaker declared Dr. Shoulders elected Vice Speaker.

**Election of Trustee**

The Speaker declared the next order of business to be the election of a Trustee for a term of five years to succeed Dr. Thomas S. Cullen, whose term expired this year.

Dr. William Weston, Section on Pediatrics, nominated Dr. Thomas S. Cullen, Baltimore, to succeed himself as Trustee, and the nomination was supported by Dr. Harvey B. Stone, Maryland.

The nominations were closed on motion of Dr. Frederic E. Sondern, New York, seconded by several delegates and carried, and the Secretary was instructed to cast the vote of the House for Dr. Thomas S. Cullen, Baltimore, as Trustee, on motion of Dr. H. B. Everett, Tennessee, seconded by several delegates and carried.

The Secretary cast the ballot of the House for Dr. Thomas S. Cullen as Trustee for a term of five years, and the Speaker declared Dr. Cullen elected Trustee.

**Nominations for Standing Committees**

Dr. Olin West, Secretary, stated that he had a telegram signed by Dr. J. Tate Mason, President, in which Dr. Mason submitted the following nominations to the House of Delegates:

Judicial Council: Dr. Walter F. Donaldson, Pittsburgh, to succeed himself for a term ending in 1941; Dr. Lloyd Noland, Fairfield, Ala., to succeed Dr. Edward P. Sloan, deceased, for a term ending in 1937, and Dr. Edward R. Cunniffe, New York, to succeed Dr. Emmett P. North, deceased, for a term ending in 1939.

Council on Medical Education and Hospitals: Dr. Fred W. Rankin, Lexington, Ky., to succeed Dr. M. W. Ireland, for a term ending in 1943.

Council on Scientific Assembly: Dr. J. C. Flippin, University, Va., to succeed Dr. Cyrus C. Sturgis, for a term ending in 1941.

On motion of Dr. Brien T. King, Washington, seconded by Dr. J. Newton Hunsberger, Pennsylvania, and carried, the nominations were confirmed.

**Election of Affiliate and Associate Fellows****APPLICANTS FOR AFFILIATE FELLOWSHIP APPROVED BY THE  
COUNCIL ON SCIENTIFIC ASSEMBLY**

Chenoweth, Lincoln C., Joplin, Mo.  
Dunlop, H. E., Brooklyn.  
Fleming, Walter S., Mt. Vernon, N. Y.  
Hocking, George, Baltimore.  
Jerowitz, Herman D., Kansas City, Mo.  
Jolly, W. J., Oklahoma City.  
Lewis, Andrew L., Sumner, Mo.  
McCreery, Forbes R., New York.  
Melvin, J. Tracy, Porterville, Calif.  
Miller, Samuel H., Joplin, Mo.  
Oyen, A. B., Chicago.  
Runyon, Emily C., Richmond, Va.  
Schorer, Cornelia B. J., Foxboro, Mass.  
Sweemer, William, Milwaukee.  
Veckl, Victor, San Francisco.  
Winslow, Randolph, Baltimore.

**APPLICANTS FOR ASSOCIATE FELLOWSHIP FROM AMERICAN  
MEDICAL MISSIONARIES APPROVED BY THE  
JUDICIAL COUNCIL**

Beusfield, Cyril E., Chaoyang, China.  
Davies, Gwilym, Ebolowa, Cameroun, West Africa.  
Dunning, Norma P., Kalkapur, India.  
Herring, James H., Yeung Kong, South China.

Judd, Walter Henry, Fenchow, Shansi, China.  
Lyman, Richard S., Peiping, China.  
Newman, Frank W., Peiping, China.  
Thaeler, Arthur D. Jr., Bilwas Karma, Nicaragua, C. A.

**APPLICANTS FOR ASSOCIATE FELLOWSHIP NOMINATED BY  
THE SECTIONS INDICATED****LARYNGOLOGY, OTOTOLOGY AND RHINOLOGY**

Braun, Herman, Irvington, N. J.

**PHARMACOLOGY AND THERAPEUTICS**

Shoemaker, Harold A., Oklahoma City.

**PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH**

Gordon, J. E., Bucharest, Rumania.  
Grubb, Thomas C., Springfield, Ill.

On motion of Dr. Frederic E. Sondern, New York, seconded by Dr. James E. Paullin, Section on Practice of Medicine, and carried, the nominations were approved and the nominees declared elected Affiliate or Associate Fellows as indicated.

**Place of 1937 Annual Session**

The Speaker announced that the next order of business was the selection of the 1937 annual session and called on the Board of Trustees for nominations.

Dr. Rock Sleyster, Chairman of the Board of Trustees, presented the following report:

Mr. Speaker, invitations meeting the requirements of the Constitution and By-Laws have been received from Cincinnati, Philadelphia and Atlantic City. The facilities of these cities have been investigated by the Board, and the Board reports that those of Philadelphia and Atlantic City are adequate.

The Speaker declared that Philadelphia and Atlantic City nominations were in order.

Dr. Arthur C. Morgan, Pennsylvania, extended an invitation from the medical profession in Philadelphia and in Pennsylvania to have the American Medical Association meet in that city in 1937.

Dr. Walt P. Conaway, New Jersey, extended an invitation from the medical profession of Atlantic City and of New Jersey to have the Association meet in that city in 1937.

The nominations of Philadelphia and Atlantic City were seconded by numerous delegates.

The Speaker requested that the ballot be spread, and the Secretary announced that 163 delegates had been recorded as present and that 139 votes had been cast, of which Philadelphia received 69 and Atlantic City, N. J., 70.

The Speaker declared that the House of Delegates had selected Atlantic City, N. J., for its 1937 session.

**Message of Sympathy**

On motion of Dr. H. A. Luce, Michigan, seconded by Dr. C. S. Gorsline, Michigan, and carried, the House of Delegates extended, through the Secretary, to Dr. R. G. Leland, Director of the Bureau of Medical Economics, its sympathy and its well wishes for his speedy recovery.

**Vote of Appreciation**

Dr. J. W. Burns, Texas, moved that the House of Delegates extend its most hearty appreciation to the local medical profession, to the press, to the citizens, and to every one who had contributed so much to the comfort and entertainment of the Association during the annual session in Kansas City. The motion was seconded by Dr. A. A. Ross, Texas, and carried.

**Greetings to Dr. G. H. Simmons and Dr. Irvin Abell**

The Secretary, Dr. Olin West, announced that he had received word from Dr. G. H. Simmons, Editor and General Manager Emeritus of the Association, expressing his regret at his inability to attend the Kansas City session. The Secretary also announced that Dr. Irvin Abell, a member of the House of Delegates, and Chairman of the Council on Scientific Assembly, was unable to be present because of illness.

On motion of Dr. Arthur J. Bedell, New York, seconded by Dr. H. B. Everett, Tennessee, and carried, the Secretary was instructed to send words of greeting and good wishes to Dr. G. H. Simmons and to Dr. Irvin Abell.

The House of Delegates adjourned sine die at 4:30 p. m.

(To be continued)

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION, PUBLIC HEALTH, ETC.)

### ALABAMA

**Personal.**—Dr. Thurston D. Rivers has been appointed medical director of the Montgomery Tuberculosis Sanatorium, Montgomery, succeeding Dr. Beverly Woodfin Cobbs, resigned.

**State Medical Election.**—Dr. Lloyd Noland, Fairfield, was chosen president of the Medical Association of Alabama at the recent annual meeting. Birmingham was designated as the place for the next annual meeting, April 20-22.

### ARIZONA

**State Medical Election.**—Dr. Chester R. Swackhamer, Superior, was chosen president-elect of the Arizona State Medical Association at the annual meeting in Nogales, recently, and Dr. Jesse D. Hamer, Phoenix, was installed as president. Yuma was designated as the place for the next annual meeting, in April 1937.

**Public Health Meeting.**—The Arizona Public Health Association held its ninth annual meeting in Tucson, April 20-22. Speakers included:

- Dr. Frederick T. Foard, San Francisco, Social Security Act.
- Dr. Edith P. Sappington, San Francisco, Maternity and Infant Work in Arizona.
- Dr. Charles A. Donahdson, Tucson, Silicosis and Tuberculosis.
- Homer N. Calver, New York, Control of Scarlet Fever.
- Dr. William R. Leverton, Tucson, Significance of Heart Murmur in School Children.
- Dr. Charles A. Thomas, Tucson, Tuberculosis in Childhood.

The annual dinner was held Tuesday evening. David B. Treat, health department, Phoenix Union High School, Phoenix, was the speaker; his subject was entitled "Public Health in Relation to Secondary Schools."

### CALIFORNIA

**Dr. Meyer Honored.**—The honorary degree of doctor of medicine was conferred on Karl F. Meyer, Ph.D., director of the Hooper Foundation for Medical Research, University of California Medical School, San Francisco, at a special convocation of the faculty, alumni and invited guests of the College of Medical Evangelists of Los Angeles, April 23. The meeting, which followed a dinner, was addressed by Dr. Meyer on "Neurotropic Viruses and Diseases Caused by Them." Other speakers were Dr. Percy T. Magan, Los Angeles, president of the medical college; Dr. Howard Morrow, San Francisco, president, California State Department of Health; Dr. Edward M. Pallette, Los Angeles, president-elect of the state medical association, and Dr. Wilton L. Halverson, Pasadena, health officer of Pasadena. Dr. Benton N. Colver, Glendale, acted as toastmaster. A native of Basle, Switzerland, Dr. Meyer received the degree of doctor of philosophy at the University of Zurich in 1924. He is 51 years of age and has been with the University of California since 1914.

**Deaths from Accidental Causes.**—In 1935 there were 5,774 deaths in California due to external causes as compared with 5,567 such deaths in 1934 and 5,153 in 1933. This increase occurred in spite of a reduction in the total number of motor vehicle deaths and may be attributed largely to an increased number of falls in the home, according to the state health department. Falls in the home were responsible for 805 deaths last year as compared with 662 in 1934 and 660 in 1933. There were 2,786 deaths from motor vehicle accidents, 1,043 attributed to collisions with pedestrians, 854 to collisions with other motor vehicles, 200 to collisions with fixed objects and 514 of these deaths were in noncollision accidents. Eighty-seven deaths were due to collisions with railroad trains, forty-eight with electric cars, thirty-seven with bicycles and three with horse drawn vehicles. Deaths in home accidents totaled 1,398, 805 due to falls, 251 to conflagrations, burns and explosions, ninety-three to poisonings, sixty to absorption of poisonous gases, forty-three to firearms, and thirty-nine to mechanical suffocations, twenty-seven of which were deaths of infants. A total of 1,045 deaths was recorded in public accidents; 324 attributed to drowning, 211 to falls, 118 to railroad accidents and sixty-seven to street car accidents not involving motor

vehicles. There were forty-nine deaths in water transportation and forty-nine in air transportation. There were 477 occupational deaths recorded, 142 of which were due to accidents in general trades.

### DISTRICT OF COLUMBIA

**Bill Introduced.**—S. 3514 has been reported to the House, with amendments, proposing to regulate the manufacturing, dispensing, selling and possession of narcotic drugs in the District of Columbia.

### GEORGIA

**Public Health Conferences.**—The Medical Association of Georgia, cooperating with the state board of health and the U. S. Public Health Service, will begin a series of conferences on public health, June 15, to be held in each district of the state. The conferences will be locally sponsored by the officers of the district medical society. One team will open in Rome, June 15, with a discussion on pediatrics, obstetrics and venereal diseases, continuing in a different district the next day with the same program. A second team will open in Rome, June 23. Its program will deal with heart disease, cancer and preventive inoculations. The first team closes its series in Savannah June 26 and the second, July 3.

**Health at Atlanta.**—Telegraphic reports to the U. S. Department of Commerce from eighty-six cities with a total population of 37 million, for the week ended May 16, indicate that the highest mortality rate (21.1) appears for Atlanta and for the group of cities as a whole, 11.9. The mortality rate for Atlanta for the corresponding period last year was 13.7 and for the group of cities, 11.7. The annual rate for eighty-six cities for the twenty weeks of 1936 was 13.4 as against a rate of 12.5 for the corresponding period of the previous year. Caution should be used in the interpretation of these weekly figures as they fluctuate widely. The fact that some cities are hospital centers for large areas outside the city limits or that they have a large Negro population may tend to increase the death rate.

### IDAHO

**Society News.**—Dr. Clarence L. Lyon, Spokane, addressed the North Idaho District Medical Society in Lewiston recently on convulsions in children. At a recent meeting Drs. Arthur Betts and James M. Nelson, Spokane, presented papers on "X-Ray Diagnosis of Organic Pathology of the Colon" and "Acute and Chronic Empyema" respectively.

### ILLINOIS

**Meeting of Bacteriologists.**—The Society of Illinois Bacteriologists held its annual meeting, May 1, in Chicago, at the Allerton Hotel. The following spoke:

- W. D. Dotterer, Ph.D., Bacteriology as an Aid to the Milk Industry.
- C. S. Boruff, Peoria, Practical Applications of Fermentology in the Distilling Industry.
- H. J. Shaughnessy, Ph.D., Nell Hall, J. O. Alberts, M.S., and F. Frierer, state department of public health, Springfield, Experiences with the Use of Special Methods in the Isolation and Identification of Typhoid Bacilli from Blood, Feces and Urine.
- Drs. Gail M. Dack, Lester R. Dragstedt and Theodore E. Heinz, Bacteriology of Chronic Ulcerative Colitis.

### Chicago

**Society News.**—The Chicago Orthopedic Society was addressed, May 22, by Drs. Géza de Takáts on "Reflex Dystrophy of the Extremities"; Arthur Krida, New York, "Synovectomy" and "Crucial Ligament Repair," and Leo Mayer, New York, "Tendon Surgery."—At a meeting of the Chicago Society of Allergy, May 18, Drs. Ralph H. Scull and Francis L. Foran discussed "Hypersensitiveness in Chronic Flexural Eczema: A Study of Fifty-Five Cases"; Townsend B. Friedman, "Allergy in Children," and Leon Unger, "Asthma in Children: Results of Treatment."—The Chicago Neurological Society was addressed, May 21, by Drs. Leroy H. Sloan and Abraham S. Freedberg on "Epileptiform Manifestations with Hypersensitivity of the Carotid Sinuses"; Theodore T. Stone and Eugene I. Falstein, "Huntington's Chorea," and Samuel B. Broder, "Sleep Induced by Sodium Amytal: An Abridged Method for Use in Mental Illness."—Speakers before the Chicago Society of Internal Medicine, May 25, included Drs. Andrew C. Ivy on "Humoral Transmission of Nerve Impulses" and Joseph L. Miller, "Amoebiasis, with Especial Attention to the High Incidence of Carriers."—At a meeting of the Chicago Ophthalmological Society, May 25, Dr. James E. Lebensohn read a paper entitled "Concerning Certain Commercial Aspects of the Spectacle Industry," and Dr. Elias Selinger, "Retinal Angiospasm."

## INDIANA

**Cancer Committee Formed.**—The *Journal of the Indiana State Medical Association* announces the appointment of a cancer committee for the association. Members are Drs. Charles W. Myers, Indianapolis, Edward M. Pitkin, Martinsville, and Paul W. Ferry, Kokomo.

**Research on Dental Diseases.**—Announcement is made of the plan to establish a research center at the Indiana University School of Dentistry, Indianapolis, for the study of dental diseases of children. According to the *Caduceus*, the federal government will equip a clinic at the dental school with fifteen modern units so that research may begin next fall.

**Graduate Courses.**—At the annual postgraduate course of the Indiana State Medical Association in the Claypool Hotel, Indianapolis, April 8-9, speakers were:

Dr. Gatewood, Chicago, Malignant Tumors of the Stomach and of the Bowel.

Dr. Charles Wolferth, Philadelphia, Observations on the Mechanism and Clinical Interpretation of Heart Sounds.

Dr. Walter W. Hamburger, Chicago, Heart Diseases.

Dr. Dean Lewis, Baltimore, Neoplastic Diseases.

The Indiana University School of Medicine sponsored its annual graduate course, April 6-11. Guest speakers included Drs. Ralph H. Major, Kansas City; Max M. Peet, Ann Arbor, and Willis C. Campbell, Memphis, Tenn.

## IOWA

**State Medical Election.**—Dr. Edward M. Myers, Boone, was chosen president-elect of the Iowa State Medical Society at the recent annual meeting in Des Moines, and Dr. Prince E. Sawyer, Sioux City, was inducted into the presidency. The next annual session will be held in Sioux City, May 12-14, 1937.

**Graduate Meeting in Sidney.**—At the regular meeting of the Southwestern Iowa Postgraduate Medical Society in Sidney, recently, the program was made up of ten minute papers presented, among others, by the following Omaha physicians:

George P. Pratt, Coronary Disease.

Earl C. Sage, Treatment of Toxemias of Pregnancy.

Thomas D. Boler, Treatment of Acute Conditions of the Prostate.

Frank M. Conlin, Emergencies of the Diabetic.

Robert D. Schrock, Treatment of Highway Accidents.

Abram E. Bennett, Artificial Fever Treatment.

Dr. Carl H. Davis, Milwaukee, presented a motion picture film on "Parturition in Monkeys."

**Society News.**—Dr. Allan G. Felter, Van Meter, discussed "Factors in the Management of the Failing Heart" before the Dallas-Guthrie County Medical Society in Panora, April 16, and Dr. Keith W. Diddy, Perry, "Coronary Calculus."—At a meeting of the Jasper County Medical Society in Newton, April 7, Dr. Francis A. Ely, Des Moines, spoke on "Eye Symptoms in Neurology."—The Pottawattamie County Medical Society was addressed by Dr. Walter D. Abbott, Des Moines, May 25; his subject was "Presacral Neurectomy in the Treatment of Certain Pelvic, Bladder and Bowel Disorders."—At a meeting of the Sac County Medical Society in Odebolt, April 13, Drs. Emmett McMahon and John Harry Murphy, both of Omaha, spoke on infectious diseases and fatigue in children, respectively.—Dr. Irving H. Borts, Iowa City, addressed the Woodbury County Medical Society in Sioux City, April 22, among others, on "Laboratory Diagnosis of Malta Fever and the Use of Brucellin in Treatment" and Dr. Carl F. Jordan, Des Moines, "Undulant Fever in Iowa."

## LOUISIANA

**Annual Longer Life Week.**—The Orleans Parish Medical Society sponsored its annual "longer life week," May 18-23, devoting the entire week to an educational program on appendicitis. Letters were sent to members of the society asking them to use stickers warning of the dangers of purgatives in abdominal pain on their bills and correspondence during May; to druggists, asking them to use similar stickers on all laxatives and purgatives sold during "longer life week" and to display posters; to business houses and stores asking them to display similar posters; to schools, colleges, parent-teacher associations, social and business clubs and similar organizations asking for permission to address them on acute appendicitis. A joint meeting of the medical students of Tulane and Louisiana State universities was devoted to a consideration of appendicitis. At a symposium of the Orleans Parish Medical Society, May 11, speakers included Drs. Frederick F. Boyce, Oscar W. Bethea, John Signorelli, Carl C. Dauer, Ambrose H. Storck and George D. Feldner. A report on the mortality of acute appendicitis in eight New Orleans hospitals during the past two years was presented by Dr. Nathan H. Polmer.

**Bills Introduced.**—H. 19 proposes to levy an annual license tax of \$300 on each person, association, firm or corporation selling patent medicines at wholesale or at retail for each and every place of business in the state in which such patent medicines are sold. "Patent medicines" within the meaning of the bill are defined to include any and all articles intended to be used for medicinal purposes which are prepared from secret formulas and placed in containers for sale without further preparation. H. 60 purports to prohibit the sale or distribution of any patent medicine, drug, ointment, salve, antiseptic, tooth paste, mouth wash, hair dye, depilatories or other medicament unless there is first filed with the state board of health a sworn statement listing the ingredients and quantities contained in the particular article and obtaining from the board a certificate of approval authorizing the sale or distribution of such article in the state. H. 88, to amend the Narcotic Drug Act, proposes that any person violating any provision of the act be punished on conviction by imprisonment, with or without hard labor, for not less than six months nor more than five years. The present law provides that a convicted violator shall be confined at hard labor for not less than twenty months nor more than five years. H. 99 proposes to prohibit a drug retailer from using advertising which (1) is intentionally inaccurate in any material particular or (2) misrepresents merchandise, in respect to its use, trademark, grade, quality, quantity, size, origin, material, content or preparation or (3) lays claim to a policy or a continuing practice of generally underselling competitors.

## MAINE

**State Medical Meeting at Rangeley.**—The eighty-fourth annual session of the Maine Medical Association will be held in Rangeley, June 21-23, with headquarters at the Rangeley Lake Hotel, under the presidency of Dr. John L. Johnson, Bangor. Morning sessions will be devoted to conferences on miscellaneous topics. Tuesday afternoon the program will be presented by the following physicians:

William V. Cox, Lewiston, Recent Advances in Gastro-Intestinal Surgery.

Ralph L. Barrett, New York, Office Treatment of Endocervicitis.

Elton K. Blaisdell, Portland, More Recent Developments in Diabetic Treatment.

Carl E. Blaisdell, Bangor, Hematuria.

Doris A. Murray, Washington, D. C., Maternal Child Health and Crippled Children's Programs Under the Social Security Act.

A cancer symposium will be conducted Tuesday afternoon. Out of town speakers on this program will include Drs. Elliott C. Cutler, Moseley professor of surgery, and Soma Weiss, associate professor of medicine, Harvard Medical School, Boston.

## MASSACHUSETTS

**The Gay Lecture.**—Dr. William Dacre Walker, Andover, presented the George Washington Gay Lecture at Tufts College Medical School, April 22. His subject was "What the Small Town Doctor Does." The George Washington Gay Lectureship Fund was established in 1926 with a gift from Dr. George W. Gay, Chestnut Hill, for lectures at Tufts on medical ethics and the art and practice of medicine.

**Medical School Participates in Tercentenary.**—Demonstrations, informal discussions, special clinics and four symposiums will constitute the program of Harvard Medical School, Boston, September 14-15, for its observance of the tercentenary of Harvard University. The university's celebration begins July 1. The annual meeting and dinner of the Harvard Medical Alumni Association will be held on the evening of September 15 in Vanderbilt Hall. This meeting has been postponed from its usual time in June in honor of the tercentenary and to encourage the return at this time of as many graduates as possible. The symposiums will be presented by the faculty of the medical school on the following subjects: nutrition and the deficiency diseases, under the chairmanship of Dr. George R. Minot; nervous system, central and sympathetic, chairman Dr. Walter B. Cannon; infectious diseases, chairman Dr. Hans Zinsser, and the endocrine glands, chairman Dr. James Howard Means.

## MICHIGAN

**University News.**—Dr. Raymond W. Waggoner, associate professor of neurology, University of Michigan Medical School, Ann Arbor, has been granted a leave of absence from September 1 to March 1, 1937; he plans to spend this time in research in England. A gift of \$5,000 has been given by Mr. James Inglis, Ann Arbor, to the University of Michigan to establish the James and Elizabeth Inglis Fund for surgical research.

Dr. Harley A. Haynes, medical director of the University Hospital, has been appointed acting medical director of the state psychopathic hospital by the board of regents.

**State Society Night.**—Officers of the Michigan State Medical Society were guests of the Oakland County Medical Society at the Birmingham Community House, Birmingham, April 21. This was the first "state society night" in Oakland County; others have been observed in Jackson and Genesee counties. State society officers present at the meeting included Drs. Grover C. Penberthy, Detroit, president; Henry Cook, Flint, chairman of the council; Frank E. Reeder, Flint, speaker of the house of delegates; Henry R. Carstens, Detroit, chairman of the finance committee; James H. Dempster, Detroit, editor of the state journal; Howard H. Cummings, Ann Arbor; Theodore Heavenrich, Port Huron, and Andrew S. Brunk, Detroit, counselors; Clifford T. Ekelund, Pontiac, and Mr. William J. Burns, secretary and executive secretary respectively. Dr. Frederick A. Baker, Pontiac, was toastmaster.

### MINNESOTA

**Memorial to Dr. Millard.**—A monument erected on the grave of Dr. Perry H. Millard, the first dean of the University of Minnesota Medical School, Minneapolis, will be dedicated in Fairview Cemetery, Stillwater, June 7. In addition, a suitable plaque is to be placed in the university and surplus funds collected for the memorial are to be turned into the general fund of the Medical Alumni Association. The principal address at the dedication ceremonies, June 7, will be delivered by Dr. James T. Christison, St. Paul. Other speakers will include Dr. William J. Mayo, Rochester, a regent of the university; Dr. Elias P. Lyon, Minneapolis, dean of the medical school; Guy S. Ford, LL.D., dean of the graduate school, and Dr. Edward A. Meyerding, St. Paul, secretary of the Minnesota State Medical Association. The medical department of the medical school, including dentistry and pharmacy, was created in 1888. Dr. Millard was named dean and held the position until his death in 1897. In 1893 a loan of \$65,000 from Dr. Millard made possible the construction of the old Millard Hall and the old chemistry building, and in 1895 the laboratory of medical science was added.

### MONTANA

**Society News.**—The Hill County Medical Society was addressed at Havre, April 8, by Dr. Ernest R. Anderson, Minneapolis. Dr. Anderson also addressed the Cascade County Medical Society at Great Falls, April 9.

**Personal.**—Dr. Elmer G. Balsam, Billings, has been reappointed a member of the Montana State Board of Health. Dr. John H. Garberson, Miles City, has been reappointed to serve seven years as a member of the Montana Medical Examining Board.

### NEVADA

**Dr. Worden Named State Health Officer.**—Dr. John E. Worden, Carson City, has been appointed state health officer of Nevada, according to the *American Journal of Public Health*. He succeeds Dr. Edward E. Hamer. Dr. Worden is a graduate of Northwestern University Medical School, Chicago, class of 1899.

### NEW JERSEY

**Personal.**—Dr. Augustus L. L. Baker, Dover, has been appointed a member of the state board of health, to succeed Dr. Samuel A. Cosgrove, Jersey City, whose term expired. Dr. Wells P. Eagleton, Newark, was guest of honor at a dinner given by the medical staff and trustees of the Newark Eye and Ear Infirmary, April 26. The occasion was the twenty-fifth anniversary of his appointment as medical director of the infirmary.

**State Medical Meeting at Atlantic City.**—The one hundred and seventieth annual meeting of the Medical Society of New Jersey will convene at Haddon Hall, Atlantic City, June 2-4, under the presidency of Dr. Marcus W. Newcomb, Brown's Mills. Guest speakers will include the following physicians:

James R. McCord, Atlanta, Ga., Conservative Treatment of Eclampsia.  
Walter E. Lee, Philadelphia, Role of Surgery in Pulmonary Tuberculosis.

Israel M. Rabinowitch, Montreal, Medical Complications in Diabetes Mellitus.

Arthur C. Christie, Washington, Medical Progress Under the Leadership of the Medical Profession.

William Gregory Cole, New York, Roentgenologic Characteristics of Different Types of Pneumonia.

Burrill B. Crohn, New York, Prognosis in Regional Ileitis.

There will be a symposium on tumors of the reticulo-endothelial system, presented by New Jersey physicians and Dr. Ira I. Kaplan, New York. Drs. Rudolph V. Gorsch, New

York, and Carroll D. Smith, Paterson, will conduct a symposium on the injection therapy of hemorrhoids. The woman's auxiliary to the state medical society will hold its ninth annual meeting during the three days of the state society session. The auxiliary will also have charge of the president's banquet and ball Tuesday evening, when Dr. Newcomb will deliver his presidential address, and Dr. Francis R. Haussling, Newark, president-elect, his inaugural speech. Mr. James Farrell, editor, *Atlantic City Union*, will also give an address entitled "The Medical Profession and the Press," and the awards of merit will be presented by Dr. Thomas S. Cullen, Baltimore.

### NEW YORK

**Personal.**—Dr. Harold E. Himwich, who joined the faculty of Albany Medical College in October 1935 as associate professor of physiology, has been made professor of physiology and pharmacology. William D. Coolidge, Ph.D., director of the research laboratories of the General Electric Company, Schenectady, has been made an honorary associate member of the Pan American Medical Association. Dr. Stanton Curry, Peekskill, was guest of honor at a banquet given by physicians of Peekskill, March 9. He has practiced in Peekskill thirty-eight years. A. Bertrum Lemon, Ph.D., professor of materia medica, University of Buffalo, since 1922, has been named dean of the school of pharmacy to succeed Dr. Willis G. Gregory, who has been dean for forty-six years. Dr. Lemon has been affiliated with the university since 1916.

**New York's Health in 1935.**—Vital statistics for New York for 1935 showed a death rate of 10.8 per thousand of population, the lowest rate in half a century, according to *Health News*. The birth rate (13.5 per thousand of population) was also the lowest on record. Infant mortality showed a rate of 48 per thousand live births and maternal mortality a rate of 48.5 per 10,000 of all births; both were the lowest ever recorded. New low rates were recorded for typhoid, pneumonia, bronchitis, tuberculosis and accidents. The rate for diphtheria (0.7 per hundred thousand of population) was the lowest ever known in the state. Greater prevalence of measles, scarlet fever and whooping cough resulted in rises in death rates from these diseases. Almost three fourths of the deaths were attributed to heart disease, cancer, pneumonia, nephritis, cerebral hemorrhage, accidents and tuberculosis. The suicide rate (15.3) was the lowest since 1926 and the homicide rate (4.1) the lowest for twenty years. For the first time in nine years the death rate from diabetes did not increase (30.8).

### New York City

**Biggs Memorial Lecture.**—Lord Horder of London delivered the eleventh Hermann Michael Biggs Lecture at the New York Academy of Medicine, May 7, on "Eugenics as a Form of Preventive Medicine."

**University News.**—The Rockefeller Foundation has appropriated \$10,000 to Columbia University, with the provision that \$8,000 is to be used for research on poliomyelitis and \$2,000 for research on speech disturbances and other neurologic problems. The annual Alumni Day of the Cornell Medical Alumni Association was observed, May 7. A scientific program was presented during the day at the college and New York Hospital, and in the evening there was a banquet at the Biltmore.

**Memorial to Dean Miller.**—The Long Island College of Medicine announces the foundation of a lectureship in memory of the late Adam Miller, M.A., for many years professor of anatomy and dean of the school from 1922 until his death in May 1935. The lectureship is made possible by a contribution from Theta chapter of Phi Lambda Kappa. Its scope is not limited, but it is anticipated that the subjects will usually be related to anatomy and embryology, as Dean Miller was identified with that phase of research and education. The first lecture will be delivered in the autumn.

**Society News.**—The Medical Society of the County of Queens was addressed, April 21, by Drs. Haven Emerson on "A Study of Organized Medical Care in the Metropolitan Area"; Alfred E. Shipley, "Administrative Progress in the Department of Hospitals," and Harry P. Mencken, "Present Day Hospital Problems." The Medical Society of the County of New York held a meeting in conjunction with the Registered Nurses Association of New York County, May 25, with the following speakers: Mary M. Roberts, editor, *American Journal of Nursing*, on "The Findings of the Committee on the Grading of Nursing Schools"; Marion W. Sheahan, director of the division of nursing, state department of health, on "How Legislation Might Improve Conditions in Nursing," and Lulu St. Clair, executive secretary, Joint Committee on Community Nursing Service, "How Nurses and Doctors Can Cooperate

for Better Community Nursing Service."—Dr. Edward J. Hyland, Jamaica, addressed the Queensboro Surgical Society, May 18, on "Gunshot Wounds of the Abdomen."

### OKLAHOMA

**Society News.**—Drs. Robert M. Howard and Herbert Dale Collins, Oklahoma City, addressed the Creek County Medical Society, Bristow, April 2, on the thyroid gland and appendicitis, respectively.—Drs. Wesley R. Mote, Ardmore, and James I. Hollingsworth, Waurika, among others, addressed the Carter, Stephens and Jefferson Counties Medical Society, Healdton, recently, on "Complications and Management of Respiratory Infections" and "Gallbladder Diseases of Young Subjects" respectively.

**State Medical Election.**—Dr. Samuel A. McKeel, Ada, was chosen president-elect of the Oklahoma State Medical Association at the annual meeting in Enid recently, and Dr. George R. Osborn, Tulsa, was installed as president. Tulsa was designated as the place for the 1937 meeting. At the meeting of the house of delegates, April 7, it was decided to double the membership dues. Since this money will not be available until January, it was agreed that each county be requested to contribute to maintain a permanent office in Oklahoma City.

### PENNSYLVANIA

**District Meeting.**—Dr. Morris Fishbein, Chicago, editor of THE JOURNAL, addressed the annual meeting of the Third Council District of the Medical Society of the State of Pennsylvania at Skytop Lodge in Monroe County, May 23, on "Medicine and the Changing World." The following officials of the state society made five-minute talks: Drs. Alexander H. Colwell, Pittsburgh, president; Maxwell J. Lick, Erie, president-elect; William H. Mayer and Chauncey L. Palmer, Pittsburgh, and Francis F. Borzell, Philadelphia, chairmen respectively of the committees on public relations, public health legislation and medical economics; Thomas R. Gagon, Pittston, member of the committee on public health legislation, and Mrs. Harry M. Kraemer, Scranton, counselor for the Woman's Auxiliary of the third district.

#### Philadelphia

**Interns' Night.**—May 13 was "Interns' Night" for the Philadelphia County Medical Society. Interns made the following presentations:

- Dr. Paul B. Patton, Graduate Hospital, Effect of Estrogenic Substances in Certain Cases of Diabetes Mellitus
- Dr. Donald Wilson Hastings, Philadelphia General Hospital, Difficulties in Differential Diagnosis of Brain Tumor in Older Age Groups
- Dr. Louis Spitz Jr., Mount Sinai Hospital, Ketogenic Diet in Urinary Tract Infections.
- Drs. Forrest F. Smith Jr. and William F. Hartman, Methodist Episcopal Hospital, A Case of Full Term Tubal Pregnancy with Removal of Fetus Four and One-Half Months After Calculated Term

#### Pittsburgh

**Society News.**—Speakers before the Pittsburgh Surgical Society, April 17, were Drs. John H. Alexander, on "Tuberculous Granuloma of the Cecum"; John W. Stinson, "A New Procedure in Herniorrhaphy," and Gustav F. Berg, "Open Reductions in Fractures."—Among other speakers at a meeting of the Allegheny County Medical Society, May 19, Dr. Wilfred J. Finegold presented the prize-winning case history in the society's contest, on "A Case of *Tabes Dorsalis* and *Myeloid Chloroma*."—Drs. Theodore O. Elterich and Harold G. Kuehner, among others, addressed the Pittsburgh Academy of Medicine, May 12, on "Hypothyroidism in Childhood: Its Detection and Management" and "Trauma Within the Knee Joint and Its Treatment" respectively.

### RHODE ISLAND

**Obstetrical Meeting.**—The eighth spring meeting of the New England Obstetrical and Gynecological Society was held in Providence, May 28. Dr. Fred L. Adair, Chicago, was guest speaker on "Obstetric Hemorrhages." In addition, clinics were held in various hospitals and the following physicians, among others, presented papers:

- John G. Walsh, Management of 100 Cases of Placenta Praevia at the Providence Lying-In Hospital.
- Frank T. Fulton, Treatment of Heart Disease Complicating Pregnancy and Labor in 609 Cases at the Providence Lying-In Hospital.
- William P. Bufum and Robert M. Lord, Treatment of Premature Infants, with Demonstration of an Inexpensive Oxygen Box.
- Edward S. Brackett, Deduction to Be Drawn from 108 Maternal Deaths at the Providence Lying-In Hospital.
- George W. Waterman, Presacral Nerve Resection.
- Thomas W. Grzeben, Parhyterectomy versus Supracervical Hysterectomy.
- John F. Murphy, Gonorrhea in the Female.

### TEXAS

**Society News.**—Drs. Isidore Cohn, New Orleans, and Leroy Long, Oklahoma City, were guest speakers at the semiannual meeting of the Texas Surgical Society at Fort Worth in April. Dr. Cohn spoke on "Lymphaticovenous Fistula" and Dr. Long on "Prevention of Postoperative Intestinal Incompetence."—At a meeting of the Kaufman County Medical Society, Terrell, April 7, speakers were Drs. Percy M. Girard, Dallas, on "Fractures of the Elbow"; Ozro T. Woods, Dallas, "Treatment of Starvation," and Delmas T. Friddell, Terrell, "Chronic Ulcerative Colitis."—Drs. Van D. Rathgeber, Fort Worth, and Berry L. Jenkins, Clarendon, addressed the Tarrant County Medical Society, Fort Worth, April 7, on "Use of Procaine Crystals as a Topical Anesthetic in Nasal Surgery" and "Encephalitis Lethargica" respectively.

### GENERAL

**Changes in Status of Licensure.**—The California State Board of Medical Examiners reports the following action taken at its meeting in Los Angeles, March 9-12:

- Dr. James W. Brownlie, Vallejo, placed on probation for three years without federal narcotic permit or possession of narcotics.
- Dr. Manford Dummit, Compton, placed on probation for five years without federal narcotic permit or possession of narcotics.
- Dr. Homer L. Keeney, San Francisco, placed on probation for five years without federal narcotic permit or possession of narcotics.
- Dr. Walter F. Fike, Oakland, placed on probation for five years, without federal narcotic permit or possession of narcotics.

**Society News.**—Dr. Ross McC. Chapman, Towson, Md., was chosen president-elect of the American Psychiatric Association at the annual meeting in St. Louis, May 4-8. Dr. Charles MacFie Campbell, Boston, was installed as president and Dr. William C. Sandy, Harrisburg, Pa., was reelected secretary. The next annual meeting will be in Pittsburgh at a date in May or June 1937 to be fixed later.—Dr. Esmond R. Long, Philadelphia, was elected president of the National Tuberculosis Association at the annual meeting in New Orleans, April 23, and Dr. Charles J. Hatfield, Philadelphia, was reelected secretary. The next annual session will be held at Milwaukee, probably May 24-30, 1937.

**Meeting of Gastroenterologists.**—The first convention of the National Society for the Advancement of Gastro-Enterology and its New Jersey chapter, the New Jersey Gastroenterological Society, will be held in Haddon Hall, Atlantic City, June 5. The section on gastro-enterology of the Medical Society of New Jersey will meet June 4. Among speakers on both programs will be the following physicians:

- Louis L. Perkel, Jersey City, N. J., Gastric Polyposis.
- Gustave Buchy, New York, X Ray Demonstration of the Mucous Membrane of the Stomach and Duodenum.
- Elmer B. Freeman, Value of Endoscopic Examination in the Diagnosis of Gastro-Intestinal Lesions
- Emanuel Z. Epstein, New York, Cholesterol Metabolism and Liver Disorders.
- Martin E. Rehffuss, Philadelphia, Gallbladder Disease and the General Practitioner.

**Motor Accidents Increased in 1935.**—The total number of deaths caused by motor vehicles in 1935, as estimated by the National Safety Council, was 36,400, an increase of 1 per cent over 1934. In all, accidents caused about 99,000 deaths, 31,500 having occurred in homes, 16,500 being incident to occupations and 17,500 to other public activities. Two thirds of all traffic accidents in 1934 occurred in small towns and rural areas. Rural fatalities have increased 44 per cent since 1924, whereas deaths in cities have advanced but 27 per cent. More than 40 per cent of last year's victims were pedestrians. Home fatalities were 9 per cent less than in 1934, an outcome attributed to fewer deaths from excessive heat, most of which are classified as home accidents. Public accidents not involving a motor vehicle were the same as for 1934, drownings and firearms accidents accounting for a large proportion. In addition to deaths, there were 365,000 permanent disabilities and 9,100,000 temporary disabling injuries. The cost of accidents was estimated at \$3,400,000,000.

**Infant Mortality Higher in Rural Areas.**—Infant mortality was higher in 1934 in the rural areas than in the cities of the United States, the respective rates recorded being 62 and 58 deaths per thousand, according to the *Statistical Bulletin* of the Metropolitan Life Insurance Company. Twenty-two states, however, showed higher rates in the cities than in the rural areas. In certain states the higher ratio of urban to rural mortality was considerable. These ratios ranged from 140 to 145 per cent in Tennessee, Arkansas and West Virginia. Among the twenty-one states in which higher infant mortality rates were reported in the rural areas, California reported a ratio of urban to rural mortality of only 71 per cent. In five states the rates were identical in the urban and rural areas. The rates

in the urban areas of the states as a whole have declined 7.9 per cent since 1930 while that in the rural areas has declined 6.1 per cent. The rural districts show declines in all but five states, according to the bulletin, whereas there were rises in the infant mortality in the urban population in eleven states.

**Medical Bills in Congress.**—*Changes in Status:* S. 5, the Copeland bill, has been reported to the House, with amendments, proposing to prevent the adulteration, misbranding, and false advertising of food, drugs, devices and cosmetics. The House Committee on Interstate and Foreign Commerce struck out all after the enacting clause of the bill as passed by the Senate and reported a substitute bill to the House. H. R. 9185 has been reported, with amendments, to the Senate, proposing to enact a "Liquor Tax Administration Act." This bill, among other things, proposes to amend existing law so as to authorize the obtaining of alcohol tax free "for the use of any clinic operated for charity and not for profit, including use in the compounding of bona fide medicines for treatment outside of such clinics of patients thereof, but not for sale." *Bills Introduced:* H. R. 12757, introduced (by request) by Representative Knutson, Minnesota, proposes to amend the Social Security Act so as to authorize federal aid to the states in furnishing financial assistance to disabled adult needy citizens. H. R. 12764, introduced by Representative Vinson, Kentucky, proposes to create in the Bureau of the Public Health Service a Division of Stream Pollution Control. H. R. 12793, introduced by Representative Norton, North Carolina, proposes to amend certain administrative provisions of the internal revenue laws. The bill, among other things, proposes to amend the Harrison Narcotic Act so as to provide that a person not registered as an importer, manufacturer, producer or compounder and lawfully entitled to obtain and use any of the narcotics covered by the act in a laboratory for the purpose of research, instruction or analysis shall pay a special tax of \$1 per annum and shall keep such special records as the Commissioner of Narcotics, with the approval of the Secretary of the Treasury, may by regulation require.

#### CANADA

**Dr. Archibald Awarded Trudeau Medal.**—Dr. Edward W. Archibald, for many years director of the surgical department, McGill University Faculty of Medicine, Montreal, has been awarded the Trudeau Medal of the National Tuberculosis Association. Dr. Archibald was made an honorary fellow of the Royal College of Physicians of London in 1927, the fourth Canadian to be thus honored.

**Dominion Medical Meeting.**—The annual meeting of the Canadian Medical Association will be held in Victoria, B. C., June 22-26. Speakers announced for the general sessions include:

Dr. Verne C. Hunt, Los Angeles, Curability of Cancer of the Stomach.  
Dr. James B. Collip, Montreal, Significance of Recent Investigations of the Ductless Glands.

Dr. Charles H. Best, Toronto, Methods of Administration of Hormones, with Special Reference to Protamine Insulin.  
Sir Frederick Banting, Toronto, Silicious Research.

Dr. John A. Gunn, Winnipeg, Surgery of the Sympathetic Nervous System.

Dr. Beverley C. Leech, Regina, Sask., The Present Trend in Anesthesia.

Dr. Alfred T. Barin, Montreal, Primary Tumor of Bone.

Dr. Edward W. Archibald, Montreal, will deliver the Lister Oration.

### Government Services

#### Advisory Board to Formulate Health Code

The establishment of an advisory board to formulate a standard public health code has been announced. Members of the advisory committee include:

W. Frank Walker, Dr. P.H., of the Commonwealth Fund, New York.  
Henry F. Vaughan, Dr. P.H., health commissioner of Detroit.

Dr. Hugh R. Leavell, health officer of Louisville.  
A. D. Weston, chief sanitary engineer, Massachusetts State Health Department, Boston.

H. A. Whittaker, chief sanitary engineer, Minnesota State Health Department.

Dr. James N. Baker, state health officer, Montgomery, Ala.

Dr. Earl G. Brown, state health officer, Topeka, Kan.

Dr. George C. Ruhland, health commissioner of the District of Columbia.

The first problem in this project sponsored by the Treasury Department will be for each city or community to bring its present health code into conformity with a tentative draft under five headings: organization, control of cases of communicable diseases, control of environment, birth morbidity and mortality reporting and the keeping of records, and education and publicity and the right of entry.

## Foreign Letters

### LONDON

(From Our Regular Correspondent)

April 11, 1936.

#### The Progress of Physical Medicine

Lord Horder presided at a luncheon in connection with the International Congress of Physical Medicine, to be held in London May 12 to 16. Thirty countries agreed to send representatives. Dr. Richard King Brown, editor of the *British Journal of Physical Medicine*, the principal guest, was presented with a wrist watch in recognition of his services to physical medicine. Lord Horder said that he had the privilege of being honorary president of the congress but unfortunately could not be present, as last August he accepted an invitation to attend the meeting of the American Medical Association in Kansas City. He welcomed the congress as calculated to stimulate interest in this growing branch of preventive and curative medicine. Only in recent years had the methods of physical therapy been brought under scientific control, which was essential. There now existed such a wealth of methods and instruments that one almost hoped that nothing further might be introduced for a while, so as to allow a breathing space for the trial under careful observation of methods already available. Meanwhile physical medicine went from strength to strength. Its achievements had been great; its potentialities were still greater. There were of course pitfalls. It could not be applied indiscriminately to all sorts of diseases. With the public's incorrigible faith in and childlike love for machinery, this temptation became very great. There was also the danger that the physical therapist might not keep closely in touch with the physicist on the one side and the clinician on the other. He should look for support and guidance to the pure physicist and to the pure clinician, taking his problems to them for discussion and criticism. There was the danger that he might wander away from the bed rock of pathology and lose himself in a sea of speculation, or, equally calamitous, construct a pathology of his own, which could not be other than pseudo-pathology. There was also the danger that he and his efforts might be commercialized by the business man.

#### The Treatment of Bone and Joint Tuberculosis

At a meeting of the Tuberculosis Association Sir Henry Gauvain, medical superintendent of the Cripple Hospitals at Alton and Hayling Island, read a paper on the treatment of bone and joint tuberculosis. His experience with the open air and climatic treatment at these hospitals is unique in this country, where he has been a pioneer. He emphasized the importance of remembering that a tuberculous osteitis or arthritis occurred in a tuberculous patient—in other words was secondary to a primary focus elsewhere. Children were often infected through the tonsils or septic teeth, the corresponding glands being involved. Removal of the tonsils and glands might eradicate the disease, but in the majority of cases the primary source of infection was never discovered and only after a more or less prolonged period did osteitis or arthritis supervene, as in tuberculosis of the hip joint. Even excision of the joint, an operation now happily required rarely did not cure the patient of tuberculosis. Tuberculous infection did not necessarily or even usually result in a severe local lesion. When it did, treatment must not concentrate solely on the local lesion but account should be taken that the patient is tuberculous.

Treatment logically followed two lines, general and local. Extirpation of the local lesion, at one time often the treatment of choice when practicable, has become less frequent. It was still of value in certain cases, such as tuberculous knee joint

in an adult, in which excision was frequently indicated, because the length of treatment was shortened, the danger of recurrence largely avoided and the resulting disability trifling, often less than under conservative treatment. Even in these cases it was wise to immobilize the infected limb under good conditions for, say, three months before operating. Excluding such limited types of cases calling for radical measures, conservative treatment was called for. Many years ago Gauvain defined conservative treatment of bones and joints as all measures which tend to improve the patient's health, increase his resistance and preserve or restore the part attacked. He would now somewhat modify the last. In certain cases it might be wise to fix the lesion by operative means, so that the affected part was immobilized and the risk of deformity or disability minimized.

#### PROGRESSIVE SPINAL CARIES IN CHILDREN

In progressive spinal caries in children, Gauvain unhesitatingly avoids bone grafting or fusing, as mechanical immobilization is almost invariably curative and the chances of dissemination of tuberculous meningitis are avoided. If deformity exists, it may often be reduced. But after the disease is arrested operation may be indicated. If the patient has poor dorsal musculature, is of the flabby type and cannot have his after-care satisfactorily supervised, there is danger that a little residual deformity may increase. In these cases Gauvain advocates a bone graft such as that performed by Albee and others. The osteosynthesis may not be sufficient to prevent increase of the deformity and should for some time be associated with a spinal jacket or brace. In borderline cases deformity may be avoided by instruction in back raising exercises. Absolute immobility during the later stages of recumbent treatment is not necessary or desirable.

#### SPINAL FIXATION IN ADULTS

Gauvain said that, while many surgeons would agree with him about osteosynthesis in children, they hold different views as to adults. The great argument is that it shortens treatment. It certainly does during the time the patient is being treated, but that is not the same as shortening the time during which treatment should be given. Gauvain holds that, if undertaken, it should be performed usually only after the disease is no longer advancing. The great defect of the operation is that it obscures evidence of progressive disease. In his experience as consulting surgeon to tuberculosis schemes, Gauvain is amazed at the number of cases of osteosynthesis which subsequently drift to institutions by reason of abscess or other complication following the treatment.

#### HIP AND KNEE DISEASE

In the majority of cases in which conservative treatment is adequate and after-care efficient, operation is not required. If deformity can be corrected, and it nearly always can, the patient is allowed up on crutches, wearing a celluloid splint, when the disease is arrested. The joint remains frequently fixed by fibrous ankylosis. Some patients get adduction deformity. If this cannot be corrected, a bifurcation or other osteotomy should generally be done, with perhaps arthrodesis as well.

In tuberculous disease of the knee in children Gauvain never operates; in adults he favors excision.

#### CLIMATIC TREATMENT

Gauvain considers that climatic and seasonal changes are valuable in treatment by producing varying stimuli. Having an inland and a marine hospital at his disposal, he is able to give his patients a change from one to the other. Sun bathing and light treatment he finds of particular value in multiple lesions in small children and sea bathing of great value in selected cases.

#### TYPE OF HOSPITAL ADVISED

Gauvain prefers the pavilion type of hospital to the type of several stories (usual on the European continent). He objects to wards open on one side, which may be cruel to both patients and staff. His open air wards have folding walls on the southern side, which may be completely opened or closed or intermediate. When closed there is still adequate ventilation. There is panel heating in the floor especially to prevent damp and condensation. If he had had his own way he would have had sliding roofs, which he has designed elsewhere with great satisfaction to those who use them.

#### Illicit Drug Traffic

The difficulties in applying the international conventions, by which the traffic in opium is controlled, were discussed at a meeting of the Central Opium Board of the League of Nations at Geneva. In drafting its report to the council of the league the board has drawn attention to the fact that more opium is grown in the world than can be legitimately consumed. The returns under the conventions show that the main object has been attained so far as legitimate trade is concerned. But with regard to illicit trade it has been found that success can be achieved only by the help of informers. The illicit import seizures of morphine in the United States during 1934 amounted to 24 Kg. and in Canada 2 Kg., together making nearly half the seizures of the world. But the American authorities admit that there are 120,000 drug addicts in the country, and Canada admits to 8,000, and these must have consumed the greater amount of the imports. As neither opium nor coca leaves are grown in either country, and the control of manufacture in both countries is very effective, it is inferred that the illicit traffic must be supplied by unauthorized factories abroad. The board concludes that clandestine factories producing many tons of drugs annually must exist somewhere, showing that the present system of fighting the drug traffic is not effectual.

#### PARIS

(From Our Regular Correspondent)

April 21, 1936.

#### Charlatanism in the Old and the New World

A constant reader of any reputable French newspaper will be astonished, if he is an American, to note the amount of advertising space filled by extravagant claims of charlatans of all sorts. One of the more recent forms of quack diagnosis and treatment, which fills column after column of text, is called "sympathicotherapy." It guarantees to diagnose and cure any form of ailment by pressure on the "sympathetic" nerve endings in the nasal septum. In the April 12 issue of the *Concours médical*, a recent decision of the criminal court of the department of the Seine, in which Paris is situated, is cited and the lesson from this judgment is commented on by one of the editors. A Dr. X, so-called specialist in "sympathicotherapy," was held, March 28, to be guilty of swindling and charlatanism on complaint of a resident in one of the rural districts, who had made an appointment by letter with Dr. X, having read of the latter's "marvelous" results. On arrival at the office the patient was informed that Dr. X was waiting for him. He was given the "nasal touch" treatment by an individual whom the patient assumed to be the famous sympathicotherapist, and on being informed that a series of ten treatments would cost 100 francs (about \$7) immediately paid in advance.

By chance, the patient learned that the real Dr. X was in Egypt, and on comparing the photograph of Dr. X with the physiognomy of the person who had treated him he recognized the substitution.

The evidence presented at the trial showed that Dr. X had established many branch centers of "sympathicotherapy" all over France, selling the local "rights" to exploit the treatment under his name to both unscrupulous practitioners and to some

persons who were not even physicians. Thus thousands of patients could be treated simultaneously. It was estimated that the sum of 50 million francs (over \$3,000,000) had been contributed to the treasury of "sympathicotherapists" during the past three years in France.

In discussing this case, Fischer, the editor, takes a bird's eye view of the subject as it exists in Europe and the Americas.

If publishers were inclined to be less greedy, charlatanism would not be a flourishing industry. It is only through extensive advertising that victims are attracted. In some countries there are publications which are devoted to or specialize, according to Fischer, in this form of publicity. In Germany there are over 150 "reviews" and in England the journal *Health for All* has a circulation of 24,000. The journal of the chiropractitioners is quoted as having had 100,000 subscribers in 1930.

In the July 1935 number of the Bureau of Hygiene of the *League of Nations Bulletin* it is stated that it is difficult to estimate the enormous sums received by charlatans. An instance is cited of a vender of "curative earth" who has a revenue in Germany of a million marks (\$300,000) annually. It is estimated that the 36,150 charlatans of all types in the United States have an annual revenue of \$125,000,000. In England, Flemming has stated that 40,000 hospital beds could be supported by the money received by charlatans.

Certain governments, especially Germany and the Swiss canton of Appenzell, grant charlatans the right to exercise their cult, according to Fischer. In 1930 the ratio of charlatans to licensed practitioners in Germany was 27 to 100. The former, however, cannot be employed in social insurance work in either England or Germany. The majority of charlatans have not pursued any studies beyond those of the grammar school grades. How can the success of charlatans be explained? One can cite diagnosis of diseases that are nonexistent, apparent cures of genuine ailments, spontaneous cures and imaginary maladies. Do not charlatans benefit from the belief in magic, which is firmly rooted in the average person? Do not the charlatans seek to impress the imagination of the sick by a theatrical attitude and by the use of methods that will impress the patient? Often the absolute guaranty of cure by the charlatan has more influence than the honest reserves as to cure expressed by the medical man.

In Germany one encounters not only the lower but chiefly people from the well educated and richer groups of society in the waiting rooms of charlatans; hence, in spite of indictments and even prison terms, the quack always finds some one to defend his methods.

#### Nonprotein Nitrogen Retention Following Operations

French surgeons have been interested in nonprotein nitrogen retention as a postoperative complication for five years. At the Nov. 22, 1935, meeting of the *Société médicale des hôpitaux*, Duval and Roux read a paper in which they stated that a high blood urea is regarded as unfavorable. This, according to the surgeon Duval and to Roux, an internist, is a mistake, so that a high blood urea really makes the prognosis more favorable. Such a condition is due to the entrance into the blood stream of polypeptides that are toxic products of the traumatic devitalization of the tissues around the operative field. This form of nitrogen retention in patients with normal kidneys must be distinguished from that which is the result of damaged kidneys. Their observations on the urea and polypeptide content of the blood serum combined with the determination of the urea content of the urine led Duval and Roux to affirm that in patients who have normal kidneys a postoperative increase in urea in the blood does not necessarily make the prognosis unfavorable. The prognosis depends on the relative modifications of the nitrogen and polypeptide retention as follows: 1. An increasing degree of nitrogen and polypeptide retention are unfavorable only if the latter rises continuously. 2. A normal blood urea

when associated with a rapidly increasing polypeptide retention gives an unfavorable prognosis. 3. A marked and rapidly rising blood urea when it is accompanied by a normal or only transiently elevated polypeptide retention gives a favorable prognosis. In this third group the increased blood urea is the result of an excessive production of urea by the liver at the expense of the polypeptides that accumulate in the blood as the effect of the operation. This urea elaboration by the liver is a sort of compensatory effort and represents the ability of the liver to transform into urea, which is nontoxic, the toxic polypeptides.

In the discussion, Rathery confirmed the view that a postoperative high blood urea in patients with normal kidneys was due to a transitory excessive activity of the liver. The relation of the polypeptides and urea is of primary importance. Labbé also believed that it was a mistake to base the prognosis after operation solely on the blood urea. Brulé stated that in typhoid one finds a high blood urea without serious kidney lesions. Similarly, a high postoperative blood urea bears no relation to such a retention in cases of nephritis.

#### Variations in Tuberculin Reactions in the Army

At the March 3, 1936, meeting of the Académie de Médecine, observations on 2,155 tuberculin skin reactions were made by Benedetti and other medical officers. There were 731, or 33.95 per cent, negative reactions. There was some difference according to whether the recruits were raised in a rural or in a city environment. Of 1,529 of city origin, 390, or 25.5 per cent, and 340, or 54.25 per cent, of 626 of rural origin did not react to tuberculin. Of the total of 2,155 skin tests, 1,219 were done in a regiment stationed at Paris whose soldiers were chiefly of Parisian origin. There were 41.9 per cent negative reactions among these 1,219 city recruits. In a regiment from Northern France 936 tests were made with 23.5 per cent negative results. Attention was called to the fact that the percentage of negative tests varies according to the region from which the recruits come.

April 8, 1936.

#### New Regulations for Jewish Physicians

The national führer of medicine, Dr. Wagner, has just issued regulations, based on the Nuremberg law of Sept. 15, 1935, with regard to the Jewish physicians in Germany. This law does away with the designations "Aryan" and "non-Aryan" and deals with the Jewish question in unequivocal terms. The distinction in the future shall be between Jewish and non-Jewish physicians. The following are classed as Jewish physicians: (1) full Jews (persons having four Jewish grandparents), (2) three-quarters Jews (having three Jewish grandparents), (3) half Jews (persons having two Jewish grandparents) who as of Sept. 16, 1935, were members of the Jewish religious community or who have at any subsequent time assumed such membership; in addition, half Jews, who as of Sept. 16, 1935, were possessed of Jewish marriage partners or who at any subsequent time have contracted marriages with Jews. All physicians not coming under these classifications are collectively designated "non-Jewish"; these include Jewish hybrids (mischlingen: quarter and half Jews) and non-Jewish physicians who are married to Jews.

It is further stipulated that no non-Jewish physician shall permit a Jewish physician to act as his locum tenens. A Jewish physician must substitute only for another Jewish physician. For those doctors who remain in the insurance practice, individual exceptions may be made when it is a question of maintaining adequate medical care for the people. Similar provisions govern the employment of assistants. Non-Jewish physicians must refer their patients only to non-Jewish special-

ists, hospitals, sanatoriums and so on, and vice versa. The non-Jewish doctors, particularly if members of hospital staffs, shall accept assignments from Jewish physicians when professional circumstances appear to permit; this especially applies to sick insurance patients referred by Jewish insurance physicians (since medical service for the insured must not be hampered). For consultations, that is, the calling in of a second physician, the same regulations apply. The registers of non-Aryan physicians formerly maintained are now supplanted by lists of those doctors who fall under the designation of Jewish (as defined). Physicians having Jewish marriage partners are known as "jüdisch versippte" (having Jewish kin). This group together with Jewish hybrids (mischlingen: that is, 50 per cent Jewish) are not included in these lists. The registers are assigned only for professional use.

New regulations with regard to the licensing of physicians are contained in the new physicians' law (THE JOURNAL, February 15, p. 551). Relevant in this connection is the statement of the national führer of medicine that no Jew or Jewish hybrid shall be granted a license to practice in the near future, and the same applies to any German who is married to a Jewess or a Jewish hybrid. As to the license for the sick insurance practice, the old rules remain in force whereby one non-Aryan pair of grandparents is sufficient grounds for denial (THE JOURNAL, Aug. 18, 1934, p. 501); those "having Jewish hybrid kindred" shall likewise be denied admission to the insurance practice.

With regard to operations on sick insurance members, it is stipulated that in the Berlin area only the clinical services of "physicians of German extraction in German private clinics" shall be underwritten. A few weeks after these regulations were made known, the president of the Berlin League of German Physicians offered a frank explanation of the latter rather obscure clause. "It would be," he said, "naturally unthinkable that German doctors should refer their patients to Jewish clinics. I urgently beg of you to observe this provision and I am certain that this suggestion will suffice to forestall any unpleasant consequences."

After April 1, Jewish physicians can no longer visit patients or administer treatment in the private clinics. Thus the previous restrictions that applied to practice in the governmental and municipal hospitals are extended to private institutions. In Berlin there are sixty-five "Aryan" and ten "non-Aryan" private clinics. Heretofore "Aryan" patients were not forbidden to enter "non-Aryan" private clinics. It was considered that such a prohibition might keep the patient from remaining under the care of his personal physician.

By enforcement of the Nuremberg law the Jewish (full) university professors, as far as they are officials, are retired from service with a pension. The rest of the Jewish hochschulen teachers, that is, honorary professors, assistant professors and unsalaried lecturers including those who took part in the World War and even those who were severely wounded, now are informed that the license to teach, the so-called *venia legendi*, has been taken from them.

#### Follow-Up Study of Young Diabetic Patients

Dr. Stockinger has reported a follow-up study of young diabetic patients treated at the medical clinic of the University of Kiel during the last fifteen years. Of thirty-one patients treated for diabetes in the period from 1921 to 1923, but one could be established as still living. Reports on 106 other patients treated subsequent to 1923 are presented. Of this number fifty-one (48.1 per cent) are living, while fifty-five (51.9 per cent) have died despite treatment with insulin. All but two of the survivors adhered strictly to the dietary and insulin regimen as prescribed for them at the clinic. The requisite daily dosage of insulin varied between 20 and 80 units, the average being 60 units.

Of thirty-nine patients dying outside the clinic, thirty-one had manifestly failed to maintain a satisfactory regimen; the records of only eight of this number testified to exemplary behavior, and five of the eight died of complications. Of sixteen fatalities within the clinic, eight were due to complications. In at least eighteen of fifty-five fatal cases, inefficacy of the insulin therapy, as shown by recurrence of coma, could be attributed to infections. The decisive factor was pulmonary tuberculosis in nine of the fatal cases, acute infections in five and appendicitis in three. In one case heredosyphilis was the contributing complication. The young diabetic patient's expectation of life is largely determined by social status and the cultural level of his family. In 75 per cent of all the fatal cases the patients came originally from the country and in 64 per cent they came from impoverished surroundings. The patient's intelligence and the realization of his condition together with self discipline were of major importance. From an examination of the scholastic and professional records of the survivors the impression was gained that youthful diabetic patients rise above the average both morally and intellectually. Dr. Stockinger attributes this superiority to the rigorous natural selection by which the unintelligent are early eliminated. It was also ascertained from observation that school work exercised a deleterious effect on the children.

#### Vital Statistics

Following the marked increase in marriages and the number of births in Germany during 1933 and 1934, a reaction set in toward 1935 which in recent months has become increasingly sharp. In fifty-five large German cities (of 100,000 or more inhabitants), the only communities for which complete figures are available, some 215,000 marriages were contracted during 1935 as against some 252,000 in 1934, a decrease of around 14 per cent. The decline has tended to accelerate in the last few months; in December 1935 only some 18,000 marriages were contracted, about 22 per cent fewer, as compared with some 23,000 in December 1934. The decline in the birth rate is not yet so evident.

The mortality of the same urban population has shown an increase, 244,000 deaths in 1935 against 207,000 in 1934. Nevertheless the excess of births for the year 1935 is still greater than for 1934, although the number tended to decrease toward the close of the year.

Official morbidity and mortality statistics compiled by the police are available for the entire reich. In 1935 132,930 cases of diphtheria were recorded, 111,648 cases of scarlet fever, 1,328 cases of epidemic cerebrospinal meningitis and 2,080 cases of anterior epidemic poliomyelitis. All these diseases were more prevalent than in 1934. Of 60,368 cases of pulmonary tuberculosis reported, 32,587 proved fatal. Of the approximate 244,000 deaths in the fifty-five large cities, 14,577 resulted from tuberculosis, 16,196 from pneumonia and 11,429 from senile infirmities; there were also 6,007 suicides, 215 homicides and 6,052 accident fatalities.

#### Regulations for the Leasing of Pharmacies

\* According to a new order, all pharmacies independently engaged in meeting the demand for medicaments, that is, practically all excepting the hospital pharmacies, are to be classed as "public apothecaries' shops." No Jew may hereafter be a lessee of such an establishment, and if the owner of the pharmacy is a Jew he must rent it to a non-Jew. The orderly dispensing of drugs is considered jeopardized if an exorbitant rental is asked, if the landlord seeks for his own security to impose harsh terms on the lessee or if the lessee is under onerous obligations to a third party. The district leadership of the National Socialist party shall pass on the political reliability of the lessee. No person shall be considered eligible to operate a public pharmacy who has not been active as a pharma-

cist in Germany for at least three years subsequent to receiving his license. For pharmacists in cities of more than 50,000 inhabitants this prerequisite is set at ten years if in addition to the proprietor at least one other registered pharmacist is employed in the store.

#### Antityphoid Vaccination for Soldiers

The Associazione nazionale per l'igiene recently held an extraordinary session at the Scuola di sanità militare of Florence. Lieutenant Colonel Nicola Bruni, honorary professor of military hygiene in the school, reviewed the epidemiology of typhoid among soldiers. His data were compiled from statistics from several countries. The higher frequency of typhoid among soldiers, in comparison to civilians, depends on the age and living conditions of soldiers. The speaker stated, from the review of statistical data, that the efficacy of antityphoid vaccines is obvious. Discussion at present is concerned with the quality of the vaccine and with the technic of administration. Different vaccines are used by the armies of different countries. They are administered by either the parenteral or the oral route (vaccines in tablets). Vaccines with formaldehyde, the local and general reactions of which are insignificant, are used by the Italian army. He said that Castellani emphasized the importance of the use of polybacterial vaccines by associating antityphoid and anticholeric bacteria in the vaccine. He favors the preparation of tetrabacterial vaccine for workers and troops in East Africa. The bacteria for preparation of the vaccines should be carefully selected. The problem is important because recently performed research work seems to prove that the action of bacteria depends on the stage of its development. The speaker concluded that antityphoid vaccines are efficient against typhoid, provided the bacteria used in their preparation is well selected and the vaccination is repeated as it is necessary.

#### Meeting of Antituberculosis Society

The Federazione per la lotta contro la tubercolosi met in Palermo under the chairmanship of Professor Manfredi. Professor Luna of the University of Palermo spoke on the anatomy of pulmonary interlobar fissures. The pulmonary lobes may be perfectly cut off from one to the other by a deep fissure which begins and ends at different points of the hilus. In incomplete separation of the lobes, the fissures do not start at the hilus but in the pulmonary substance. The variations in the fissure of the right lung are more frequent than those in the left lung.

Dr. Fici spoke on late results of bilateral artificial pneumothorax. A patient who was treated for two years and considered as clinically cured died from an intercurrent non-tuberculous disease three years after discontinuation of collapse therapy. Necropsy proved that a clinical cure had taken place during the life of the patient. The speaker's case is the first one with this verification.

Dr. Gualdi spoke on the relation between gastric and pulmonary tuberculosis. He concluded from his observations that the normal stomach can stand the attack of tubercle bacilli without developing tuberculosis, but after a process of gastritis the secretory and motor functions of the organ are disturbed, the defenses of the gastric mucosa are diminished and the organ becomes a favorable terrain for the implantation of tubercle bacilli.

Dr. Bruno of Syracuse spoke on the pathogenesis of pleuritis during bilateral pneumothorax. The speaker found, in a large number of patients who had monolateral dry pneumothorax, that the establishment of a second contralateral pneumothorax is followed by the development of pleuritis in the side first

treated. The pleural exudate frequently disappears in a short time. The speaker discussed the pathogenesis of this form of pleuritis. He believes that the second collapsing treatment acts on the lung as a mechanical and allergic stimulation by which the equilibrium of organic defenses is disturbed. This results in a temporary activation of the pleural specific foci, which before the treatment were at rest.

#### Sickness Insurance in Austria

The following figures are taken from a social insurance report for 1935, which has just been published: Sick insurance societies to the number of sixty-three and having a membership of 1,620,000 were in existence as of 1935. Gross income amounted to 82,700,000 Austrian schillings (nearly \$17,000,000); expenditures totaled 83,900,000 schillings, so that there was a deficit in excess of 1,000,000 schillings (\$200,000). Disbursements are itemized as follows: sick indemnities, 23,000,000 schillings; physicians' honoraria, 15,000,000 schillings; hospital care, 9,000,000 schillings; medicaments, 5,000,000 schillings; dental treatment, 3,000,000 schillings; special treatment (physical therapy, roentgen therapy and so on), also 3,000,000 schillings; obstetric care, 2,000,000 schillings. At the close of 1935, 307,000 persons belonged to the workers' sick insurance societies, 600,000 persons, including many in industry, trade and commerce, were members of the private insurance societies and around 400,000 belonged to the governmental, railway and municipal insurance societies. The remaining insured persons were in independent callings and private corporations.

#### Injuries to Kidneys by Trauma

Before the Vienna Society of Physicians, Dr. Deuticke of the First Surgical Clinic discussed injuries to the kidneys by blunt objects or trauma. Such injuries are so rare that of 140,000 outpatients and 13,500 hospitalized patients received at the accident station in twenty years only seventy-nine cases came under observation. It is not always possible to distinguish immediately between a slight and a serious injury. In cases of incipient hemorrhage or intraperitoneal secondary injury, operation is indicated. In operations performed within the first twenty-four hours the transperitoneal approach would seem to be more favorable; in operations performed at a later time the lumbar approach is indicated. The more conservative procedure has won many adherents. Of the seventy-nine patients mentioned, only four were nephrectomized. The total mortality of the injured was 14 per cent. The after effects may be divided into three groups: (1) those caused directly by trauma, such as hydronephrosis from flexion or contraction of the kidney pelvis and from ureteral dysfunction; (2) effects indirectly imputable to the trauma and dependent on the constitution of the patient (tuberculosis and hypernephromas might result, but such cases are extremely rare), and (3) post-traumatic lithiasis and nephritis partly made possible by the trauma. The question of nephritis is still unanswered. It may be said that protracted excretion by the injured kidney of albumin and even of blood and cylindric casts can be regarded as practically without significance. Such excretion frequently results merely from local venous congestion. Damage to the sound kidney from serious injury to the other kidney is quite possible. Serious destruction of tissue accompanied by marked resorption of products from the splitting up of albumin often causes damage to the uriniferous tubules and brings on manifestations of nephritic disorders, which disappear, however, as the resorption of albumin ceases. So far as is known at present this condition results in no permanent injury. Whether or not a diffuse bilateral glomerulonephritis

can appear as a post-traumatic complication has not yet been reliably ascertained. However, a causal relationship between trauma and chronic nephritis should probably be assumed. After operative removal of a kidney subsequent to a trauma, complete function may be assumed by the remaining kidney, provided the latter organ is normal.

In three of thirty-four cases listed by the author in which follow-up examinations were made, complete destruction of the kidney due to after effects was observed. One of the three patients died of bilateral renal calculus; the other two presented, respectively, hydronephrosis due to scarry occlusion of the ureter and complete loss of function following primary operative tamponade. In all three cases severe hemorrhages occurred. These cases show, according to the author, how important an indication early nephrectomy may be under similar conditions. Conservative treatment involves the danger of chronic hemorrhage or infection, and the advantages to be obtained from such treatment are dubious. Acquaintance with the possible after effects of kidney injuries inflicted by dull force is of the utmost importance forensically in the adjudication of personal injury suits. Lithiasis such as might prove dangerous to life should be regarded as the most significant possibility.

#### Regulation of Blood Donors

In Vienna the employment of blood donors has been organized into a unified system with a central headquarters. A dozen or more donors are always on call at this center and may be sent to any point in the city at a moment's notice. The shift on duty in the call room is changed every twenty-four hours. In order that the supply of donors may suffice for public needs and that no single donor may be subjected to excessive demands, the following regulations have been issued by the Vienna Board of Health: Only those persons are accepted for blood transfusions who possess new blood donor identification cards issued by a magistrate. This card carries a photograph of the donor and sets forth his blood type, his number, and the amount of blood previously donated, with the date. In addition the card must show the date of the donor's last blood examination and the results of such examination. A list of professional blood donors possessing such identification is distributed among the hospitals of Vienna. This is kept down to date. After a successful transfusion an entry is made on the donor's card which, together with a memorandum, is sent in to the management of the Vienna General Hospital. This is in every case to be done by the operating surgeon or the institution and not by the donor himself. After a suitable interval the authorities of the General Hospital request that the donor undergo a hematologic examination. Only after this test has taken place will the donor's card be returned to him. In this way the donor is prevented from contributing his blood anew before a suitable regeneration has taken place. Remuneration for the donor's services is based on the economic circumstances of the donee. In cases involving hospital patients, the donor receives a minimum fee of 50 schillings for each transfusion; if the donee is a private patient the fee ranges from four to five times that amount.

#### Marriages

RAYMOND N. ALLEN, East Orange, N. J., to Miss Noeline Adele Davis of Orange, April 18.

ORLEN J. JOHNSON, Marshall, Mich., to Miss Audrey Merritt Locke of Detroit, March 29.

ELAN C. TOONE JR., Richmond, Va., to Miss Adelaide Salter of Anniston, Ala., April 11.

JOHN B. HAEERLIN JR., Chicago, to Miss Clare Rogerson of Montreal, Que., Canada.

EDWIN R. ANDERSON, Warren, Pa., to Miss Harriet Schindler in February.

#### Deaths

Michael Joseph Gallogly, Milwaukee; Wisconsin College of Physicians and Surgeons, Milwaukee, 1908; member of the State Medical Society of Wisconsin; formerly instructor in obstetrics, assistant professor of obstetrics and associate clinical professor of obstetrics and gynecology, Marquette University School of Medicine; aged 54; died, February 13, of cerebral hemorrhage.

Henry S. Gully, Meridian, Miss.; Louisville (Ky.) Medical College, 1885; member of the Mississippi State Medical Association; formerly professor of operative and traumatic surgery and clinical surgery, Mississippi Medical College; at one time medical superintendent of the Matty Hersee Hospital; aged 76; died in February of pneumonia.

Elias Wilbur Reed ♂ Holton, Kan.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1904; past president of the Jackson County Medical Society; for many years county health officer; formerly mayor, and member of the school board; aged 66; died, February 25, in the Christ's Hospital, Topeka, of pneumonia.

Arthur Jay Warren, Mount Clemens, Mich., Detroit College of Medicine, 1893; member of the Michigan State Medical Society; formerly secretary of the Macomb County Medical Society; served during the World War; aged 66; on the staff of St. Joseph's Hospital and Sanitarium, where he died, February 28, of carcinoma.

Stephen H. McDonald, St. John, N. B., Canada; McGill University Faculty of Medicine, Montreal, Que., 1903; past president of the New Brunswick Medical Society; formerly registrar and secretary of the Provincial Council of Physicians and Surgeons of New Brunswick; aged 57; died, February 4, of coronary thrombosis.

Francis Allen Wells, Lincoln, Neb.; Medical Department of Omaha University, 1901; served during the World War; aged 59; died, February 5, in the Bryan Memorial Hospital, of embolism of pulmonary artery and fracture of the left tibia, as the result of being struck by an automobile several weeks previously.

Virgil Henry Barton ♂ McAlester, Okla.; University of Nashville (Tenn.) Medical Department, 1900; past president of the Pittsburg County Medical Society; served during the World War; physician to the Oklahoma State Prison; aged 58; died, February 11, as a result of coronary thrombosis.

Walter Jay Richardson, Fairmont, Minn.; College of Physicians and Surgeons, Medical Department of Columbia College, New York, 1885; an Affiliate Fellow of the American Medical Association; aged 79; died, February 20, of spinal cord injuries following fracture of the spine eight months previously.

James Stanislaus Walton ♂ Amsterdam, N. Y.; Niagara University Medical Department, Buffalo, 1896; district state health officer; at one time health officer of Amsterdam; formerly on the staff of the Montgomery Sanatorium; aged 66; died, February 18, of coronary thrombosis.

Clarence Edward Strite ♂ Surg., Lieut. Commander, U. S. Navy, retired, San Diego, Calif.; Baltimore Medical College, 1902; entered the Navy in 1904 and retired in 1918 for incapacity resulting from an incident of service; aged 58; died, February 28, of arteriosclerosis and heart disease.

Hubert Daniel Brennan, Bristol, Conn.; University of Vermont College of Medicine, Burlington, 1892; member of the Connecticut State Medical Society; on the staff of the Bristol Hospital; aged 71; died, February 27, of hypernephroma of the kidney.

Frank Richard Herriman, New York; Long Island College Hospital, Brooklyn, 1902; formerly assistant professor of otolaryngology, New York Post-Graduate Medical School of Columbia University; served during the World War; aged 58; died, April 4.

Alexander Frank Thompson ♂ Troy, N. C.; Medical College of Indiana, Indianapolis, 1895; past president of the Montgomery County Medical Society; aged 65; died, February 16, in a hospital at Charlotte, of injuries received in an automobile accident.

Charles Francis Talley ♂ Powell, Ohio; Miami Medical College, Cincinnati, 1886; for four years a member of the state legislature; past president of the county board of health; aged 71; died, February 8, of myelogenous leukemia and diabetes mellitus.

**Julia Kimball Qua**, Galesburg, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1900; formerly on the staffs of the City and St. Mary's hospitals, Amsterdam, N. Y.; aged 73; died, February 1, of cerebral arteriosclerosis.

**George C. Wagner**, Tacoma, Wash.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1881; member of the Washington State Medical Association; aged 76; died, February 25, of carotid aneurysm, cerebral emboli and partial hemiplegia.

**Carl Anton Schau Gundersen**, Madison, Wis.; Bennett Medical College, Chicago, 1912; member of the State Medical Society of Wisconsin; served during the World War; aged 55; died, February 19, of bronchopneumonia and malignant hypertension.

**George Ward Rockwell**, Akron, Ohio; University of Pennsylvania Department of Medicine, Philadelphia, 1912; member of the Ohio State Medical Association; aged 58; died, February 25, of uremia, arteriosclerosis and perforation of the ileum.

**Andre Leopold Stapler** @ Chicago; Chicago College of Medicine and Surgery, 1912; at one time assistant in surgery at his alma mater; on the staffs of the Augustana and Grant hospitals; aged 53; died, February 6, of coronary thrombosis.

**Charles A. Prevost** @ St. Johnsbury, Vt.; Victoria University Medical Department, Coburg, Ont., 1891; on the staff of the Brightlook Hospital; aged 73; died, February 26, in Rockaway, N. J., of chronic myocarditis and pneumonia.

**Charles F. Green**, Detroit; Howard University College of Medicine, Washington, D. C., 1904; aged 55; on the courtesy staff of St. Joseph's Mercy Hospital, where he died, February 26, of acute dilatation of the heart and influenza.

**Frank F. Petty**, Lawrenceville, Ill.; Hospital College of Medicine, Louisville, Ky., 1902; member of the Illinois State Medical Society; aged 64; died, February 19, in the Good Samaritan Hospital, Vincennes, Ind., of pneumonia.

**Benjamin Franklin Wentworth**, Scarborough, Maine; Medical School of Maine, Portland, 1897; for many years superintendent of schools in Scarborough, and health officer; aged 64; died, February 20, of arteriosclerosis and bronchopneumonia.

**Leslie George Taylor**, Hudson, N. Y.; Baltimore Medical College, 1895; member of the Medical Society of the State of New York; served during the World War; aged 61; died, February 27, of arteriosclerotic heart disease.

**Albert Gus Shauck**, Arlington, Ind.; Medical College of Indiana, Indianapolis, 1905; member of the Indiana State Medical Association; formerly county coroner; aged 57; died, February 24, of carcinoma of the stomach.

**Willcox Ruffin** @ Norfolk, Va.; University of Virginia Department of Medicine, Charlottesville, 1926; aged 35; on the staff of the Norfolk Protestant Hospital, where he died, February 28, of an accidental gunshot wound.

**James Joseph Loughran**, Brooklyn; Jefferson Medical College of Philadelphia, 1909; since 1926 associated with the psychiatric division of the Department of Hospitals; aged 51; died, February 11, of coronary sclerosis.

**James Wallace Skinner**, Genoa, N. Y. (licensed in New York in 1878); member of the Medical Society of the State of New York; aged 82; died, February 25, of cerebral arteriosclerosis and acute glomerular nephritis.

**William E. Talbott**, Harrisville, W. Va.; College of Physicians and Surgeons, Baltimore, 1880; aged 77; died, February 3, in St. Joseph's Hospital, Parkersburg, of complications due to a fractured hip received in a fall.

**Frederick Willard Rogers**, Alma, Mich.; Chicago Medical College, 1886; member of the Michigan State Medical Society; aged 75; died, February 19, in the Michigan Masonic Home and Hospital, of heart disease.

**Joseph Francis Quin**, Milwaukee; Milwaukee Medical College, 1905; aged 68; died, February 21, in the Milwaukee County Hospital, Wauwatosa, of portal cirrhosis of the liver, diabetes mellitus and arteriosclerosis.

**Morris C. Tuholske** @ Akron, Ohio; Washington University School of Medicine, St. Louis, 1903; school physician; member of the staff of the People's Hospital; aged 57; died, February 26, of myocarditis.

**Henry Otto Feiss** @ Cleveland; Harvard University Medical School, Boston, 1902; served during the World War; aged 59; died, February 20, in the Mount Sinai Hospital, of acute furunculosis and pneumonia.

**Peter Eckel Walker**, Gallatin, Tenn.; Bellevue Hospital Medical College, New York, 1871; Civil War veteran; aged 92; died, February 28, in the City View Sanitarium, Nashville, of bronchopneumonia.

**William Lowell Thurman**, Chicago; Meharry Medical College, Nashville, Tenn., 1920; aged 53; died, February 14, in the Provident Hospital, of acute suppurative sinusitis and cervical cellulitis.

**Arthur Warren Selleck**, Roscoe, N. Y.; New York Homeopathic Medical College and Flower Hospital, New York, 1913; health officer and school physician; aged 50; died, February 21, of pneumonia.

**Thomas Wister Edmunds**, Danville, Va.; College of Physicians and Surgeons, Baltimore, 1907; aged 50; died, February 1, in the Morton F. Plant Hospital, Clearwater, Fla., of pneumonia.

**Edward Stephen Hayes**, Portland, Ore.; Harvard University Medical School, Boston, 1881; for many years a member of the Wisconsin State Board of Health; aged 79; died, February 11.

**Walter G. Day**, Feesburg, Ohio; Eclectic Medical Institute, Cincinnati, 1892; aged 67; died, February 28, of gastric carcinoma.

**John W. McCready**, Augusta, Mont.; Detroit College of Medicine, 1898; aged 71; died, February 17, of angina pectoris.

**Benjamin Apple**, San Francisco; Cooper Medical College, San Francisco, 1893; aged 64; died, February 1.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### FORMULA FOR SKIN PEEL

To the Editor:—Will you kindly give me the formula of a good skin peel. Please omit name.

M.D., New York.

ANSWER.—There is no perfectly satisfactory and absolutely harmless method of causing the skin to peel. Any method may cause too great a reaction with uncomfortable inflammation and slow recovery, and at times some cause increased pigmentation as an after-effect. For small areas carbon dioxide snow is one of the most accurately controllable methods; a few seconds' pressure will cause the formation of bullae. It has the disadvantage of making a sharply defined mark and, if too vigorously used, a scar. In babies and old persons it must be used with great caution.

Painting a small area with lactic acid, from 5 to 20 per cent in water, once a day for several days will cause an inflammatory reaction followed by exfoliation. The use of ultraviolet rays is one of the controllable methods of causing exfoliation. The sensitivity of the skin must be known and the lamp warmed up a definite time before exposure in order to get the proper reaction. The great drawback to this and other methods is the resultant tanning or freckling, and if peeling is employed to remove pigment this is evidently unpractical.

For removal of pigment, mercury solutions are commonly used. The bichloride is used most frequently. The following is a formula of Dr. White given by O. S. Ormsby (*Diseases of the Skin*, ed. 4, Philadelphia, Lea and Febiger, 1934, p. 592):

	Gm. or Cc.
Mercury bichloride .....	0.4
Diluted hydrochloric acid.....	4.0
Glycerin .....	30.0
Alcohol .....	60.0
Rose water .....	60.0
Distilled water .....	120.0

This is to be dabbed on and allowed to dry at night and washed off in the morning. Any such application should be first tried on a small area to gauge its effect on the skin to be treated, for there is a great variation in the way different skins react. There should of course be a poison label on the bottle. If the test application causes a prompt inflammatory reaction, the formula is too strong and is apt to be followed by pigmentation. The effect desired is a mild inflammation coming on after a week or more.

The following is a nonmercurial preparation also suggested by White:

	Gm. or Cc.
Ammonium chloride .....	2.0
Cologne water .....	30.0
Distilled water .....	240.0

This should be tested in the same way, for some skins become pigmented after an inflammatory reaction caused by the oil of bergamot in a certain kind of cologne water. Another perfume may be used in its place.

For the rapid removal of lesions of acne vulgaris, peeling pastes are used. One of the best is the following: (from Kren, O., *Kosmetische Winke*, Berlin and Vienna, Julius Springer, 1930, p. 25):

	Gm. or Cc.
Beta-naphthol .....	10.0
Flowers of sulfur.....	40.0
Green soap .....	25.0
Liquid petrolatum .....	25.0

This will darken to brown because of the oxidation of the beta-naphthol, but that does not interfere with its action. Only those with intact kidneys should be subjected to this treatment, for there may be absorption. Also it must not be applied to the whole face at once but to the cheeks and chin at one time and to the forehead and nose at another, to avoid a toxic reaction.

The skin should be cleansed with benzene or ether and then the paste is spread in a thick layer over the affected part. The clothing must be protected to avoid spotting. At first there is a burning sensation, which passes off soon. At the end of twenty or thirty minutes the paste is removed. The skin is red, but in a few hours it resumes its normal color. The application should be repeated every twelve hours or twenty-four hours until there remains a tightness of the skin or beginning exfoliation. The skin must not be washed with soap and water

at this time but may be gently cleansed with 0.5 salicylic acid in alcohol. After the treatment ceases, the salicylic alcohol should be continued, followed by powder. If the treatment has been kept up five days, at least three or four will be necessary before peeling is over. During the treatment the urine must be examined and treatment should be stopped at once if albumin is found.

Such treatment is seldom used in this country, for it is difficult to control it exactly. At the best it takes more than a week, and there is always a possibility of too violent a reaction, a severely painful reaction and possibly pigmentation as a sequel. To obtain satisfactory results, it may have to be repeated.

### RECURRENT ULCERS OF MOUTH

To the Editor:—I have a patient who has recurrent ulcers in her mouth. They began to appear several years ago and have continued to occur at intervals of from two to three weeks until the present time. They appear in any portion of the mouth but are more frequent on the cheek, gums and side of the tongue. They require several days to reach their maximum size, remain for three or four days, and often require about five days to disappear. The ulcers are superficial, apparently involving only the mucous membrane. They are rarely larger than a millimeter in diameter, are smooth and have a whitish base. The patient says that they occur more frequently when she is fatigued. They also appear after eating more sweets than usual and she can depend on having the ulcers if she takes an alcoholic drink of any description. For the last two or three months they have been associated with a dull frontal headache. The time of occurrence is in no way related to the menstrual periods. Except for the ulcers and headache she is in good health. The bowels are regular. She takes a purgative when she has a headache but it does not seem to affect the headache or the ulcers. She does not have attacks of diarrhea, and she never suffers from gaseous indigestion. She has no sour eructation or heartburn. The respiratory, cardiac, menstrual and urinary histories are negative. The patient is a white woman, aged 26, and appears well nourished and in good health. She is slightly overweight. Her blood pressure, pulse and urine are normal. The Kahn test is negative. She is slightly anemic; the hemoglobin (Sahl) is 80 per cent. The basal metabolism, gastric analysis and stool analysis are normal. Repeated examinations of scrapings from the ulcers fail to reveal evidence of Vincent's infection. Examination of the mouth reveals excellent oral hygiene, numerous alloy fillings of the teeth, and one gold filling. There is no evidence of inflammation of the gums or of abscessed teeth. The tonsils have been removed. The general physical examination reveals no abnormalities. The patient has taken a low carbohydrate diet without any apparent results. She has taken Citro-carbonate without any apparent beneficial results. She has tried sodium perborate as a mouth wash and lozenges of potassium chlorate, without results. I should like to know the probable cause of the ulcers and the best treatment for them. Do you think the skin sensitization test with various food elements would be of any help in determining the cause? Is it possible that the alloy fillings of the teeth could be in any way responsible for the ulcers? Please omit name.

M.D., Alabama.

ANSWER.—The causes of ulcers of the oral cavity mucosa are multiple. The correspondent seems to have ruled out many, such as gastro-intestinal dysfunction, fungus infection, pyorrheal infection, reflex menstrual shock and pernicious anemia. There has not been ruled out the possibility of one of several skin diseases which are sometimes also manifest on the oral mucosa; namely, herpes simplex, pemphigus, lichen planus, lupus erythematosus and erythema multiforme.

However, there still remains the possibility of (1) food sensitization, (2) laxative drugs which contain phenolphthalein, or other well known chemicals to which many patients are sensitive (Shel mire, J. B.: *Certain Diseases of the Oral Mucous Membrane and Vermilion Borders of the Lips*, *South. M. J.* 21:169 [March] 1928) and (3) the possibility of electrogalvanism with deposition of ionized toxic metals contained in the dental fillings into the oral mucosa (Lain, E. S.: *Electro-galvanic Lesions of the Oral Cavity Produced by Metallic Dentures*, *THE JOURNAL*, March 11, 1933, p. 717; *Electro-galvanic Phenomena in the Oral Cavity*, *Dental Digest*, June 1934).

Scratch tests for food sensitization have been disappointing in many respects. Food tests by the elimination method seem to be the most popular at the present time.

Since the patient has multiple dissimilar metallic fillings, which always consists of from three to five different metals each, she doubtless has a perceptible galvanic battery present, regardless of the  $pH$  of the saliva. Of course, the  $pH$  of saliva varies with the change in diet and hence might affect the degree of current.

It has been proved, and many case reports are now available, that ulcers of the mouth may sometimes be cured by a removal of dissimilar metallic dentures.

If the correspondent can enlist the services of an electrical engineer with his delicate micro-ammeter or galvanometer, usually courteously furnished by the public telephone or electric power corporations, he probably can determine the possibility of electrogalvanism as the cause of the patient's stomatitis.

It has not yet been determined just what degree of current or length of time is necessary to produce such electrogalvanic lesions. Personal sensitivity to certain metals also may play an important part.

#### PRIMARY CARCINOMA OF LUNG

To the Editor—Reference is made to your book review on page 1709 of the Nov. 23, 1935, issue of THE JOURNAL where, in the fourth paragraph of the review of J. Arthur Myers' "Diseases of the Chest," the statement is made that primary carcinoma of the lung ranks today only second to gastro-intestinal malignancy in frequency. Further confirmatory information on this subject will be appreciated, especially in view of the statement made by Dr. Ewing in his most recent edition of "Neoplastic Diseases" that primary carcinomas of the lung account for only 1 per cent of all carcinomas (page 851, third edition). The latest edition of Stevens' "Textbook of Medicine" gives the total percentage of primary carcinoma of the lung as 5. The latest edition of Norris and Landis' "Diseases of the Chest" in quoting statistics from many different investigators gives 10 per cent as about the highest figure. Your comments on this subject will be appreciated.

S. C. KARLSTROM, M.D., Bath, N. Y.

ANSWER.—Primary carcinoma of the lung is much more frequent than the textbooks on medicine now state. Unfortunately the subject has not been given sufficient consideration, because the proportion of cases diagnosed during life was only 5 per cent twenty years ago. At present about 50 per cent are recognized in large clinics. The clinician who is familiar with the pathologic and clinical manifestations can recognize most cases from the history, physical examination and roentgen study. A bronchoscopic examination with bronchography is of great value in diagnosis.

Arkin and Wagner (THE JOURNAL, February 22, p. 587) state that primary lung cancer constitutes from 6 to 8 per cent of all carcinomas. They report 135 cases observed in four years and present the important clinical, pathologic and roentgen observations. Many German and Austrian pathologists have reported from 6 to 14 per cent of all carcinomas as primary in the lung. Dr. Richard Jaffé at the Cook County Hospital in Chicago found 724 carcinomas in 5,400 necropsies over a period of five years. Of these 724 cases of cancer, eighty-seven were primary lung carcinomas, making 12 per cent of the cases of carcinoma. Carcinoma of the stomach led, with 22 per cent.

Ewing's book on "Neoplastic Diseases" gives a much too low percentage for carcinoma of the lung, and the statement that only 1 per cent are primary in the lung will undoubtedly be revised in the next edition. Most textbooks on medicine, and some on diseases of the chest, will soon be obliged to do justice to this important subject. The great variability in the clinical manifestations still leads to frequent erroneous diagnoses, and too many physicians still look on primary lung cancer as a rare disease. The paper by Arkin and Wagner cites a number of references giving the frequency of lung carcinoma in various pathologic institutes.

#### OCCUPATIONAL HAZARDS IN BAKING INDUSTRY

To the Editor—I have noticed that a good many bakers have a rather pale, sallow, anemic appearance. I have had two patients who, after working in a bakery for a year or two, took on this peculiar appearance and lost considerable weight, although they had no specific complaints. Physical examination, blood count and urinalysis gave normal results. I have thought their condition was probably due to night work with irregular hours of sleeping and eating, or perhaps to inhalation of flour dust. Is there a tendency for occupational disease peculiar to the baking profession?

CHARLES D. WOOD, M.D., Lewistown, Mont.

ANSWER.—The modern baking industry suffers from a poor heredity. In times past justification existed for characterizing this trade as truly dangerous. The rates for pneumonia and tuberculosis were disproportionately high, skin diseases were prevalent, and "bakers' asthma" was well known to bakers and millers. The anemia of bakers was proverbial. Orthopedic conditions were so numerous that at least in foreign countries bakers' apprentices were rarely usable for full military services. In the causation of these unwanted conditions, responsibility must be placed not so much on specific hazards as on the general lack of sanitation in bakeries in olden times. High temperatures, associated with high humidity, created undue fatigue. Long hours of work and particularly work at night exacted a toll. Animal and vegetable parasites were so extensively present in bakeries as to make "bakers' itch" almost continually epidemic. Carbon monoxide from unsuited types of ovens constituted a common hazard. Wherever these conditions still persist, they serve as some proof of the lack of modern sanitation in the bakery industry. At the present time "bakers' itch" arises occasionally but is rarely epidemic. "Bakers' itch" is perhaps not one disease but several. The

chief causes are the bleaches introduced by millers into flours, sensitization to flour itself, and mycotic organisms chiefly derived from flour, but possibly spread from worker to worker. Bakers' anemia likewise is encountered from time to time, usually in proportion to the lack of modernness in the bakery. No precise cause has been found for this anemia and at times the condition constitutes a pallor without diminution in the cellular elements of the blood beyond normal limits. This pallor, which is nearly always accompanied by increased susceptibility to pyogenic infections and gastro-intestinal disorders, has been associated by some with mycotic disorders of the lungs, by others with exposure to high temperatures, and by still others to lack of personal cleanliness in removing the sugars, flours or salts from the skin. Flour dust is not responsible for any disease analogous to silicosis but it may be held responsible for low grade irritation of the eyes and respiratory tract. Millers' asthma or bakers' asthma may represent a sensitization to flour dust. All in all, the modern bakery must be extended credit for having eliminated many of its earlier objectionable work conditions, practices and materials.

#### INFECTIOUS ADENITIS OR MONONUCLEOSIS

To the Editor—A patient became ill, Oct. 1, 1935, with chilly sensations and a slight fever associated with loss of appetite. This phase lasted for a few days, when he nearly collapsed. He went home and to bed for the first time. The condition did not improve and he had three distinct chills at irregular intervals, one of which occurred during the night. His temperature was erratic but the peaks gradually became higher. During this period he developed a cough, which too became gradually worse. With this feeling of malaise, irregular temperature, rising to 104 at one time, cough and râles at the base of his right lung, the condition was diagnosed as influenza with a complicating bronchopneumonia at the right base. October 8 he was admitted to the hospital acutely ill with this sequence of symptoms. A complete blood count at this time showed white blood cells 5,000, red blood cells 4,890,000, hemoglobin 90 per cent, polymorphonuclears 70 per cent, eosinophils 1 per cent, transitionals 2 per cent, and lymphocytes 27 per cent. Agglutination tests for Brill's disease, undulant fever and typhoid were negative. The sedimentation rate was 60 minutes, 1 mm. No malaria was discovered. There was a faint trace of albumin in the urine. After seven days the irregular remittent fever began to intermit, ranging from 98 to 100 F. This variation with a morning subnormal temperature and an afternoon rise to 100 still continues. October 10 another blood count showed white blood cells 6,800, red blood cells 4,720,000, hemoglobin 86 per cent (Dare), polymorphonuclears, 71 per cent, transitionals 3 per cent, lymphocytes 26 per cent. The examination for malaria plasmodia was still negative. On or about October 22 he became aware of the presence of enlarged glands in the posterior cervical chain, the epitrochlear glands and both inguinal chains. There were no glands palpable in the anterior cervical chains, though the area was tender on both sides. These glands were enlarged, movable and tender. The manifestation was not accompanied by any pronounced febrile exacerbation. Though he was conscious of their presence, there was no spasticity of the muscle swelling nor any marked degree of discomfort. October 20 the blood examination showed white blood cells 12,700, hemoglobin 85 per cent, polymorphonuclears 64 per cent, eosinophils 1 per cent, transitional 3 per cent, lymphocytes 32 per cent. October 25 the blood picture showed white blood cells 14,600, red blood cells, 4,850,000, hemoglobin 84 per cent, polymorphonuclears 35 per cent, eosinophils 1 per cent, monocytes 6 per cent and lymphocytes 58 per cent. The notation of the technician calls attention to the slight leukocytosis and decreased polymorphonuclears. The lymphocytes and mononuclear cells totaled 64 per cent. Lymphoblasts were present. The laboratory conclusions suggested infectious mononucleosis in a rather early stage. The agglutination test for undulant fever was slightly positive, 1:20 plus, 1:80 negative. The typhoid test, 1:20, was very slightly positive (the patient has been vaccinated for typhoid several times). Physical examination reveals enlarged, movable, tender glands in the stated areas, no spasticity of the muscles, no marked rise of temperature, no pronounced discomfort and no perceptible enlargement of the liver, nor is the spleen palpable. The man is in his early forties. With this history before you, can you venture a diagnosis? Is this an adenitis complicating influenza or is it an infectious mononucleosis?

M. D., Georgia.

ANSWER.—From the facts stated, the most likely diagnosis is a postinfectious adenitis and lymphocytosis. The history, clinical course and blood counts do not suggest an infectious mononucleosis. If, in the presence of a lymphocytosis, the question of infectious mononucleosis arises, the test for the presence of heterophile antibodies should be done. The finding of an elevated titer of agglutinins for sheep red cells in a person who has not recently received an injection of horse serum indicates with a high degree of probability the presence of infectious mononucleosis. A titer in excess of 1:160 should be considered as a positive reaction. The test is positive in some cases for months after the abnormal lymphocytes disappear.

If the correspondent is interested in performing the test the recent modification of Davidsohn is advised, as it is quicker and more sensitive than the other technics (*Am. J. Dis. Child.* 49:1222 [May] 1935).

## PERSISTENT SCROTAL DERMATITIS

*To the Editor:*—I would appreciate any advice you can give me as to diagnosis and therapy in the case of a man, aged 55, single, who has had in the past few years recurrent attacks of itching, burning, fissuring and desquamation of the scrotum. Occasionally he also has recurrent attacks of dryness, fissuring and desquamation of the finger tips, which has responded to the usual squamous eczema treatment, but the scrotum has not improved under this treatment. He also has occasional attacks of vertigo, gastro-intestinal disturbances and headache. There is no constipation and no indigestion after eating. Kindly omit name.

M.D., Pennsylvania.

**ANSWER.**—Recurrent attacks of dermatitis, as described, may be of fungous origin associated with tinea involvement of the groin, feet or hands. It may also be of constitutional origin associated with diabetes or nephritis. If careful examination rules out any of these as etiologic agents, the condition would fall into the eczema group, and consideration must be given to allergic causes, a seborrheic background or an underlying neurogenic factor.

The association of fissuring and desquamation of the finger tips may be on a tinea basis, the hands being involved with a toxic dermaphytid secondary to a tinea infection of the scrotum, groin or feet.

After specific treatment of any known etiologic factor, local soothing therapy to the affected parts should be employed. The use of bland ointments, 3 per cent crude coal tar ointment, 1 per cent phenol in lotion or bland ointment, and solution of aluminum subacetate, 1 to 16, as wet dressings are advised. Occasional fractional doses (50 roentgens) of x-rays at weekly or biweekly intervals can be employed, if local therapy is of no avail. This, however, must be used with great caution and full realization that x-rays in the scrotal area may have the effect of producing sterility. The internal administration of calcium, fortified by sedatives, for a short period is also of value in the obstinate cases.

## LATENT INFECTION AS CAUSE OF SEPSIS

*To the Editor:*—I believe that many deaths due to septicemia post partum are perhaps due to "benign" septic abortions (illegal) incurred prior to the fatal conception. I mean that perhaps an illegal abortion that was apparently aseptic is the cause of the instillation of an avirulent focus which lies dormant and then later owing to lowered resistance in the progress of a normal labor "flares up" and becomes virulent, resulting in septicemia and death regardless of the most rigid aseptic technic in the conduct of the fatal labor. I have never had a case of septicemia and hope I never do. It is my conviction that a doctor with intelligent technic delivering in the home or the hospital is rarely if ever the primary cause of septicemia in labor. It would be interesting to know what percentages of cases of maternal mortality due to septicemia incurred in hospitals had an antecedent history of abortion prior to the fatal conception.

MICHAEL SMITH, M.D., Gilbertsville, N. Y.

**ANSWER.**—Many thoughtful obstetricians have entertained the same idea that an infection can remain latent in the genitalia for many years after its reception. The gonococcus dies off quickly, in four or five months, but the streptococcus can persist in the tubes and in the broad ligaments for years.

In medicolegal cases such knowledge is important, and without a doubt these latent infections can bring on serious complications after any local intervention such as therapeutic abortion, diagnostic curettage, cesarean section with or without sterilization, or even normal labor. Fortunately such cases are rare, and in the majority of instances in which infection has resulted from intervention or natural delivery some extraneous cause is usually operative.

## EXCESSIVE GROWTH IN INFANTS—PINK DISCOLORATION OF STOOLS

*To the Editor:*—1. A male baby that weighed 8 pounds (3.6 Kg.) at birth weighed 16 pounds (7.3 Kg.) when 9 weeks old. It is well proportioned and breast fed. Can you give me information relative to rapidly growing babies, cause and treatment? There is no evidence of pathologic conditions in either parent or child. 2. What would cause a pink staining of the diapers from bowel movements of a baby who suffers from colic? Please omit name.

M.D., Nebraska.

**ANSWER.**—1. It is difficult to account for rapid growth in infants. Sometimes perfectly normal babies take on an accelerated growth and frequently develop to be persons of large stature. This may depend on endocrine function, which may be very active, though within normal physiologic limits. On the other hand, there may be an abnormality in the function or structure of the pituitary gland. In such a case one would expect to find concomitant symptoms arising from that gland, such as acromegalic manifestations in the upper or lower extremities, or in the formation of the jaw, or marked polyuria.

If the child presented the abnormal condition known as gigantism, one would observe rapid increase in the growth of the skeleton with a corresponding delay in ossification. These patients also show muscular weakness and more or less failure of mental development. They may show some benign or malignant new growth of the pituitary gland.

2. A pink discoloration of the stools is sometimes due to the presence of urates in the urine, which give a pink color around the margin of the stool. The color may sometimes be caused by an oxidation process of the bile salts. There may be no association between the pink stools and the colic. On the other hand, it is conceivable that an infant who is passing a considerable quantity of urates may be suffering from irritation or pain that originates in the urinary organs.

## BURNS FROM MERCURY OINTMENT

*To the Editor:*—May 21 a patient stated that she had put on her skin some ammoniated mercury for a skin rash (scabies), which a druggist told her would cure the itch. Almost at once, she stated, it began to burn and before she could remove the ointment she was severely burned. On examination I found a second degree burn over the entire abdomen, both breasts and right shoulder and a first degree burn on both arms and hands. The patient is now bringing a lawsuit against the chain drug company for damages. I tested the patient with ammoniated mercury, using a standardized preparation from Parke, Davis & Co. This produced no ill effects on her skin. This, I feel, ruled out her idiosyncrasy to ammoniated mercury. Now the question in court is Can ammoniated mercury produce this burn? Is it possible for this drug to break down and give a mercury burn? Or what explanation can be given for this burn?

M.D., Ohio.

**ANSWER.**—The failure of reaction in a patch test, or even several patch tests, does not entirely rule out sensitization to the material tested. The sensitization may be localized, or it may increase or decrease with variations in the general condition of the patient. It does, however, have some weight against sensitization. That is, it would be a rare case of widespread sensitization of any great degree that would fail to react if tested several times.

Hypersensitivity to ammoniated mercury is not uncommon. Theoretically, an ammoniated mercury ointment might become more irritating on aging from the formation of fatty acids in the menstruum or from other chemical changes. No experimental or clinical evidence has been found in favor of this theory. Light also affects ammoniated mercury, but the mixture in ointment would probably prevent any such reaction.

A familiar cause of burns from ammoniated mercury is the preceding use of tincture of iodine. This may produce a violent dermatitis. The latter occurs frequently in the experience of dermatologists. Tincture of iodine followed by ammoniated mercury ointment has been used therapeutically over small areas in the treatment of lupus erythematosus when considerable local irritation is desired.

The druggist should be condemned for counter prescribing. In giving a patient ammoniated mercury ointment as treatment for the itch he exposed her to a much greater injury than the burn mentioned. There are in the literature records of a number of fatal cases of mercury poisoning caused by the recommendation by ignorant persons of the use of mercurial ointments for the treatment of scabies.

## PATCH TESTS IN IVY POISONING

*To the Editor:*—I am located in the Middle West where there is constant trouble from dermatitis of vegetable origin. Poison ivy, poison oak and other vegetation cause dermatitis. My difficulty is a differential diagnosis of the type. Is there any way of differentiating between the types? The proper diagnosis is very essential in the type of treatment and the results obtained.

ROBERT H. KERR, M.D., Alman, Neb.

**ANSWER.**—The most practical way in which to determine the offending plants probably would be by means of patch tests. A patch test is made by applying a small square of gauze containing some of the leaf on an area of thin, nonhairy skin, and of course an area showing no evidence of inflammation. The skin of the arm or the chest is usually suitable for testing. The square of gauze is then covered with waxed paper, cellophane, oiled silk or gutta percha and fastened to the skin with adhesive tape. It is held in place for twenty-four hours or, if the patient feels no discomfort, for forty-eight hours. The site is then examined for evidence of inflammation. If there is such evidence it usually indicates that the substance in the patch is the source of the trouble. It has been noted in some cases that the skin will not react if the test is made on an area that has never been affected, although it may be positive if the test is performed on an area that was formerly affected; i. e., a local hypersensitiveness has developed. And also it might be well to perform control tests with the covering substance and the

adhesive plaster, although it is seldom necessary because irritation from these sources is usually obvious. Of course, each of the suspected plants should be tested separately. The treatment, except for prophylactic treatment, would be the same regardless of what plant was at fault.

#### TREATMENT OF UTERINE FIBROIDS

*To the Editor:*—A woman, aged 43, has a fibroid uterus the size of a fourth month gestation. There are no symptoms of pressure or menstrual disturbance. The menses are regular and of the usual periodicity and duration. The condition was noted by chance during a routine examination. What procedure of treatment should be adopted—x-ray, surgery or "let alone"? What are the chances of shrinkage accompanying the involutionary changes at the menopause? Kindly omit name.

M.D., New York.

**ANSWER.**—The great majority of women with symptomless tumors of modest size do well with palliation. Unfortunately, a modest percentage develop serious complications. For example, even in capable hands a malignant growth sometimes escapes detection under the guise of simple tumors. In many instances also the growth is adenomyomatous and predisposed to develop malignant changes.

In the case at hand, the patient having attained the age of 43, surgical intervention is not urgently indicated, although it is probably preferable to palliative care or irradiation.

Roentgen and radium therapy are usually reserved for bleeding tumors; these should be not larger than the size of a four months pregnancy and the patient well beyond 40 years of age, preferably near the menopause. A diagnostic curettage should always precede their irradiation to rule out the possibility of a malignant condition.

One is warranted in assuming that fibroids will not enlarge greatly in a patient at or near the menopause, but decrease in the size of the tumors is usually not evident until later.

#### USE OF OPERATING ROOM FOR PERFORATION IN TYPHOID

*To the Editor:*—Question came up at the staff meeting about using the operating room for perforation in typhoid cases. Part of the staff members were in favor and part were against taking this patient to the operating room. Also would there be any particular kind of disinfecting of the operating room other than would be used in ordinary pus cases? This is a fifty-bed hospital.

GEORGE W. WOOD, M.D., Carthage, Mo.

**ANSWER.**—The precautions in the transportation and surgical preparation of a typhoid patient would be similar to those of one with a pyogenic infection or with a chronic active infection such as tuberculosis.

The secretions or discharges must always be protected, while in typhoid one must consider in addition that the urine and feces are infected.

Similar disinfection and disposal of all linen and materials with recognized cleanliness and use of antiseptics by the personnel handling the patient are equally satisfactory.

In some hospitals, separate operating rooms are used for clean and for infected cases. Even then it is not always possible to segregate them.

Care is generally taken that no operation in a clean case be performed following any operation in a case of infection until the entire operating room has been cleaned and all instruments and linen removed and changed, regardless of whether they have been used.

#### DIATONE—AN ALLEGED INSULIN SUBSTITUTE

*To the Editor:*—I have just received a sample lot of tablets labeled Diatone, put out by Diabetic Diatone, Inc., 765 Oakwood Boulevard, Chicago. It is stated to be a colloidal preparation of uranium and, it is claimed, will take the place of insulin in the control of diabetes. They claim that in producing uranium in a colloidal form they thereby remove the toxic qualities of uranium. I have found in Merck's Index that nitrate of uranium has been used as an antidiabetic remedy and from the same source learn that uranium is quite toxic. Can you give me any information on this preparation called Diatone?

M.D., New York.

**ANSWER.**—According to the advertising literature in the files of the Council on Pharmacy and Chemistry, Diatone is claimed to contain in each 5 grain tablet "1 grain of colloidal uranium, together with whole pancreatic substance (which is employed simply as an intestinal digestant and not as a hormone substitute) together with other [sic] excipients." Diatone is proposed by the firm for oral administration in the treatment of diabetes.

As yet there is no preparation for oral use that can adequately substitute for insulin in the therapy of diabetes. Diatone, if it contains the amount of uranium that the firm claims it does,

must be classed as a dangerous preparation. According to Sollmann (Manual of Pharmacology, ed. 4, Philadelphia, W. B. Saunders Company, 1932) "the soluble uranium nitrate has been used in diabetes mellitus and phthisis in doses of . . . 1 gr. . . largely diluted. The results are too indefinite to justify the further employment of so dangerous an agent." Sollmann states further that uranium "salts are very corrosive, consequently readily absorbed, and highly toxic. Their systemic effects are similar to other metals, with a special paralytic effect on respiration; this resembles cyanide poisoning superficially. They produce a characteristic nephritis; glycosuria: and a unique edema."

While the exact nature of the uranium in Diatone is not clear, even if this is in the form of the metal or of one of the relatively insoluble uranium compounds, such as the oxide, enough uranium may nevertheless be absorbed, through the solvent action of the hydrochloric acid of the gastric juice, to produce serious systemic poisoning.

#### RECURRENT ABDOMINAL PAIN

*To the Editor:*—I would appreciate your advice concerning a girl, aged 10, having a history of abdominal trouble since childhood. For the past few years she has been seized with abdominal pain, usually beginning at week ends, especially after romping about. During the attack the patient pales, draws up her knees, and complains of pain about the umbilicus. There is no rise of temperature and no abdominal rigidity and tenderness on pressure about the umbilicus. Occasionally the attack is accompanied by emesis of colorless mucus. The heart, lungs and reflexes are normal.

M.D., Ohio.

**ANSWER.**—Recurrent attacks of abdominal pain over a period of years may necessitate a rather complete study in order to arrive at a satisfactory diagnosis. The possibilities as to the cause are many. Abdominal pain and vomiting are symptoms frequently seen in many disturbances in childhood and of themselves are not sufficient to arrive at any definite conclusion. The child's habits of eating, play and routine should be investigated, especially as the attacks tend to recur during the week ends. Fatigue, excitement and dietary changes at these times may be a big factor.

The possibility of abnormalities of the intestinal tract must be considered, although the prolonged period and frequency of the attacks rather argue against such conditions as chronic appendicitis, volvulus, mesenteric bands or congenital malformations. Functional conditions, such as slow gastric emptying time, may well be seriously considered. The possibility of an allergic reaction because of the periodicity of the attacks should be investigated. The presence of a history of eczema, asthma or hay fever would strengthen such an idea. Different contacts during the week end might be investigated.

#### DIAGNOSIS OF GONORRHEA

*To the Editor:*—A widow with no past history of gonorrhea infection, with one child, is engaged to a young man, and they had intercourse. Seven days later the young man developed a typical gonorrheal infection. He states that there was absolutely no other chance of infection, he not having had intercourse for the six months previous to this. On examination of the patient, the woman in question, the cervix appears entirely normal; there are no palpable masses, and the uterus is freely movable. I have made fifteen or twenty slides and have been unable to find any intracellular diplococci. There are a few gram-positive diplococci, which are not intracellular. I have told her that I am unable to make a positive diagnosis of gonorrheal infection in her case. They are still anxious to be married, and the information asked for is what assurance can be given the patient that she is not infected or that she might not subsequently reinfect her partner. I have instructed them that the danger of her being infected by him would be great, and that they were not to have intercourse for at least one year after he was pronounced cured, except when using condoms. Kindly omit name.

M.D. California.

**ANSWER.**—Assuming that the history is correct, the widow unquestionably has gonorrhea despite the negative results of examination, and no assurance can be given that there will be no future transference of infection.

Often it is possible to find the gonococcus in seemingly normal cases by carefully removing the cervical plug, squeezing the cervix with a pair of forceps and securing material from the cervical mucosa on a small swab that is rubbed into it. Skene's glands often do not emit macroscopic pus, though the gonococcus is present. They should be digitally stripped against the pubic bone and the secretion obtained by rubbing a small swab into the urethral floor just inside the urethral meatus.

Bartholin's glands should be kneaded digitally and any fluid forced out obtained on a swab or wire loop.

It is in such cases that the complement fixation test finds a special field of usefulness.

## REMOVAL OF CLOTTED BLOOD FROM THE BLADDER

*To the Editor:*—In a case of bladder carcinoma in which active bleeding, controlled one week before by suprapubic approach, occurred, what chemical means are there for dissolving or disintegrating obstructive blood clots in the bladder in order to facilitate vesical irrigations through a urethral catheter? The patient is a white man, aged 42, with a moderately severe anemia secondary to an infiltrating, inoperable malignant growth of the epithelial type. The tumor has been under observation for the past three years, during which time it has been subjected to high voltage roentgen therapy. Recently it presented a small area of ulceration, preoperative deep irradiation and cystoscopic fulguration of which were ineffectual in checking the hemorrhagic oozing. Saline irrigations at present return without evidence of fresh bleeding. The bladder is markedly contracted. Please omit name and address.

M.D., New York.

**ANSWER:**—Various chemical means have been tried for the purpose of dissolving and disintegrating massive blood clots in the bladder, but not with much success. Papain, which is a digestive ferment, has been used most frequently for this purpose. It is sold under different trade names, such as caroid.

It is usually necessary to remove clotted blood from the bladder by mechanical means. This is best done by the introduction of a tube of large caliber with a wide open end, to which a large syringe with powerful suction should be attached. The removal of obstructing blood clots in itself usually will tend to prevent further bleeding, unless there is an active bleeding vessel. A blood vessel of this type can best be controlled by electrocoagulation applied directly to the bleeding point. In malignant conditions it can sometimes be controlled by inserting multiple seeds containing radon into the submucosa of the area affected. Diffuse mucosal oozing may be more difficult to stop. The application of an aqueous solution of alum is sometimes of value. Continuous and intermittent lavage of the bladder after the clots have been removed is of the greatest importance to prevent further formation of clots.

## AIR FILTERS AND HAY FEVER

*To the Editor:*—I am installing in my home a central heating and air conditioning system, which I hope will relieve hay fever suffered by my daughter, aged 9, during the summer months. I should like to know the material or type of filters best suited to the removal of pollen in such an installation. Please omit name.

M.D., Connecticut.

**ANSWER:**—Air filters used for pollen filtration should have a large surface area obtained by fluting the filter surface. This permits the current of air to be delivered at a slow velocity. The surface area required depends on the cubic content of the space to be air conditioned. It is best to recirculate the air through the filter, taking in only a small amount of outdoor air in order to avoid bringing in a large amount of pollen from outdoors.

Material made of cellulose, used in from six to twelve layers, has been found to be an excellent filtering medium. This should be in a frame that is air tight and will permit the easy change of filters. This is required about once a week.

An engineer who is experienced in the problems presented by air conditioning should supervise all plans for the installation of the system. A great advantage for the sake of comfort is air cooling in addition to filtration.

## ABSCESS OF LOWER END OF TIBIA

*To the Editor:*—A woman, aged 24, complains of severe pain in the region of the ankle. The tenderness is localized over the lower end of the tibia, and she has a temperature of 101 F. The past history reveals that fifteen years ago she had what was interpreted as tuberculosis of the bone (in the same area) and after wearing a cast for four months was completely relieved. A roentgenogram taken recently shows a triangular area of necrosis in the lower end of the tibia with its base facing the ankle joint. She has now been wearing a cast for a period of three weeks but there has been no relief of pain and she continues to have a fever of 100.5 F. daily. There is no history of trauma and the physical examination is essentially negative otherwise. Can you suggest any further treatment. Kindly omit name.

M.D., New York.

**ANSWER:**—This is evidently a localized abscess in the lower end of the tibia, of the Brodie type, probably due to a *Staphylococcus albus* infection. It is possibly a recrudescence of the original trouble of many years ago.

In view of the elevation of the temperature and the local tenderness, an immediate operation should be performed.

An incision three-fourths inch long should be made, under local anesthesia with 1 per cent procaine hydrochloride, over the lower end of the tibia, in the neutral space between the tendons of the tibialis anterior and the tibialis posterior. The

cortex of the bone should be drilled with a one-eighth inch drill, and the necrotic cavity penetrated. If pus exudes, it should be sent to the laboratory for examination by smear and culture. The incision should be left open and a petrolatum gauze dressing applied. There will be a moderate drainage for a considerable time, and the wound will then gradually close.

It is usually not necessary to open the bone widely in cases of this kind; in fact, they heal much more quickly than if the bone is saucerized.

## TRAVELING EXPENSES DEDUCTIBLE

*To the Editor:*—Are expenses incurred by a physician in attending medical meetings deductible in the computation of his federal income tax? I have been informed by an income tax examiner that such expenses cannot be deducted.

M.D.

**ANSWER:**—Traveling expenses, including amounts paid for transportation, meals and lodging, incurred in attending medical meetings for a professional purpose are deductible for federal income tax purposes. The Board of Tax Appeals has so held in *Cecil M. Jack v. Commissioner of Internal Revenue*, 13 B. T. A. 726, and in the case of *J. Bentley Squier*, 13 B. T. A. 1223. The attention of the examiner should be directed to these decisions.

## NERVOUS EXAGGERATION OF GAG REFLEX

*To the Editor:*—I have a patient whose only significant symptom is an exaggerated gag reflex and an unusual consciousness of his soft palate. The patient is a healthy middle aged adult who has had this symptom for approximately eight weeks. Every morning during this time, except two, he has had gagging and retching after breakfast and occasionally has regurgitated a little food. During the rest of the day the reflex is much less active, but he is almost always conscious of a peculiar sensation in the soft palate. I have had his nose and throat examined under local anesthesia and they were pronounced normal. The patient is not neurotic in any ordinary sense of the word but of course is extremely annoyed by this abnormal sensation. I have tried sodium bromide, 60 grains (4 Gm.) a day, with slight relief, but the appearance of a bromide skin eruption forced discontinuance of this treatment. No one to whom I have referred the patient has seen a similar case, nor have I. Is there any possible cause for this or can you suggest any outline of treatment? Please omit name.

M.D., Michigan.

**ANSWER:**—The symptoms described are not characteristic of any known organic lesion in the nose, throat or esophagus. If examination of these organs has failed to reveal the presence of disease, it can be concluded with safety that the discomforts are entirely nervous in origin. An exaggeration of the gag reflex is not uncommon, and it is likely that the recent intensification of this symptom is based on psychic factors. Fear of organic disease, particularly tuberculosis and carcinoma, is a frequent cause of such distress. Assurance to the patient of the absence of any serious lesion is of more value in treatment than the employment of sedative drugs.

## FROZEN MILK

*To the Editor:*—THE JOURNAL, February 15, page 562, carried a query and answer under the heading "Use of Frozen Milk in Infant Feeding." May I point out that the observations on cow's milk that has frozen do not seem to apply to human milk that has been frozen for the purpose of preservation? The process of freezing human milk was described by Mr. Washington Platt and by me in the *Journal of Pediatrics* (2: 472 [April] 1933) and the *New England Journal of Medicine* (209: 893 [Nov. 2] 1933). At the Directory for Mothers' Milk in Boston we have been freezing human milk for three years, and up to the present time have distributed 25,259½ ounces with perfect satisfaction. The milk goes back into emulsion perfectly, the bacterial count is extraordinarily small, and the process is a very quick one and adequately bridges the gap between surplus and deficit. Frozen milk was the only form in which the air express would accept milk for transportation.

PAUL W. EMERSON, M.D., Boston.

## IRRADIATION OF OVARIES IN CANCER OF THE BREAST

*To the Editor:*—In THE JOURNAL, March 14, page 944, is a reply as to the advisability of irradiation of the ovaries in cases of cancer of the breast, in which the statement is made that "roentgen therapy to the ovaries has no place in cases of cancer of the breast." I believe this statement to be contrary to the accepted beliefs of the majority of workers in the fields of cancer and radiology. Not only is such treatment decidedly helpful in the cases of those women who have not passed through a natural menopause, but it is probable that, before long, pituitary irradiation will also be used in the treatment of cancer of the breast. The latest experimental work so far concluded would seem to indicate that irradiation of the pituitary would be a logical procedure.

HAROLD A. HILL, M.D., San Mateo, Calif.

## Book Notices

**The Anatomy of Personality.** By Howard W. Haggard, M.D., and Clements C. Fry, M.D. Cloth. Price, \$3. Pp. 357, with 10 illustrations. New York & London: Harper & Brothers, 1936.

Evidently the Greeks had a word for it, since Theophrastus some 2,300 years ago left us a discussion of various types of personality. The poets and the playwrights have been doing the same indirectly, and scientists and pseudoscientists have spoken from their lofty eminences concerning that elusive quality of the human being known as personality. Haggard and Fry have attempted a serious study of the personality of man based on an analysis of the more or less measurable qualities, of which they choose (1) the physique, (2) the impulse or driving force, (3) the intelligence, (4) the temperament and (5) the ego. The first three need no particular discussion in this review. The temperament is still further subdivided into tempo, mood and resonance (depth of feeling). As far as the ego is concerned, individuals with strong egos are divided into the egoists, who are impervious to external criticism, and the egocentrics, who are constantly on the defensive; and these two are contrasted with "those meek souls with weak ego who we are told with dubious logic 'will inherit the earth.' Certainly they will acquire it in no other manner." The book presents a number of clinical documents sympathetically considered and is remarkable for at least one omission, the "inferiority complex," which is spread over the pages of most books devoted to popularizing the study of the mind. Moreover, the words "Oedipus complex" occur only once. The authors acknowledge their debt to Eugen Kahn, whose teachings can be followed through the chapters on temperament and ego. The book is written in a straightforward and interesting manner and is not too advanced in its terminology and language to confuse the educated layman. There are a few statements that are ill advised, such as "The regrettable dictum of fashion is now to breed for leptosomes"; but these are Haggardisms and do not impair the value of the book. In writing the book the authors state: "It is our hope that our reader will obtain some insight into his own personality that gives the understanding of self which is the first step towards self improvement; and also some insight into the peculiarities of others which is the first step towards the broad tolerance that gives respect for fellow men."

**A Clinical Text-Book of Tropical Medicine.** By Dr. C. D. de Langen, Professor of Medicine in the Medical School of the University in Batavia, Java, and Dr. A. Lichtenstein. Done into English by Dr. A. H. Hamilton, B.A., M.D., L.M.B.D. First English edition from the revised third Dutch edition. Cloth. Pp. 557, with 51 illustrations. Batavia, Surabaya & Amsterdam: G. Kolff & Co., 1936.

According to the authors, clinical medicine in the tropics, as compared with that of the temperate zones, differs less in the particular diseases with which it deals than in their relative frequency, their different groupings, and the difference in the clinical courses which they run. The authors, however, fail to note that, in a few instances at least, the geographic distribution of certain intermediate hosts of pathogenic parasites of man restricts certain diseases, such as clonorchiasis and African trypanosomiasis, to the tropical or subtropical regions. However, even these restrictions are not zonal but rather geographic or even ecologic, and are correlated with a high degree of host specificity. The phrase "tropical disease" is therefore somewhat of a misnomer, but the results of the practice of medicine in the tropics tend increasingly to demonstrate the importance of the climatic factor in the incidence, clinical picture, treatment and prognosis of particular diseases. Therefore the authors state that it is their purpose to supplement existing textbooks of internal medicine along these distinctive lines.

Illustrations of these contrasts in disease in temperate and tropical conditions appear in the discussion of cancer. Whereas the same types of cancer occur in Holland and in Java, cancer of the stomach is responsible for half of the deaths due to cancer in Holland and is rarely seen in Java. On the other hand, primary carcinoma of liver cells is seldom seen in Europe but is relatively common in Java, where by the end of 1932 about 390 cases in Malays and Chinese had been recorded, none

of which had been included in Herscheimer's (1930) 600 cases in the world literature. Malignant growths also tend to be frequent on the sides of the neck and on the legs and feet. The authors emphasize the biologic significance of experimentally induced nematode (*Gongylonema*) sarcoma and of cestode (*Taenia*) sarcoma in rats but do not hint that there may be any connection between amebic hepatitis and hepatic cancer, both of which seem to be rather prevalent in Java.

A second illuminating comparison of temperate and tropical diseases appears in the discussion of psychoses. In general the authors incline to the view that the psychoses of Europeans in the tropics show no essential differences in kind from those seen in temperate regions. Even "amok" and "koro" (an anxiety neurosis involving a fear of a fatal shrinkage of the penis) can hardly be regarded as either racial or tropical in origin. It was quite the custom for native patients in the various hospital wards of the old hospital in Batavia to run amuck, but after removal to the new modernized quarters at Weltevreden these maniac outbreaks abruptly ceased.

The Dutch text of this book ran through three editions in ten years and has had the benefit of revision. The authors' experiences as professor of medicine in the University at Batavia, Java, and as lecturer in the military course in tropical medicine have afforded rare opportunities for practical contacts with the problems of disease in the tropics among white persons, Malays and Chinese under exceptional conditions as to modern facilities, incidence and opportunities for experimentation and control.

As might be expected in this treatise, malaria, yaws, typhus, dengue, leprosy, plague, the dysenteries, hookworm, beriberi and tropical liver loom into the foreground. The authors are less sanguine about the effectiveness and practicality of malarial prophylaxis by mosquito control than Americans having only a narrow strip of the Canal Zone controlled by a war department in which to demonstrate its value. They incline somewhat to quinine prophylaxis, are cautious about the toxic aspects of plasmochin, and are rather hopeful that atabrine may prove to be the prophylactic of the future.

In their discussion of amebiasis they regard amebic hepatitis as one of the causes of "tropical liver" and as originating from chronic amebiasis. They ill advisedly use the name *tetragena* instead of *histolytica* and make no mention of carbarsone and vioform for the treatment of amebiasis.

The book is a rich mine of information derived from long practical experience in which most often major well known diseases of temperate regions appear in a more or less new light. It seems probable that its perusal might illuminate "temperate" medicine. It is a vivid demonstration of microbial and parasitic origins of disease and at the same time a powerful argument for the interacting factorial bases for the disturbances of the norm in man by such patent factors in vital processes as temperature. It is well conceived, well organized and well written, but the illustrations are as a whole inferior in plan and execution.

**Veterinary Military History of the United States: With a Brief Record of the Development of Veterinary Education, Practice, Organization and Legislation.** By Louis A. Merrill, Lt. Col., Vet.-Res., Chief Veterinarian, First Army, American Expeditionary Forces, and Delwin M. Campbell, Lt. Col., Vet.-Res. Sponsored by the American Veterinary Medical Association. In two volumes. Cloth. Price, \$10, per set. Pp. 620; 621-1,172, with illustrations. Chicago: Veterinary Magazine Corporation, 1935.

The authors undertook for the first time to write an American veterinary history, a task which was difficult because of the scarcity of authentic records. Veterinarians have participated in all the wars in which the United States has engaged, but none of them until the present moment left a lasting record of their experiences. This fact shows, the authors say, how undeveloped, disorderly and indifferent the veterinary profession of North America has been. The genesis of veterinary medicine in the United States falls into three epochs, sharply divided by great wars: (1) the Revolutionary War, which led to the development of a tremendous livestock industry and established the field for the present veterinary profession; (2) the Civil War period, during which an organization was established to plan disease control among the animals, and schools were founded to furnish the personnel; (3) the World War,

which for the first time exposed the weakness of the veterinary educational system and established a new era in American veterinary history. The Surgeon General of the army during this period took action to correct the veterinary educational system and private veterinary institutions succumbed one after another, leaving all veterinary instruction to publicly supported institutions. Although enormous losses had been sustained previously from animal plagues, it was not until 1884 that the Bureau of Animal Industry was founded and not until after the great war in 1917 that a veterinary service such as other nations had for more than a century was established in our own army. The authors pay tribute to the extremely valuable research that has been done by the Bureau of Animal Industry but do not undertake to include here those features of veterinary history. There are a few introductory pages on ancient veterinary history; indeed, they state that the birth of the veterinary art preceded that of human medicine, wavering, however, on whom to call the father of veterinary medicine. Many give this honorable title to Vegetius, who lived about 500 A. D. He was the first author of the Christian era to write a work devoted entirely to veterinary medicine, and his doctrines have become consecrated precepts in the veterinary profession. Among the illustrious characters of ancient veterinary history is one named Hippocrates, who should not be confused with Hippocrates the great physician, who lived eight centuries earlier. The authors add here a bibliography of fourteen references for readers especially interested in ancient history.

Much of these volumes is taken up with accounts of the veterinary service during the various wars of the United States. The general tone of the story, as told, does not reflect much credit for the way this country provided for its animals during these emergencies: it accentuates the fact that the United States has always been unprepared with regard to animals to be used to help carry on its wars. Some of these pages do not reflect credit on the veterinary profession itself. During the World War, the veterinarians became a part of the medical department of the army and were privileged to become commissioned officers, a status which they never before enjoyed in the armies of the United States.

This history is the outgrowth of a series of articles published in 1932, which included only the experiences of the senior author in the World War; later he decided to expand the manuscript to include the entire history of the military-veterinary services in the United States from the Revolution to the present time. At the close of the second volume they include a list of veterinary officers of the World War, those in the Veterinary Corps of the regular army in 1935, and a list of all veterinarians who have served in our armies since 1879. There are many interesting and instructive facts about veterinary history stated here and numerous interesting pictures, some not so closely related to the adjacent text. Probably as succeeding editions of the history appear, some improvements in the layout and some deletions and additions will be made.

*Vom Sinn der Sinne: Ein Beitrag zur Grundlegung der Psychologie.* Von Erwin Straus. Paper. Price, 12 marks. Pp. 314. Berlin: Julius Springer, 1935.

The reader who attempts to evaluate this book will find it necessary to examine it with reference to the "cultural science" movement in contemporary German psychology. For in line with that movement, a rationale which places great emphasis on epistemological issues is developed for "understanding" as opposed to "explanation" as the end of psychologic analysis. To gain the dignity of antiquity, the author meticulously traces the various steps by which modern psychology has in his opinion been derived from the seventeenth century teachings of Descartes. Of the several branches of the "cultural science" movement, Straus is probably most clearly identified with the existential school. The point of view of this school has been characterized on the positive side by a body of quasiphenomenological concepts and on the negative side by a lack of any distinctive methodology. The author attempts to minimize the lack of method by showing that pavlovian "conditioning" is but a special instance of cartesian philosophy, whose most faithful modern expression is the existential school. To document this position he quotes a passage from *Passions de l'âme* which

leaves little doubt that the general phenomenon of "conditioning" was recognized by Descartes. The scope of the book is broad, but its appeal is based chiefly on the theoretical treatment made of known facts rather than on the presentation of new ones.

*The Practitioners Library of Medicine and Surgery. Volume IX: Neurology and Psychiatry.* Supervising Editor: George Blumer, M.A., M.D., David P. Smith, Clinical Professor of Medicine, Yale University School of Medicine. Associate Editors: James C. Fox Jr., B.A., M.D., Associate Clinical Professor of Neurology, Yale University School of Medicine, and Clements C. Fry, B.S., M.D., Associate Professor of Psychiatry and Mental Hygiene, Yale University School of Medicine. Cloth. Price, \$10. Pp. 1,234, with illustrations. New York & London: D. Appleton-Century Company, Inc., 1936.

This volume in a series that has already become monumental is concerned with neurology and psychiatry. An attempt has been made to present the data on an etiologic basis. Most textbooks on neurology and psychiatry approach the subject from the anatomic point of view. Recent advances in biochemistry and particularly in psychology make textbooks in this field obsolete almost as soon as they are published. The editors have selected for this work many of the great names in modern American neurology and psychiatry and provide as well some contributions by authors from abroad. The book opens with two excellent chapters on psychopathology by Myerson, then discusses psychology, and presents special methods of examination and psychoanalysis. These matters occupy the first 150 pages. The rest of the book, to the extent of a total of 1,200 pages, is largely concerned with more material methods, such as the technic of cerebrospinal fluid examination, ventriculography, the diagnosis of infections involving the brain, the injury due to syphilis, the results of intoxications with poisons, the results of infectious diseases and trauma, electrical injuries and birth injuries. Then come the articles on visual changes, malformations and degenerations, the paroxysmal disorders, and finally some large chapters on psychoses. To each of the chapters there is appended a bibliography of current references. The volume is handsomely printed, like the previously published volumes, and there are numerous well chosen, instructive illustrations. If there is any particular lack in the work it lies in the inability of the author, because of the limitations of space, to do much in the way of presentation of cases which are typical and which no doubt constitute the most instructive available material. The size and scope of this volume must necessarily impress the reader with the vast accumulation of material in this field during the present generation.

*A Doctor's Odyssey: A Sentimental Record of Le Roy Crummer: Physician, Author, Bibliophile, Artist in Living, 1872-1934.* By A. Gaylord Beaman. With a word in memory by A. Edward Newton and numerous memoirs and appreciations. Cloth. Price, \$2.50. Pp. 340, with 21 illustrations. Baltimore: Johns Hopkins Press, 1935.

Had Le Roy Crummer not begun to collect old medical books in 1917 he would be remembered chiefly as a prominent practitioner of medicine, some would say the leading internist in Omaha. This prominence was not accidental; he was well qualified to succeed. He was the son of an able, cultured physician, had had a good education in this country and in Europe, was industrious, showed interest in his patients as human beings and not alone as cases, and had an attractive personality and the bearing of a gentleman. He was popular as a teacher. At society meetings or at consultations he was helpful because of his store of knowledge, his skill in diagnosis, his sound advice. With colleagues as with patients he made friendships through his camaraderie. Even his frank and sometimes caustic comments, or his sarcastic and epigrammatic criticisms, were robbed of much of the sting by his sense of humor and his evident friendliness. But in 1917 he began to collect books. Soon he was an international figure. He was fortunate in having the means with which to buy rare or expensive volumes, fortunate in having the sage advice and enthusiastic encouragement of a wife who was herself a collector in the field of English literature. He was fortunate also in having a keen sense of values, in being a shrewd purchaser who was fascinated by the game. To him a book was worth owning not simply because it was old. There must be other reasons—paper, typography, binding, illustrations, state of preservation. The

author or the book must mean something in the history of medical development. So he gathered together a library which became famous and at his death enriched several other libraries, notably that of the University of Michigan. As a collector he was especially known for his assembling of fugitive anatomic sheets and for his discovery and publication of a hitherto overlooked Heberden manuscript, as well as for his collection of Harvey and Jenner items. In his later years this avocation became his major pursuit; it was his joy. The frequent trips, carefully planned and joyously anticipated, brought Dr. and Mrs. Crummer into intimate contact with book dealers and bibliophiles in this country and in Europe. Many cherished friendships resulted from the wanderings of this much traveled medical Odysseus. All the wanderings are shown in this volume. It is replete with facts and personal incidents concerning Dr. Crummer from his early life to the last sad years of suffering in California. There are many tributes and many excerpts from letters. All this will be read with interest by the friends who mourned his loss at the age of 62 when joy in his books seemed to be at its peak and his usefulness to medical history had not yet reached its full fruition. The book is a fine memorial to a superior physician, a renowned collector and an attractive personality. Greater unity and effectiveness would have resulted were there less repetition and fewer contributors, or had Dr. Beaman assumed more the function of editor than compiler.

**Précis de physique médicale.** Par André Strohl, professeur de physique médicale à la Faculté de médecine de Paris. Cloth. Price, 70 francs. Pp. 723, with 320 illustrations. Paris: Masson & Cie, 1935.

This book covers a wide range of physical factors and aspects in normal physiologic processes, disease, diagnosis and therapy. Animal calorimetry and the physical chemistry of solutions are presented too simply in view of present knowledge and methods. The gross mechanics of muscle action, locomotion, respiration, blood pressure and circulation are presented satisfactorily for the medical student. Acoustics, optics and electrophysiology are presented in more than usual detail. Biologic reactions to light radiations are considered briefly and generally, but the biologic action and therapeutic application of ultraviolet radiations, x-rays and radon are given in considerable detail. The book may be considered a good elementary presentation of physics as applied to medicine rather than a fundamental textbook on biophysics or general physiology.

**For and Against Doctors: An Anthology.** Compiled by Robert Hutchinson and G. M. Wauchope. Cloth. Price, \$2. Pp. 168. Baltimore: William Wood & Company, 1935.

Since the earliest times, writers have not hesitated to express their personal opinions of the medical profession. In these writings, doctors have been pitilessly abused and extravagantly praised. The British authors have apparently collected from many sources proverbs and writings about doctors, and they are here offered in a handsome little book nicely printed for those who wish to have easily available these classical quotations. It is not of course strange to observe that the same ideas have been reported from century to century in different words. For example: "A physician who professes to cure for nothing is often worth nothing," "The most tragic thing in the world is a sick doctor," and "Doctors, when the cause of a disease is discovered, think that the cure is discovered." The last quotation is from Cicero around 60 B. C. and is just as true now as it was then.

**Introduction to the Microtechnique of Inorganic Qualitative Analysis.** By A. A. Benedetti-Pichler, Dr. Tech. Sc., Assistant Professor of Chemistry, Washington Square College, New York University, and W. F. Spikes, M.S., Washington Square College, New York University. Cloth. Price, \$3. Pp. 180, with 76 illustrations. Douglaston, N. Y.: Microchemical Service, 1935.

This book should be of great use to workers in toxicologic and other biologic laboratories where small quantities of materials must be analyzed. The fundamental principles and the underlying methods are intelligently presented and a good many analytic procedures are described. The book is profusely illustrated with mechanical drawings, which greatly enhance its worth. It should lead to valuable applications of the micro-analytic methods to biologic problems.

**Experimentelle undersøgelser over bartonellaanæmi hos rotter og mus.** Af Gunnar Alsted. With an English summary. [Experimental Investigations into Bartonella Anæmia in Rats and Mice.] Paper. Pp. 144, with 19 illustrations. Copenhagen: Levin & Munksgaard, 1935.

In this dissertation the author presents the results of his experiments on Bartonella infection or anemia in white rats and other animals. Bartonella organisms are minute rod-shaped, intra-erythrocytic bodies, the precise nature of which has not been established definitely. In rats latent infection is exceedingly common and when the spleen is removed a severe anemia of the macrocytic type may develop. The rôle of the spleen in preventing Bartonella anemia in rats is perhaps its best established function. Alsted made experimental studies on various aspects of Bartonella infection of rats and other animals. His experiments on treatment of Bartonella anemia in animals with preparations of liver did not yield any encouraging results. The main details of the results are recapitulated at the end of the thesis in an English summary. It may be of interest to recall that the Peruvian student Carrion died in 1886 from Oroya fever (Carrion's disease) two weeks after he had inoculated himself with material from a nodule of verruca peruviana, and that some years later Barton discovered a form of the organism named after him in Oroya fever.

**You Must Eat Meat: Fancies, Follies and Facts About Meat.** By Max Ernest Jutte, M.D. Cloth. Price, \$2. Pp. 164. New York: G. P. Putnam's Sons, 1936.

The author believes that most chronic diseases, such as colitis, asthma, gout and stomach disorders, are due largely to excessive fermentation of starches and sugars and that meat counteracts and stops excessive fermentation. He therefore presents a good deal of material in favor of this point of view, which, incidentally, has no more acceptance than the points of view of the vegetarians, which he attacks. One of the chapters is devoted to the so-called Salisbury meat diet. The volume is peculiarly printed with a thin column on a wide sheet, causing one to feel that it is perhaps the result of a pick-up from some periodical. While the book contains much common sense, it is obviously written by a prejudiced observer who is ready to accept any evidence that supports his point of view.

**Opuscula selecta Neerlandicorum de arte medica.** Fasciculus tertius-declmus quem curatores miscellaneorum quae vocantur Nederlandsch Tijdschrift voor Geneeskunde collegerunt et ediderunt Amstelodami Sumptibus Societatis. Consultationes medicae. [Selected Dutch Writings on Medical Art, No. 13. Medical Consultations.] Cloth. Pp. 307, with illustrations. Amsterdam, 1935.

This volume in the notable series of historical publications sponsored by the *Nederlandsch Tijdschrift voor Geneeskunde* contains selected letters from the correspondence of fourteen Netherlandish physicians and scientists. The dates of the letters run from June 20, 1550, to Jan. 20, 1870. Among those represented may be mentioned Vesalius, Guy Patin, Descartes, Boerhaave and Camper. As a rule the letters in Latin are accompanied by Dutch translations. Of lively interest are the nineteen portraits of writers. M. A. van Andel writes an instructive introduction in Dutch with a French translation. There are brief biographic notes, mostly in English. The volume is a valuable addition to the literature of medical history.

**The Hair and Scalp: A Clinical Study (With a Chapter on Hirsuties).** By Agnes Savill, M.A., M.D., M.R.C.P.L., Consulting Physician to Fitzroy Square Skin Hospital, London. Cloth. Price, \$5. Pp. 288, with 55 illustrations. Baltimore: William Wood & Company, 1935.

The frontispiece of this excellent study is a reproduction of a page of a book published in 1550 telling of an interesting condition known as "alopecia." Dr. Savill discusses the structure and physiology of the hair, the occurrence of gray hair, cutting and singeing, brushing and combing, elastic properties and common disorders. She then takes up the various forms of baldness, infection and parasitism, and concludes with a chapter on hirsuties. The book provides several pages of useful prescriptions. The volume is a standard one and will be found a most useful reference book by all physicians especially concerned with the subject. Among the most recent topics discussed is the use of pituitary in alopecia and in psoriasis. Here the author merely mentions the method as being worthy of trial without any conclusion as to its merit.

**Nahrungsmitteltabelle zur Aufstellung und Berechnung von Diätverordnungen für Krankenhaus, Sanatorium und Praxis.** Von Dr. Hermann Schall, leitender Arzt des Kindersanatoriums und des Erholungsheims Westend für Erwachsene, Königsfeld (Badischer Schwarzwald). Eleventh edition. Boards. Price, 5.40 marks. Pp. 127. Leipzig: Curt Kabitzsch, 1935.

This is a reprint of a standard German textbook which makes available data regarding percentage composition of foods from the point of view of protein, carbohydrate, fat, minerals, salts and vitamins. Such tables are invaluable to the scientific dietitian.

**Diet and Die.** By Carl Malmberg. Cloth. Price, \$1.50. Pp. 149. New York: Hillman-Carl, Inc., 1935.

In this small book the author tells much about current fallacies promoted by such writers as William Howard Hay, Benjamin Hauser and the other peculiar dietitians who have recently invaded the field of diet. He discusses as well the current reducing diets, such as the banana and skim milk diet, the Hollywood diet and the milk farms. The book is nicely written and quite authoritative. The title would seem to have been unfortunately chosen, since it is far more sensational than the content. The book may well be recommended by all physicians to patients who are interested in being disillusioned relative to the fallacies that recur again and again in the field of nutrition.

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Medical Practice Acts: Faith Healing Exempted from New Jersey Act.**—The defendant, Bascom W. Maxwell, was convicted of violating the medical practice act of New Jersey and sought a reversal of the conviction in the supreme court of that state.

According to the evidence, Maxwell sold a book entitled "Eternal Wisdom and Health." He maintained a store in Atlantic City with seats arranged in rows, and spoke of the infinite spiritual forces which illuminate the body with the principles of truth, love and light. He preached the triumph of the mind over the ills of the body and the power of the will to drive out disease. He used neither drugs nor material remedies. He told his patients to sit erect, feet firmly on the floor and will themselves to feel the forces of which he talked. Obviously, said the supreme court of New Jersey, that which the defendant did constituted no violation of the medical practice act, section 127-36 of which provides that the provisions of the act shall not apply "to the ministrations to, or treatment of, the sick or suffering by prayer or spiritual means, whether gratuitously or for compensation, and without the use of any drug or material remedy." The philosophy which the defendant sought to teach, the court said, was the power of the mind over the ills of the body. He told those who came to him how to sit and think, and gave them assurances of the cure of every ailment by such means. Such advice, in the opinion of the court, clearly came within the exception noted above. The conviction was therefore set aside.—*State Board of Medical Examiners v. Maxwell (N. J.), 181 A. 694.*

**Workmen's Compensation Acts: Hernial Sac Not a "Hernia."**—The workman, in the course of his employment, was pulling planks from a pile of lumber. He slipped, twisted his body, and immediately suffered severe stabbing pains in and about the middle of his abdomen, which recurred from time to time. About eight days later he discovered a small protrusion on his abdominal wall and reported that fact to his employer. A physician, supplied by the employer, diagnosed the condition as epigastric hernia and an operation was performed. The hernial sac was found to be bound to the surrounding tissue by fibrous adhesions, which cut almost like cartilage. The sac was densely adherent to these tissues, indicating to the physician that the sac had existed for some time.

The Idaho workmen's compensation act, section 43-1116, requires, as one of the prerequisites to an award of compensa-

tion in all cases of hernia, "3. That the hernia did not exist in any degree prior to the injury by accident for which compensation is claimed." In the present case, the industrial accident board denied compensation, on the ground that the worker's hernia existed to some degree prior to the injury by accident, even though it found that the hernial sac contained none of the abdominal contents prior to the accident. The district court, Shoshone County, reversed the order of the commission denying compensation, and the employer and his insurance company appealed to the Supreme Court of Idaho.

The only question presented, said the Supreme Court of Idaho, is whether or not the worker had the hernia to some degree prior to the time he sustained his injury. The record discloses that prior to the accident the worker was strong and healthy and had been engaged for a long period of time in hard manual work. He had never noticed or suffered pain or inconvenience of any character because of the existence of the small sac. Referring to a similar question in *Stoddard v. Mason's Blue Link Stores, Inc. (Idaho), 45 P. (2d) 597*, it was said:

In all the definitions of "hernia" that have been called to the attention of the court or which have been found "hernia" is described as being the protrusion of some organ or some tissue from its normal situation through an accidental or natural opening in the walls of the cavity within which it is contained. In no instance does it appear that the perforation or aperture, either natural or accidental, and without protrusion of some organ or tissue, is defined as a "hernia."

The word "organ" or "tissue" as used in the foregoing definition, said the court in the present case, does not include a hernial sac but rather has reference to some organ or tissue which protrudes through the hernial opening into the hernial sac. It follows therefore as a matter of law that the worker did not have a hernia in any degree prior to the accident. The Supreme Court accordingly entered an award of compensation in favor of the worker.—*Newman v. Rogers Lumber Co. (Idaho), 52 P. (2d) 136.*

**Osteopathy: Revocation of License for Deceitful Advertising.**—A license to practice osteopathy in California may be revoked for unprofessional conduct, defined to include:

All advertising of medical business which is intended or has a tendency to deceive the public or impose upon credulous or ignorant persons, and so be harmful or injurious to public morals or safety.

The board of osteopathic examiners revoked Gustason's license for a violation of the foregoing provision, finding, according to the record, that he had in separate listings in the telephone directory of the city of Los Angeles advertised and held himself out to the public as a specialist in the following services, illnesses, and diseases:

Accident, illness, health service, blood diseases, cancer, eye, ear, genitourinary, goiter, hemorrhoid, hernia, lung, men's diseases, nervous diseases, nose, plastic surgery, general surgery, skin diseases, syphilis, throat, tonsil, women's diseases, x-ray and clinical services, blood pressure, bone, chest, and children's diseases, epilepsy, gland, heart, kidney diseases, and practically everything else known to the science of medicine and surgery.

From the order of revocation, Gustason appealed to the superior court, Los Angeles county, which entered judgment denying a petition for a review. Gustason then appealed to the district court of appeal, second district, division 1, California.

In affirming the judgment of the superior court, upholding the revocation order of the board of osteopathic examiners, the district court adopted the following opinion of the trial judge:

"No postgraduate work was ever done by the petitioner, nor has he taken any special training in any hospital or medical college as to any of the branches of medicine and surgery in which he styled himself as a specialist. Under examination by members of the board he was unable to name a standard work on some of the various branches of medicine in which he represented himself to be an expert and it further appears that at the date of the hearing he had only performed two operations over a period of five years.

"The claims of the petitioner as reflected in his listings in the 'Buyers' Guide' were manifestly extravagant and false and inserted for the purpose of attracting to his office credulous and ignorant people who knew nothing of petitioner's professional background and experience. His advertisements in the 'Buyers' Guide' indicated that he was equally ready to treat as

a specialist such unrelated diseases as syphilis and cancer—tuberculosis and women's diseases—hemorrhoids and nerves—ear, eye, nose and throat and epilepsy—stomach diseases and skin diseases; and his surgical talents (as a specialist) were advertised to cover so wide a field as goiter, facial plastic surgery, bone surgery, ocular plastic surgery, and others. And in addition to all of the foregoing, he claimed to be an x-ray specialist.

"Eminent doctors, both of the allopathic and homeopathic schools, testified before the board that no doctor in the ordinary span of life could specialize in the many diseases of the human body and mind enumerated in petitioner's listings. . . . Is the medical profession helpless to protect its good name and the public interest against the palpably false claims of such a charlatan? Is it not against the public safety to permit a man utterly without specialized training, postgraduate work, or research experience to hold himself out as a specialist in bone surgery, when upon his own admission he has not performed more than two operations in five years? And is it not dangerous to the public welfare for such a man to treat as a specialist such a dread disease as syphilis, when he shows himself so ignorant (as the record indicates) as not to know the name of the manufacturer of the specific medicine commonly employed in its arrest and cure? Unless we are prepared to concede that the state has no interest to protect the health and lives of its citizenry and is ready to surrender its power of supervision over the practice of the learned professions we must conclude that upon the record as made, it was not only within the power of the Board of Osteopathic Examiners to discipline the petitioner but that it would have been derelict in its duty if it had failed to take official cognizance of his unprofessional conduct."—*Gustason v. Board of Osteopathic Examiners (Calif.)*, 51 P. (2d) 1106.

**Malpractice: Delay in Making Roentgenologic Examination of Leg Injury.**—The plaintiff, a boy aged 16 years, fell on the floor of his father's store as a result, he said, "of his knee giving way." He went to bed and two days later consulted the defendant, a physician. The knee was then swollen and inflamed. The defendant, as a part of his examination, measured the length of the boy's legs, and found them of equal length. After being informed that another physician had treated the boy for rheumatism for about a year, he made a diagnosis of arthritis of the knee, ordered his patient to bed, and prescribed a course of treatment for arthritis. Ultimately, the swelling and inflammation of the knee yielded to treatment. After about six or eight weeks of treatment, the defendant discovered that there was not full movement of the hip and ordered roentgenograms taken. According to a witness for the patient, in a suit for malpractice that ensued, these roentgenograms disclosed a fracture of the femur. The defendant and four other physicians, however, interpreted the roentgenograms as disclosing a separation of the epiphysis of the femur. The trial court directed a verdict for the physician, and the patient appealed to the Supreme Court of Pennsylvania.

The patient argued that a shortening of one of his legs was the result of the fall, and, although he complained of pain in his hip, the defendant did not take a roentgenogram until eight weeks after the fall. This delay, he contended, constituted negligence and resulted in his permanent injury. Medical testimony on behalf of the defendant was to the effect that the slipping of the epiphysis was due to infection, not trauma, and that the defendant's diagnosis of arthritis was a correct one; that there was nothing to put him on notice at first that there was anything wrong with the hip, since the measurements made at the time of the examination showed no disparity in the length of the legs, and that the pain complained of in the hip could have resulted from the condition of the knee; that a slipping of the epiphysis is very difficult to detect and diagnose, and that, under all the circumstances in the case, what the defendant did was proper. It does not constitute negligence or unskilful treatment, said the Supreme Court of Pennsylvania, if a physician does not immediately employ roentgenograms as an aid in diagnosing a patient's condition. Whether this or another method of inquiry shall be resorted to is a matter of judgment, and a failure to use the one or the other cannot be

said to be negligence. At most, all that can be said is that the defendant in the present case made a mistake in diagnosis where the symptoms were obscure. For this there is no liability. Where competent medical authority is divided, a physician will not be held responsible if, in the exercise of his judgment, he follows a course of treatment advocated by a considerable number of physicians in good standing in his community.

The judgment in favor of the physician was accordingly affirmed.—*Duckworth v. Bennett (Pa.)*, 181 A. 558.

**Accident Insurance: Epilepsy Due to Trauma Antedating Issuance of Policy.**—A policy issued by the defendant insurance company, Feb. 18, 1928, provided certain benefits on "proof . . . that the insured has, while said policy . . . [is] in full force . . . become totally and permanently disabled, as the result of bodily injury or disease occurring and originating after the issuance of said policy." The insured brought suit on the policy alleging that he had become totally and permanently disabled because of epileptic convulsions. The trial court directed a verdict for the insurance company and the insured appealed to the Supreme Court of South Carolina.

In 1914, the insured was struck on the head by a timber and sustained a depressed fracture of the frontal bone. In August 1928 he began to have epileptic convulsions and was operated on to relieve his condition, but he continued to have convulsions, averaging as many as three a week. At the trial the physician who had attended him since 1928 testified that he diagnosed the insured's condition as traumatic epilepsy, caused by an injury to the brain, and that in his opinion the convulsions were directly attributable to the injury sustained in 1914. Another physician, called by the insurance company, testified to the same effect and further stated that epileptic convulsions may occur any time from the date of an injury for a period of twenty years. From a consideration of the medical testimony, said the Supreme Court, the conclusion is inescapable that the epilepsy resulted from the injury to the head sustained by the insured in 1914, many years prior to the issuance of the policy, and was not, therefore, within the coverage of the policy. The Supreme Court accordingly affirmed the judgment in favor of the insurance company.—*Nalley v. Metropolitan Life Ins. Co. (S. C.)*, 182 S. E. 301.

### COMING MEETINGS

- American Association for the Study of Goiter, Chicago, June 8-10. Dr. W. Blair Mosser, 133 Biddle St., Kane, Pa., Corresponding Secretary.
- American Association for the Study of Neoplastic Diseases, Baltimore, June 11-13. Dr. Eugene R. Whitmore, 2139 Wyoming Ave. N.W., Washington, D. C., Secretary.
- American Dermatological Association, Swampscott, Mass., June 4-6. Dr. Fred D. Weidman, Medical Laboratories, University of Pennsylvania, Philadelphia, Secretary.
- American Neurological Association, Atlantic City, N. J., June 1-3. Dr. Henry A. Riley, 117 East 72d St., New York, Secretary.
- American Ophthalmological Society, Hot Springs, Va., June 1-3. Dr. J. Milton Griscom, 255 South 17th St., Philadelphia, Secretary.
- American Pediatric Society, Bolton Landing, N. Y., June 11-13. Dr. Hugh McCulloch, 325 North Euclid Ave., St. Louis, Secretary.
- American Physiotherapy Association, Los Angeles, June 28-July 2. Miss Jefferson I. Brown, Tichenor Hospital School, Long Beach, Calif., Secretary.
- Conference of State and Provincial Health Authorities of North America, Vancouver, B. C., June 22-24. Dr. A. J. Chesley, State Department of Health, St. Paul, Minn., Secretary.
- Maine Medical Association, Rangeley, June 21-23. Miss Rebekah Gardner, 22 Arsenal St., Portland, Secretary.
- Massachusetts Medical Society, Springfield, June 8-10. Dr. Alexander S. Begg, 8 The Fenway, Boston, Secretary.
- Medical Library Association, St. Paul, June 22-24. Miss Janet Doe, 2 E. 103d St., New York, Secretary.
- Montana Medical Association of Billings, July 8-9. Dr. E. G. Balsam, 208½ North Broadway, Billings, Secretary.
- New Jersey Medical Society of Atlantic City, June 2-4. Dr. J. B. Morrison, 66 Milford Ave., Newark, Secretary.
- North Pacific Pediatric Society, Victoria, B. C., June 24-25. Dr. M. L. Bridgeman, 1020 S. W. Taylor St., Portland, Ore., Secretary.
- Pacific Northwest Medical Association, Portland, Ore., July 8-11. Dr. C. W. Countryman, 407 Riverside Avenue, Spokane, Wash., Executive Secretary.
- Rhode Island Medical Society, Providence, June 3-4. Dr. J. W. Leech, 167 Angell St., Providence, Secretary.
- West Virginia State Medical Association, Fairmont, June 8-10. Mr. Joe W. Savage, Public Library Bldg., Charleston, Executive Secretary.

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to Fellows of the Association and to individual subscribers to THE JOURNAL in continental United States and Canada for a period of three days. Periodicals are available from 1926 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 12 cents if two periodicals are requested). Periodicals published by the American Medical Association are not available for lending but may be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

- Clinical Diagnosis of Tricuspid Stenosis: Report of Case Complicated by Paroxysmal Nodal Tachycardia and Auriculoventricular Dissociation. R. D. Friedlander and W. J. Kerr, San Francisco.—p. 357.

**Radiologic Study of Pulmonary Artery.**—Schwedel and Epstein emphasize the fact that it is possible to visualize roentgenologically not only the pulmonary artery but also its main branches. The shadow of the main trunk and left pulmonary artery can usually be seen in properly exposed films taken in the left oblique position or fluoroscopically. Obstruction anywhere in the pulmonary circulation (whether functional, as in congestive failure, or organic) will lead to dilatation of the pulmonary artery and its major and lesser branches. The size of the pulmonary artery and its lesser branches is of value in recognizing congenital lesions of the heart or pulmonary arterial system in the absence of clinical signs. Radioscopic examination can supply information not obtainable by other clinical means.

**Bacterial Endocarditis and Cardiac Irregularities.**—Segal points out that it is generally agreed that rhythmic disturbances are rare in the course of active bacterial endocarditis. With the increase in cases of bacterial endocarditis there have appeared more specific references to the occurrence of cardiac irregularities in the course of the disease. The literature is reviewed with reference to the cardiac irregularities in the course of bacterial endocarditis, rheumatic heart disease and rheumatic fever. A study of 192 cases of bacterial endocarditis, with electrocardiographic studies in sixty-seven, revealed four cases of auricular fibrillation, two of auricular flutter, nine of heart block, two of prolonged QRS interval, one of prolonged QT interval, one of left bundle-branch block, nine of gallop rhythm, fifteen of extrasystoles, twenty-one of left axis deviation and six of right axis deviation. Prolongation of the PR interval occurs more commonly in the cases of bacterial endocarditis with involvement of the aortic valves alone, or in combination, than in cases of mitral involvement. Disturbances in conduction time, particularly intraventricular block and bundle-branch block, are far less common in bacterial endocarditis than in rheumatic heart disease. The same is true of gallop rhythm and premature beats. A statistical study, including all other reported cases, leads one to conclude that auricular fibrillation and auricular flutter are rare in the course of bacterial endocarditis. The occurrence of auricular fibrillation and flutter in the course of bacterial endocarditis appears to be related to the functional integrity of the myocardium rather than to any grade of mitral stenosis in itself.

- New Stain for Connective Tissue, Mucin and Allied Substances. Elena de Galantha, Rochester, Minn.—p. 196.

**Bone Marrow Studies in Glandular Fever.**—Freeman reports two cases. One of the patients had glandular fever. The examination of her sternal bone marrow revealed the marrow spaces filled with typical immature lymphocytes found in the blood in this disease. The illness of the second patient began in a manner almost identical with that of the first and it remained the same for thirteen days. The sternal bone marrow observations were substantially the same as those in the first case. On the fourteenth day the patient suddenly developed new symptoms which made it necessary to change the diagnosis to acute lymphatic leukemia, which proved fatal. In view of these facts there is some basis for stating that the second patient was ill first with glandular fever and later with acute lymphatic leukemia.

**Idiopathic Flat Detachment of Macula.**—Walsh and Sloan cite three cases of a peculiar macular disorder which they observed during the past year and which represent a definite clinical entity. The essential subjective symptoms of the condition are unilateral dimness of vision with a positive scotoma, metamorphopsia and micropsia. Examination of the eyes with a hand ophthalmoscope shows an ill defined macular change suggesting an early choroiditis. Examination with the binocular ophthalmoscope, however, shows a definite swelling in the macular region of from 3 to 4 disk diameters in area, with a few small yellowish spots in the retina. Otherwise ophthalmoscopic examination is negative. There is an acquired transient hyperopia. Perimetric examination shows a central scotoma that may be absolute for small colored test objects. The disease tends to be self limited, and within a few weeks

the macular protrusion commences to flatten. The yellowish spots, however, are increased in number at this time. In from two to four months the macular protrusion and the acquired hyperopia disappear and the central scotoma disappears or is greatly reduced. The yellowish spots disappear. Micropsia and change in the light sense persist. There is a marked tendency to relapses, which are of lessened severity. The etiology is not definitely known. It has been suggested that it is due to a toxic process, probably septic in origin, that it might be secondary to disease of the accessory nasal sinuses, or that it might be due to a circulatory disturbance of the retinal vessels, either angioneurotic or allergic in origin. In the authors' patients although a few scattered foci of infection were discovered and treated, a definite cause was not established. They believe that the nature of the swelling at the posterior pole of the eye is due to a localized separation of the retina rather than to a localized edema of the retina and adjacent choroid. The following observations in their cases support this view: 1. The retinal vessels came forward sharply at the margin of the affected area and retained their superficial position over the entire elevated area. 2. Reduplication of the beam of the Friedenwald instrument was observed in two cases. This proved the presence of two reflecting surfaces separated by an optically clear space. The anterior surface, in their opinion, was retina and the posterior surface was pigment layer. 3. The temporary hyperopia decreased as the macular swelling diminished; consequently the perceptive elements must have been displaced forward. A tentative diagnosis of idiopathic flat detachment of the macula is readily made by consideration of the symptoms. The diagnosis can be made with finality by using a binocular ophthalmoscope and observing the progress of the case. Circumscribed detachment of the retina due to tumor, central choroiditis of the usual type, retrobulbar neuritis, actinic retinitis and syphilitic central recurrent retinitis as described by von Graefe and Weintraub must be excluded.

**Hereditary Macular Degeneration.**—Lloyd divides the fundus pictures of hereditary macular degeneration into three general types: those with a number of soft, white spots or dots throughout the periphery or about the macula, the severe cases with early pigment changes in the macula itself and poor vision and those that simulate partial coloboma of the choroid. These categories include amaurotic family idiocy. The fundus characteristics are very similar for cases in an individual family and this is true also of the age at which the changes appear. The milder form of macular degenerations of the first type exhibits a number of large, white or yellowish white spots about the macular area, the macula itself escaping until later in life. In young persons these are soft, round, white spots but in older patients they have the appearance of rain fallen on dust. In young persons the vision is always good but in the older patients some loss of visual acuity has usually been incurred. A second form of the first type is also characterized by white spots, but they are much finer and much more numerous. If the condition does not progress, the macula often escapes entirely, but in progressive cases it is finally affected. The second general group of macular degenerations is marked by changes beginning in the macula itself. Fine black pigment is deposited there, resembling fine grains of snuff. Vision fails early, and in the typical cases there is the effect of a central scotoma. Progress of the disease takes the form of a tapetoretinal degeneration, exposing the choroidal vessels, which later show the changes described as sclerosis of the choroidal vessels. The earlier the changes begin, the more severe the condition is likely to be, and this applies not only to the vision but to associated cerebral changes as well. This seems to be true of all hereditary ailments: the earlier its appearance, the more severe the disease is apt to be. The third form of hereditary macular degeneration resembles a partial coloboma of the choroid in the macular area. The range of vision is from very poor to even normal vision in one eye and fair vision in the other. Lesions that appear to resemble partial coloboma of the choroid might be considered lesser grades of typical colobomas of the choroid, which are sometimes familial. Senile and presenile cases, which were formerly considered separate entities, are now rated as delayed manifestations of hereditary influences and are usually less severe than those that appear earlier.

**Experimental Studies of Bacterial Cholecystitis.**—In summarizing his experimental results, Aronsohn concludes that there is little tendency for an acute bacterial infection of the wall of the gallbladder to result from the contents of that organ. Only *Streptococcus haemolyticus* gave a positive reaction, and this only in one of the four strains used. Since traumatization or extension from an adjacent pathologic process can be definitely ruled out as a cause for this change, he deduces that the organism or its toxins present in the bile reached the serosal layer of the wall by traversing the mucosal and muscular layers without causing any changes in these. None of the other organisms injected, although present in the bile in overwhelming numbers, caused any change in the wall of the gallbladder. The experimental results partly confirm and partly contradict those reported in the literature. Bacterial infection of the wall of the gallbladder was found to occur less frequently than recorded by other authors. The diverse results obtained with different strains of the streptococcus concur with the observations of Rosenow and of Magner and Hutcheson, who stressed the varying activity within this group on the basis of differences in virulence. Magner and Hutcheson divided the streptococci into two chief groups, which they classified as typical and atypical. The negative results that the author obtained using *Bacillus coli* stand in direct disagreement both with the clinical data reported by Gilbert and with the experimental work done with this organism by Italia. However, the fact that *Staphylococcus aureus* and *albus*, *Streptococcus viridans* and *Bacillus Welchii* failed to produce cholecystitis agrees in the greater part with the results reported in the literature.

**Intraperitoneal Use of Amniotic Fluid to Promote Postoperative Convalescence.**—Gelfert used a concentrated sterile fraction of bovine amniotic fluid (amfetin) in operative cases of extensive and severe pathologic conditions of the pelvis. Of 100 consecutive laparotomies, the fifty patients showing the most marked pathologic changes at the time of operation were selected for treatment with the amniotic fluid. The remaining fifty of the series were used as controls. There were three deaths in the series of treated patients. Of the treated group 80 per cent had adhesions, while only 36 per cent of the controls were thus complicated and these to a much less extent. Patients receiving the fluid were able to take and retain fluids and food earlier and in larger amounts than the

control group. They were also able to void and pass flatus earlier, unassisted by the usual methods. The group in many ways seemed happier and in better general condition than did the controls. The postoperative posture of these patients approximated more nearly normal than did that of the control patients. The hospitalization period was the same in the two groups owing to the hospital routine, but the treated group desired to be out of bed sooner, in spite of the fact that they had been subjected to more extensive surgery than had the control patients. During the course of clinical observations on the amniotic fluid, in six patients operated on, 400 cc. of sterile saline solution was introduced into the peritoneal cavity to determine whether the results obtained with the fluid might be due to the presence of a fluid in the peritoneal cavity. The reaction of these patients was not different from that of a similar group of patients having the same type of operation, followed by a hypodermoclysis of 400 cc. of physiologic solution of sodium chloride.

\*Results of Roentgen Treatment of Series of One Hundred and Nineteen Gliomas. E. Sachs, J. E. Rubinstein and A. N. Arneson, St. Louis.—p. 597.

**Mental Symptoms in Cases of Temporal Lobe Tumor.**—Keschner and his collaborators purposed to ascertain: (1) the frequency and nature of abnormal mental states in cases of tumor involving the temporal lobe, (2) the diagnostic value of such states as localizing symptoms, (3) whether the frequency and nature of the mental symptoms of a tumor involving the temporal lobe differ only from those of a tumor of the temporal lobe and its adjacent areas, and (4) whether there is any significant difference in frequency and nature between the mental symptoms of tumor of the temporal lobe and those of tumor of the frontal lobe. In the entire series of 110 patients, mental symptoms were observed in 103; in thirty-eight patients they were early manifestations of tumor. A study of the changes at operation and observations at necropsy in patients with mental symptoms revealed no definite relationship between the location and nature of the tumor and the frequency and nature of the mental symptoms. Circulatory disturbances followed by secondary softenings in the brain tissue immediately adjacent to the tumor due to direct compression of the blood vessels by the tumor, as well as circulatory disturbances in regions remote from the tumor, were found to play probably as important a part in the production of mental symptoms as the tumor itself. Seventy-nine patients with mental symptoms showed evidences of intracranial hypertension; the latter therefore appears to be an important factor in determining the fre-

quency of mental symptoms in patients with tumor of the temporal lobe. The abnormal mental reactions that occurred were sphincteric disturbances, hallucinations, changes in personality and disturbances of the sensorium, in affect, memory, orientation, intellect and higher psychic functions.

**Results of Roentgen Treatment of Gliomas.**—Their study of the results of roentgen irradiation in 119 gliomas has led Sachs and his associates to the following conclusion: Larger doses of roentgen radiation should be used in the treatment of tumors of the brain. This can be accomplished by (1) using multiple ports of entry instead of two or three, as has been done in the past (in that way it will be possible to deliver a greater total dose to the bed of the tumor), (2) employing fractionated exposures over a prolonged time, (3) raising the percentage depth dose either by increasing the target-skin distance or by using heavier filters or by a combination of the two methods, and (4) devising a safe method of giving therapy into an open cranial wound, thus avoiding the danger to the scalp and flap of bone and delivering a much larger quantity of roentgen radiation into the bed of the tumor.

### Archives of Pathology, Chicago

21: 265-418 (March) 1936

\*Morphologic Aspects of Local Schwartzman Phenomenon. I. E. Gerber, New York.—p. 331.

**Genital Staphylococcic Actinophytosis (Botryomycosis).**—Berger and his associates record a case of true genital botryomycosis of the soft tissues in a woman. The lesions were inflammatory and contained granules resembling those seen in actinomycosis but formed by clusters of staphylococci, which were sometimes associated with colon bacilli. The granules were lined by shells, partly garnished with clubs. The lesions were identical with those described in animals. In the authors' case the coexistence of colon bacilli inside the granules constituted a heretofore unknown feature. The eventual participation of these bacilli in the granule formation is discussed. They refute the identification of true botryomycosis with telangiectatic or pedunculated granuloma or hyperplastic angiomatosis in man. A survey is made of infections showing actinophytic evolution. This appears to be a biologic reaction modality of the organism and to be more frequent than is suspected. It is not restrained to fungus infections but may appear also in actinobacillosis, in staphylococcic infection and in tuberculosis. They propose to replace the name botryomycosis with staphylococcic actinophytosis. The combined analysis of the histogenesis in the present case and of the cases reported in the literature seems to indicate that the granules, shells and clubs are not a direct result or product of the pathogenic agent but seem to arise through a peculiar interaction between these agents and the surrounding exudative elements.

**Morphologic Aspects of Local Schwartzman Phenomenon.**—Gerber presents histologic studies of the Schwartzman phenomenon that confirm the reports of previous observers on the occurrence of inflammation subsequent to skin preparation. However, it can be clearly established that the inflammation is nonspecific and bears no relation to the preparedness of the skin for the phenomenon. These observations lend morphologic support to Schwartzman's concept that the preparatory factors induce a state of vulnerability of the tissues which is "not in the nature of a mere trauma, increased permeability of capillaries or inflammation, but which is probably due to some functional disturbance in the cells which requires a short incubation period for its appearance and which disappears rapidly." The phenomenon is not an expression of augmentation of the inflam-

mation present with skin preparation, since the changes in the tissues occurring in the elicitation of the phenomenon are not dependent on the preexisting inflammation but rather on the actual preparedness of the skin. While the fixation of intravenously administered substances at the site of a local inflammation may play a part in the appearance of the phenomenon, this is only an incidental factor. Chemicals or neutralized filtrates cannot prepare the skin for the phenomenon, and the local inflammation produced by them is unaffected by intravenous injection of reacting factors. There is no basis for considering allergic the inflammation seen with skin preparation in the Schwartzman phenomenon. Although certain morphologic similarities exist between the phenomenon of Arthus and that of Schwartzman, they can be accurately differentiated immunologically and, to a certain degree, morphologically.

**Reconstruction of Pendulous Breasts.**—Thorek's technique for the reconstruction of pendulous breasts consists of 1. A supra-areolar convex incision over the anterior hypertrophied and pendulous gland with a second, similarly directed incision beneath the global mass. 2. The removal between these incisions of as much glandular and adipose tissue as is deemed necessary to obtain the desired size and contour. 3. Free circular detachment of the nipple and areola through a circular superficial incision. The subdermal tissues of the nipple must be treated with utmost gentleness. Transplantation of the nipple is then made into a bed prepared at a site selected previously. In the great majority of his cases thus treated there was clinical evidence of good cosmetic result and there was no doubt regarding the viability of the freely transplanted tissue. Surgeons desiring to relieve these patients should acquaint themselves thoroughly with the anatomicopathologic factors underlying the abnormality and the methods for their relief. Patients should be told that with transplantation of the nipple lactation is precluded. When the pendulosity is moderate a transposition operation may be carried out successfully.

**Blood Pressure Variability.**—Hoverson shows that variations in blood pressure, sometimes of great magnitude, occur in the normal healthy person. Determinations were made daily on four patients, selected on the basis of their cooperation and behavior. Their daily life and manner of determination was standardized as well as possible. The leptosome patients show the greater number of changes, while pyknotic patients show fewer changes, and the changes in themselves are less abrupt. This relationship has been found to be quite constant. A critical analysis of the variations shows that there is operative some common factor, for in general all patients show similar periods of increased or decreased pressures. In some instances the changes are quite abrupt, while in others they are accumulative. Possibly the meteorological state may have something to do with the conditioning of the blood pressure responses. However, it is at the most only one of the many factors. Fur-

ther study is indicated in an effort to account for the individual variations. From the form of blood pressures, the author can conclude only that the usual method of recording the blood pressure of say 120/80 is almost valueless. The single reading might be taken at a time when the patient was at a peak or a low level or any point between. It seems that the only logical method then should be to take a series of readings, graph them and draw conclusions from the composite picture. In the conclusions should be considered such things as the frequency of the variations, the type of variation and the magnitude of the changes. Obviously, a person who shows few changes and in whom the changes are minimal is more stable than one who shows abrupt, frequent and maximal variations.

**Inactivated Yellow Fever Virus as an Immunizing Agent.**—Gordon and Hughes state that yellow fever virus inactivated by heat, by exposure to ultraviolet radiation or by formaldehyde did not possess any demonstrable immunizing property. In these experiments immunity, when it occurred, was the result of a demonstrated infection. Neither a solid nor a partial immunity followed the parenteral injection of large amounts of inactivated virus.

**Cytoplasmic Inclusion Bodies in Human Throat.**—Broadhurst and her associates state that cytoplasmic inclusion bodies may be demonstrated in human throats and other parts of the upper respiratory area. A relatively high proportion of

persons with certain of the milder respiratory irritations are positive for these inclusion bodies. Carriers of these inclusion bodies may show an increasingly heavy incidence in the epithelial cells of the throat—both in the number of cells affected and in the number of bodies per cell. These inclusion bodies are rarely present in epithelial cells that contain bacteria. They are easily demonstrated in epithelial cells of affected persons; but they do not persist, in the same form at least, outside the host cells. These epithelial inclusion bodies seem acceptably classified as inclusion bodies: they multiply only when living tissue is available. They stain pink with Giemsa's stain (after Zenker's fluid). An aggregate structure (as in Negri bodies of rabies) and a capsule may be demonstrated by appropriate stains. Special stains have been developed for their ready differentiation from other cell parts and constituents and extraneous material, notably nigrosin-sodium chloride for throat specimens and methyl green-pyronin for embryo chick cultures.

**Vaccination Against Tuberculosis.**—Corper and his co-workers show that in animals there is a retardation of virulent tuberculous infection resulting from a previous vaccination with viable avirulent human and bovine tubercle bacilli. Avirulent tubercle bacilli in amounts exceeding 0.001 mg. of fine suspension per cubic centimeter produce in man and animals definite intracutaneous local lesions similar to those resulting from the injection of the same nonviable tubercle bacilli. The extent of such local lesions in man and the slow retrogression of these would not seem to warrant the use of excessive amounts of these bacilli as has been done in the past for producing immunity. Avirulent human or bovine (BCG) tubercle bacilli do not produce progressive lesions when injected intracutaneously in man and, when injected in amounts capable of causing tubercle without ulceration (0.01 mg.), lose their viability in these lesions within about six months. Likewise, large cutaneous local ulcers completely heal with scar formation in approximately six months. The reactions to viable avirulent tubercle bacilli in man, used in amounts revealing visible changes, show a sequence of changed reaction on repeated monthly injections similar to the changes noted in animals and occurring coincidentally with the development of artificial immunity in these animals. There is an apparent paradox resulting from this reaction in that the lesions produced by small or large numbers of virulent tubercle bacilli are retarded by the immune reaction as a result of preventing or retarding the multiplication of virulent bacilli. There exists a biologic specificity of the immune reaction in animals with avirulent bovine tubercle bacilli against virulent bovine infection which would suggest a greater efficiency from the use of avirulent human tubercle bacilli against virulent human infection. For this reason perhaps a mixed vaccine for human purposes deserves consideration. When viable avirulent tubercle bacilli are to be used for vaccinating, an amount of bacilli should be used well within the range of producing a visible reaction and yet not excessive to the point of producing abscesses.

**Hematomyelia Secondary to Hemangioma.**—Buckley reports a case of hemorrhage into the substance of the spinal cord. The hemorrhage was spontaneous; that is, it occurred without external injury or unusual physical exertion. The hemorrhage constituted the terminal outcome of an intramedullary angioma, which until a week before the patient's death produced no marked discomforting subjective symptoms and therefore was not diagnosed during life. The conspicuous feature existed in a mature type of vessel, both venous and arterial, with the three tunics of the vessel walls clearly differentiated, and in a few instances thick walled but degenerated arteries,

that is, showing definite hyaline changes in the muscular coat. It is very likely that the hemorrhage into the substance of the cord resulted from rupture of one of the hyalinized blood vessels or of the thin wall of a cavernous channel or both. Furthermore, it is apparent that the anomalous vascular development had existed from early life, judging from the mature forms of arteries and veins in the hemangioma, some of which were of unusual size and thickness of their walls, some of which had undergone degenerative change. The fact that the patient suffered little or no inconvenience from an extensive invasion of the substance of the spinal cord by vascular hyperplasia furnishes a striking example of the adaptability of the nervous structure to mechanical interference. The patient had complained from time to time of pain in the region of the shoulders and arms. With the exception of the pain that was regarded as "rheumatic," the patient was well until eight days before death, when he awakened with severe pain in the right arm, followed by weakness and complete loss of motion in the legs. He was admitted to the hospital three days later with complete motor and sensory loss in the affected limbs, retention of urine, bloody spinal fluid under pressure of 8 mm. of mercury and subsequently severe pains in the legs made worse by passive movement and, later, vomiting and respiratory difficulty. The course of the malady terminated in death. The paralysis was the result of secondary hemorrhage originating in an embryonal developmental anomaly—an angioplastic hypertrophy.

**Antagonism Between Ephedrine and Procaine.**—Isenberger and Rice tested the efficacy of ephedrine sulfate as an antagonist to procaine hydrochloride by limiting the actions of the drugs, partially and temporarily, to the medulla. Localization was accomplished by cisternal injection, which rules out some of the complicating factors that are produced by rapid excretion, detoxication and differential fixation following other methods of administration. The resistance of the circulatory centers to procaine depression was generally greater than resistance of the central respiratory mechanism. Anoxemia is apparently the most damaging factor in circulatory depression accompanying procaine respiratory paralysis, and adequate artificial respiration is usually definite protection against this anoxemia. This contention is supported in the experimental

results obtained by Isenberger (1930), in which he demonstrated the value of artificial respiration and administration of oxygen in respiratory and circulatory depression following intraspinal and intravenous procaine poisoning. It is evident that ephedrine is antagonistic to procaine by actions other than its peripheral circulatory effects. Improved circulation from intracisternal ephedrine cannot always be entirely responsible for the early return of spontaneous breathing in animals with respiratory paralysis induced by intracisternal procaine. Ephedrine stimulated nervous structures subserving depressed reflexes almost instantaneously in these experiments. Important experimental evidence on this subject has been presented by Schmidt and Wright. Whether the procaine found its way into the central nervous tissue through open foramina or was transported by obscure physicochemical processes, rapid respiratory paralysis and abolition of higher reflexes were obtained consistently.

**Hematology of Tuberculosis.**—Miller states that the value of the blood sedimentation rate in tuberculosis cannot be estimated too highly. However, it is specific only of cellular (tissue) destruction and is not diagnostic or prognostic. It is an indicator of pathologic activity. The rapidity of rate is directly proportional to the amount of activity. The severity of the disease may be further evaluated by plotting a curve of the rate of sedimentation against the time interval; viz., a horizontal line is normal, a diagonal line shows mild activity, a diagonal curve moderate activity, a vertical curve marked activity. In cases in which the clinical and roentgen signs are indefinite, it is invaluable. The prognosis, the degree of activity and the efficacy of therapy can be obtained only by consideration of a series of successive correlated studies of the Schilling test, blood sedimentation rate and monocyte-lymphocyte ratio. Just as these tests may reveal activity before the clinical evidence is detectable, in the same manner the pathologic state is persistently detectable after clinical quiescence. The laboratory is merely offering procedures that aid in the demonstration of the presence or absence of pathologic activity.

**Thrombocytopenic Purpura.**—Boas and Erf present two cases that illustrate unusual reactions to rather common drugs. The first is one of symptomatic thrombocytopenic purpura caused by allylisopropylacetyl carbamide (sedormid); the second illustrates thrombopenic and febrile reactions that may follow the administration of phenobarbital. Sensitivity may become manifest after long usage of a drug, and symptoms frequently develop when a drug is again taken after having been discontinued. Many unexplained mouth ulcers, bleedings, headaches and fevers are due to such drug sensitivity. Purpura has been observed following the administration of many drugs, such as quinine, neoarsphenamine, iodides and phenobarbital. The authors' patient, who had been taking phenobarbital, first developed fever, then a diffuse maculopapular rash, and purpura appeared only four days later. The same sequence occurred in a reported case of drug purpura. Subsequently when the patient was tested against the drug she promptly became febrile taking small doses, but no rash appeared nor did the blood platelet count fall. The patient who developed thrombocytopenic purpura following medication with allylisopropylacetyl carbamide is more instructive. The case again illustrates the fact that typical severe purpura may be only a symptomatic manifestation of drug idiosyncrasy. This must always be borne in mind, particularly when there are repeated bouts of purpura with spontaneous recovery. In this patient the appearance of purpura coincided with her menstrual period on two occasions. This might lead to the suspicion of some endocrine factor provoking the blood dyscrasia. Self medication for the relief of menstrual pain or discomfort is so common among women that "allergotoxic" symptoms recurring periodically with the menses should always arouse the suspicion of drug idiosyncrasy. Transient monthly recurring disorders in women, particularly with gastro-intestinal symptoms or cutaneous manifestations, always call for careful investigation of drugs that may have been taken to relieve menstrual distress.

**Healing Process in Tuberculous Spondylitis.**—Finder discusses a case of extensive tuberculosis of the spine that healed under conservative treatment. The bone tissue went on to healing, so that osteosclerosis developed at the sites of skeletal lesions; in one place complete union by bony fusion occurred between two vertebrae. The tuberculous disease of the spine in this study had been existent in a quiescent stage for many years. No signs of activity were evident even at the time of death, which resulted from a marked exacerbation of pulmonary disease and a miliary dissemination of the tuberculosis shortly before the end. Healing was indicated by many tissue changes, such as fibrosis of bone marrow, osteosclerosis, bony fusion, sequestration of necrotic bone, organization of tuberculous abscesses and scarring of diseased intervertebral disks. Healing was associated with evidence of immunity of bone tissue to tuberculosis, a fact substantiated by histopathologic observations. The pathologic observations are interpreted in the light of the biologic and immunologic processes. The routine microscopic examinations of sections representing the eight vertebral segments revealed involvement. The author's explanation of healing in tuberculous spondylitis is that near a focus of destruction there is a greater concentration of toxins and therefore greater irritation of nearby bone marrow, which responds by fibrosis and osteogenesis. As the distance from the point of toxin production increases, the damaging substances become more dilute and the bone tissues react to a much less marked degree. He considers insignificant the possibility of mechanical irritation or pyogenic infection as the cause of fibrosis and sclerosis in his case. Bone healing is further manifested by bony fusion of the vertebrae and by the elimination of tuberculous necrotic bone areas. The tissues that react to toxin irritation by fibrosis also acquire an increased resistance to infection by the tubercle bacillus. Evidence to substantiate this statement is furnished by the ability of miliary tubercles to invade myelogenous bone marrow and their inability to develop in places in which the marrow spaces are filled with fibrous tissue. When miliary dissemination occurred shortly before the patient's death, the immune fibrotic areas withstood the fresh invasion and no young tubercles developed. The more remote regions, however, did not receive the benefit of inoculation with toxins; as a result the tubercle bacilli found susceptible tissue in the regions of hematopoietic bone marrow, in which young tubercles were seen with relative frequency. Although the general picture is one of quiescence of the tuberculous process, certain areas show activity: osteoclasia occurs in relation to abscesses and traumatization. Fibrous tissue

develops in an attempt to organize abscesses and even invades the caseous tissue of a tuberculous sequestrum in an attempt to resorb and organize it. The infection in the intervertebral disks heals by fibrous tissue scarring. In some places motion persists in the intervertebral space after destruction of the disk and, by mechanical irritation, tends to transform simple fibrous tissue into a primitive intervertebral disk.

**Cholangiography.**—Robins and Hermanson modify the technic of Mirrizi by injecting the radiopaque medium into the duct before it is disturbed and by substituting hippuran in place of iodized oil. They have used the method in twenty-five cases. The first roentgenogram failed to agree in only one case with the exploratory observations and check-up roentgenogram. In this instance the dye stopped abruptly at the ampulla and failed to enter the duodenum. The impression was that obstruction probably existed at the ampulla, but exploration and check-up roentgenograms revealed that the duct and ampulla were patent. In four instances the pancreatic ducts were visualized, and chronic pancreatitis, as evidenced by enlargement and hardening of the gland, was found on exploration. These patients continue to complain of symptoms in whole or in part, and the authors believe, therefore, that this observation is of prognostic significance. No untoward reactions have been encountered as a result of injecting hippuran into the bile ducts. This procedure is intended to furnish information not available by any other diagnostic method in present use. Since extremely small stones and so-called sand bile will not show on the roentgenogram, judgment as to what should be done in cases in which the evidence is not clear cut will depend as heretofore on the clinical evaluation of the case arrived at after thorough diagnostic study. A complete study should not be omitted even if this method is to be employed. The only contraindication to this procedure is the presence of acute infection in the biliary tract. Roentgen visualization of the bile ducts according to the technic described interferes in no way with the conduction of the operation. On the contrary, by providing the surgeon with visual evidence it should be of considerable value. This is especially true in the case of common duct obstruction due to stone. With further experience it should likewise provide valuable information in such conditions as neoplasm of the bile ducts, neoplasm of the head of the pancreas, hepatic stone, cholangitis, diverticula of the bile ducts, internal biliary fistula and stricture.

**Pathologic Fractures Due to Malignant Disease.**—In order to clarify the subject of pathologic fractures due to malignant disease, Welch studied the entire series of sixty-six pathologic fractures observed in the Pondville Hospital since 1927. No evidence of healing was obtained in fifty-three cases. Experimental study reviewed shows that treatment of a simple fracture with moderate doses of x-rays accelerates healing. Healing with firm union occurred in 5 per cent, 9 per cent showed moderate healing, 6 per cent healed slightly and no evidence of healing was obtained in 80 per cent. Of the nine fractures that healed, either fully or moderately, six received roentgen therapy to the bone after the fracture. The average length of life following fracture through carcinoma was slightly less than six months. After fracture through osteogenic sarcoma, the length of life averaged slightly more than a year.

Needles in Feet: Method of Removal in Difficult Cases. E. I. Lloyd.—p. 310.

**Puerperal Sepsis and Surgery.**—Bonney concludes that, if the number of sporadic cases of puerperal sepsis is to be diminished, obstetrics must fully adopt the methods of surgery in its already largely successful efforts against sporadic post-operative sepsis of intrinsic origin. These methods may be summed up as the sterilization or, if sterilization is not possible, the exclusion from the field of action of the approaches to the operation area, the avoidance of unnecessary trauma and unnecessary hemorrhage in that area, and the removal beforehand of septic foci in other parts of the body. To these, it is to be hoped, the future will add reliable immunization of the patient before the operation. Hopeful results from the use of antistreptococcus serum in cases of labor in which sepsis after delivery was specially to be feared have recently been reported by Thomson.

**New Treatment of Fibrositis.**—Scott discusses the pathogenesis and the inadequacy of the focal theory in fibrositis. The observation that under certain conditions of irritation the fibrositic nodule apparently introduces toxic material into the circulation when the original focus of infection has long been removed must suggest that it has itself become a focus, secondary to the infecting focus, but needing no reinforcement for its effective existence. If such a conception is dismissed as mere conjecture, it may be found difficult to explain a phenomenon which the author observed when local treatment was instituted to raise the local resistance of the attacked muscle and to eliminate the fibrositic mass. An oil suspended vaccine, prepared by the addition of dried streptococcus substance to olive oil, was injected into the inflamed tissue. Within a few hours the area became hot and tender, and the same malaise and evening pyrexia, but both more marked, occurred as when massage was applied or iodized oil injected. At the end of a few days all symptoms subsided abruptly, leaving the fibrositic area comparatively painless and no longer obvious to the fingers. Accompanying this local change a most marked gain in general health was often observed. Persons who had been in poor condition for years regained their normal color and appearance in a week or two and recovered a vigor and activity they had been resigned to losing. Not all were so fortunate, for the improvement was seen only in patients less than 30 years of age and only when the fibrositis was of great severity and long standing. When it did occur, as in perhaps half the cases, the change was exceedingly remarkable. It was not forthcoming when the oil was injected into healthy muscle or into a fibrositic area in which the inflammation was slight. The lipovaccine was made up in two strengths, representing one and ten million organisms (polyvalent streptococci isolated from rheumatic patients) suspended in sterile olive oil. Apart from systemic benefit and from conjectures as to its meaning, the injection of lipovaccine caused a more or less complete disappearance of

the local disability in eighteen of twenty-five cases, a partial improvement in three and no result in four. Of the last four, two persons were more than 60, and in two chronic lumbago was associated with old scoliosis. Almost every patient had suffered for more than ten years.

**Treatment of Pernicious Anemia with Dakin and West's Liver Fraction.**—Ungley and his associates treated thirty-six cases of pernicious anemia with the Dakin and West liver fraction. The material has been compared with other liver preparations in respect to the production of reticulocyte responses, increase of red blood cells and clinical improvement. The results indicate that the fraction is highly active for blood regeneration in pernicious anemia. Total quantities of from 1 to 6 cc. (100 to 600 mg., average amount 359 mg.), administered usually in divided doses to eleven patients with initial red blood cell counts below 2 million per cubic millimeter, were sufficient to cause an average increase of erythrocyte concentration amounting to 2.31 million in forty days. Good responses followed the administration of amounts sometimes as small as 10 mg. daily or from 100 to 200 mg. as a single dose. For maximal reticulocyte responses and for the production of red blood cells at a maximal rate, larger doses were usually required. There are not sufficient data to assess quantitatively the potency of the preparation as compared with other liver extracts, but in the authors' experience no other liver extract given in the small amounts used in this investigation has produced such striking results. Preliminary observations suggest that this highly purified fraction may prove to be at least as potent as other liver extracts in the treatment of the neurological manifestations of pernicious anemia.

**Antianemic Principle of Liver.**—Wilkinson confirms the fractionation (Dakin and West) of liver extracts containing the antipernicious anemia principle by means of Reinecke acid to yield a more highly potent fraction. By the use of this method, products have been obtained of which 58 mg. produced a maximal reticulocyte response and a rapid remission in a patient with pernicious anemia. Applying this method to other methods of separation, a further increase in hematopoietic potency has been secured so that as little as 18 mg. of the product has been sufficient to initiate a maximal reticulocyte response and rapid remissions in pernicious anemia.

**Surgery in Elderly Patients.**—Newton discusses the results of 100 major operations, performed on patients more than 70 years of age. The main groups of diseases were cholelithiasis, carcinoma of the breast, hypertrophy of the prostate, abdominal carcinomas, acute abdominal emergencies, direct inguinal hernias and various miscellaneous diseases. Problems relating to the surgical management of each of these groups are reviewed. The preoperative and postoperative treatment of aged patients is discussed. There were eight deaths in the series. Sixty-six patients are alive and well at periods from a few months to ten years after the date of operation. It is suggested that the age factor should not be given undue consideration when operative measures are necessary.

**Pericardial Puncture.**—Marfan discusses several aspects of pericardial puncture. The difficulties in the diagnosis of pericardial effusion are often real. There are several routes by which a pericardium may be punctured, but he considers especially and in detail the subxiphoid route. There are some advantages in this route and only two principal contraindications for its use: excessive abdominal tympanism and deformity of the lower border of the sternum. He concludes from his discussion and study that, if the existence and abundant nature of pericardial effusion is suspected, it may be necessary to make a pericardial puncture. The subxiphoid epigastric route, if a rigorous technic is followed, offers less difficulty and danger than other methods.

Functional Stenoses of End of Small Intestine in Nursling. P. Lombard.—p. 179.

**Venous Ligation in Septic Diseases of Extremities.**—Napalkow and Chein-Cheifitz distinguish two types of venous ligation. The first is that done during the course of phlebitis or thrombophlebitis in which the infection is localized and which is aimed at the prophylaxis of embolism, ascending phlebitis and septicemia. The second is performed during septicemia. The anatomopathologic studies of the conditions mentioned indicate that the infections progress by extension along the principal venous trunks. Hence it is not surprising that ligation of the venous branches was less successful than of the principal trunks. Ligation of the vein, better than any other operative means, is successful in interrupting the route by which a generalized infection would occur. It does not depend on the bacterial form. The most important condition to be met, however, is the choice of time and stage at which to perform the ligation. It is also important that the principal vein rather than a collateral be ligated and that the ligation be applied at a sufficient distance from the primary infection. Finally, the sheath of the operated vein should not be closed but should be left largely open. If these criteria are met the procedure is quite successful and advantageous in both types of infection.

Thiobromine in Treatment of Polyuria. E. Cominelli-Guariglia.—p. 195.

**Pulmonary Stasis and Pulmonary Tuberculosis.**—Maestrini says that stasis of the pulmonary circulation originates in mitral insufficiency or in pulmonary tuberculosis more frequently than in other abnormalities of the heart and pathologic conditions of the heart and lung. There is no roentgen or clinical characteristic picture proper of pulmonary stasis of pure mitral origin. In cases of pulmonary stasis in which mitral insufficiency and parenchymal lesions of the lung are proved by the electrocardiogram and by the roentgen examination of the lung, the differential diagnosis of the origin of the stasis is based on the results of the biologic tests, the most important being that for the detection of tubercle bacilli in the sputum. The hypodermic injection of Koch's old tuberculin comes next in importance. If there is a local and a general reaction to the tuberculin test, the pulmonary stasis is certainly of tuberculous origin. The Pirquet and Mantoux reactions are of no value for tuberculosis in adults, except in certain special conditions.

**Catalase Reaction of Feces in Intestinal Disturbances.**—Following an evaluation of Triboulet's reaction, Kemp and Andersen call attention to Norgaard's catalase test and stress its importance. Then they describe the catalasometer devised by Kemp for the quantitative determination of catalase and report their experiences with it in the course of the examination of the feces of 1,716 patients with intestinal disturbances. They found that on the basis of the catalase values intestinal disorders can be classified into two groups: (1) intestinal disorders in which increased catalase content of the feces is comparatively rare or slight and (2) intestinal disorders in which the increase in the catalase content is comparatively frequent and severe. To the first group belong patients with chronic constipation, fermentation dyspepsia, chronic mucous colitis and gastric achylia with constipation. The intestinal disorders of the second group are acute enterocolitis, the dysenteries, chronic proctitis, intestinal cancer and intestinal tuberculosis. The catalase reaction is not a specific reaction for inflammations but merely a cell reaction which, in its pathologic form, appears in all disturbances that cause an abnormal cell admixture to the intestinal contents. Its diagnostic significance in intestinal disorders lies in the fact that it directs attention to the possibility of the existence of a serious organic disorder. This is the case especially if the catalase content is greatly increased and this increase is demonstrated in repeated examinations. If the increase in the catalase content does not tally with the other clinical aspects, a thorough examination of the intestine is necessary (roentgenoscopy, rectoscopy and so on). If the catalase values are constantly normal, a severe intestinal disorder is not likely, but they do not exclude such a disorder definitely, especially in cases in which a latent intestinal tuberculosis seems possible. The authors think that the catalase test is indicated in all chronic diarrheas (with or without a simultaneous achylia), in persistent constipation colitides, particularly in those with proctitic symptoms, in cases in which intestinal cancer or tuberculosis is suspected, in acute specific infections of the intestine, particularly during the period of convalescence, for the purpose of controlling the therapeutic results, and, finally, as a complementary examination to the search for cysts in chronic (or acute) amebic dysentery.

**Diabetes Mellitus and Pregnancy.**—Kraus points out that pregnancy is comparatively rare in diabetic women and sees the chief cause for this in the severe regressive changes that take place in the ovaries. The most important change is atrophy of the follicle apparatus; but, although these changes explain the sterility of the diabetic woman, it is not entirely clear how these atrophic changes develop. Inquiry as to their cause directs attention to the hypophysis as the incretory organ that controls the gonads. In this connection the author mentions the studies he conducted in the course of necropsies on young diabetic patients. He observed a reduction in the weight and in the eosinophil cells of the hypophysis. In view of these changes, particularly in the anterior lobe, he assumes a reduced functional activity of the hypophysis and ascribes the regressive

changes in the gonads to a reduced production of the gonadotropic hormone. Although a large number of diabetic women are sterile, diabetes and pregnancy nevertheless concur and in the majority of these cases the diabetes existed before conception; but there are also cases in which the diabetes appears after onset of the pregnancy. In the latter cases the increased calls of the pregnant organism on the pancreas as well as on the other endocrine organs may lead to the manifestation of a formerly latent diabetes, and the diabetes may again disappear at the end of the pregnancy. The author discusses the exacerbation of diabetes during pregnancy, pointing out that it usually appears during the early stages of pregnancy, whereas during the second stage the danger which the diabetes represents for the mother is lessened. This improvement during the later stages of pregnancy is often ascribed to the compensatory action of the fetal pancreas. However, during delivery, puerperium and lactation the diabetes is often once more exacerbated. On the whole, women in whom pregnancy improves the diabetic condition are in the minority. To be sure, since the introduction of insulin the prognosis of the diabetic mother has been considerably improved. Insulin therapy involves the danger of hypoglycemic coma, particularly during the first days of the puerperium but also during pregnancy. In order to avoid excessive insulin dosage and with this the danger of hypoglycemic coma, the blood and the urine must be kept under constant control. Diabetes is even more unfavorable for the infants than for the mothers, the mortality of the infants being still extraordinarily high in spite of insulin therapy. On the other hand, diabetic mothers have comparatively often overdeveloped infants (20 per cent compared to 3 per cent in normal mothers). The majority of authors see the cause of this overdevelopment in the hyperglycemia of the mother.

#### Treatment of Pulmonary Abscess with Short Waves.—

Schliephake states that he tried short wave therapy in cases of pulmonary abscess in which surgical treatment seemed inadvisable. Since his material varies greatly in regard to etiology and to localization of the abscess, he gives a number of case reports. These histories indicate that he used wavelengths of 6 and of 12 meters. Occasionally he began with lesser energies and shorter durations and gradually increased both, the durations up to twenty or thirty minutes. The intervals between the treatments as well as the total number differed in the individual cases. Patients received treatments every day, every second day or twice each week. Improvement was often noticeable after a few treatments, but the total number of treatments was sometimes twenty and even more than thirty. The author also cites others who used short wave therapy successfully in the treatment of pulmonary abscesses. He says that the experiences of Liebesny indicate the importance of the proper technic, pointing out that his efforts failed as long as he used apparatus with inadequate efficiency but were successful as soon as he used a different apparatus with correct adjustment of the electrodes. This same point, namely, the importance of the proper apparatus, the author stresses once more in the conclusion, pointing out that the apparatus must have great efficiency over a great air distance. He cites Fiandaca's observations on twelve patients with gangrenous pulmonary abscesses. He emphasizes that reported results indicate that large suppurations may be absorbed under the influence of the short wave field. Moreover, this method of treatment does not tax the patient like a surgical intervention, for instance, and it was found that even patients with cardiac insufficiencies tolerated the treatment well. The general condition was frequently improved after the first treatment. Another important factor is that the majority of cases healed without any undesirable sequels. To be sure, in some cases the subsequent roentgenograms revealed a slight, diffuse turbidity, but in many cases later roentgenoscopy disclosed nothing indicative of a former disorder. The pulmonary abscesses were of various origins (pneumonia, influenza, aspiration of suppurating material, embolism, suppurated echinococcus and bronchiectasis). It was found that the bronchiectatic processes take a somewhat singular position, since they do not react as favorably and as rapidly as the abscesses of different origins.

Experiments with Analgesic Action of Cobra Toxin. J. Seifer.—p. 527.

**Surgical Treatment of Hammer Toe.**—According to Regele, hammer toe is a rather common foot deformity, and particularly in persons whose occupation necessitates much standing the pains in the contracted joint are severe. Moreover, infections from cutting the corn, suppurating bursitis and fistulas are rather frequent. Congenital hammer toe, which usually involves the second toe and often appears in several successive generations, accounts for only a small percentage of cases of hammer toe and rarely causes complaints. A small proportion of the acquired hammer toes are the result of disease or trauma, but the greatest number is caused by static-vestimental factors and involves chiefly the fifth, fourth and third toes. The great toe may likewise be involved. The little toe is most frequently affected but the discomfort is usually bearable, whereas the contractions of the fourth and third toes are usually extremely painful. The author explains the anatomic aspects and the development of hammer toe and points out that, after the contracture has become rigid, only surgical treatment will correct the condition. The surgical treatment is quite simple, so that it can readily be done by a practitioner experienced in minor surgery. The author employs a modification of Hohmann's method. He emphasizes that an existing bursitis must heal before surgical intervention. Under local anesthesia a longitudinal incision is made, beginning a few millimeters distal to the middle phalanx and extending over half the length of the basal phalanx. The corn is incised with the other tissues. The head of the basal phalanx is exposed without severing of the lateral ligaments. The head and the adjoining portion of the basal phalanx are cut off. Tendon suture and fixation of the toes with splint or plaster are unnecessary. The superfluous skin on the dorsum of the toe disappears and the two bones become joined in a tight new joint with cicatricial shrinkage of the lateral ligaments and of the periosteum that was left behind. The tendons become adjusted to the shortening without special intervention. The author employed this operation with satisfactory results on more than 100 patients (often bilaterally and on several toes).

**Results of Mild Concussions of Brain.**—Reuter admits that mild concussions of the brain are occasionally tolerated without requiring treatment. This is proved particularly by numerous sport injuries, in which concussion of the brain with short loss of consciousness and vomiting passes off without treatment. The same can be said about slight brain traumas during childhood. On the other hand, it cannot be denied that after mild, apparently negligible head injuries symptoms may persist for several weeks and even for months. The author illustrates this with cases in which the patients themselves did not regard the brain trauma as serious. The usual complaints in these cases are headaches with vertigo, nervous irritability, depression, fatigue, the feeling that the mental faculties are declining, excitation and distraction. Then there are sympathetic manifestations, such as sweating, cold, damp hands and feet and other vasomotor phenomena. The vertigo is probably the result of a central vasomotor disturbance. The blood pressure is frequently below 100 mm. of mercury. All these symptoms must be ascribed to an impairment of the central nervous system, whether there are histologically demonstrable changes or not, for not every functional disturbance of the central nervous system causes anatomic changes. The impairment is reversible, for it disappears within several weeks or months. In some cases there seems to exist a cerebral swelling accompanied by symptoms of increased intracerebral pressure. In addition to headaches and vomiting there is slowing of the pulse, rigidity of the neck, Kernig's sign and venous stasis in the fundus of the eye. The swelling of the brain is often favorably influenced by intravenous infusion of hypertonic solutions. Moreover, the signs of intracranial pressure do not

necessarily appear immediately after the trauma but may develop several days later, particularly if the patients take up their work again without regard to the cerebral concussion. The author points out that several weeks of rest in bed is advisable, particularly in the cases in which the symptoms are rather severe, even if the trauma seemed only slight. On the other hand, the patient should not refrain from work too long, and it should be realized that, when work is taken up again, there may at first be a recurrence of the headaches, vertigo and fatigue, even though these had already disappeared during the period of rest.

Menarche, Constitution and Delivery. C. Weysser.—p. 728.  
Sterilization by High Cervical Amputation. W. Zoefgen.—p. 737.

**Menarche, Constitution and Delivery.**—Weysser's investigations are based on the fact that the time of the menarche has a considerable constitutional significance, particularly as regards the genital function. He cites Feldweg's report, which was based on a gynecologic and obstetric material of approximately 3,000 cases and in which it was proved that the incidence of menstrual disturbances, as well as of pathologic deliveries is higher in women who have a premature or belated menarche than in women in whom menstruation begins at the normal age. The author himself gained the impression that there is a difference between the disorders that develop in women who had a premature menarche and those that develop in women in whom the menarche was retarded. In order to obtain more definite information about this problem he made statistical studies on 1,115 deliveries, which revealed that there is a greater incidence of obstetric complications in women who had a premature or a belated menarche than in women with a normal menarche. Moreover, there were characteristic differences between the types of complications. Whereas in women with a belated menarche the difficulties produced by the skeletal structure are most common (narrow pelvis), in women with a premature menarche the complications of the soft parts (perineal tear, episiotomy) are most frequent.

**Sterilization by High Cervical Amputation.**—Zoefgen cites factors suggesting that a normal upward passage of the sperm into the uterine body and an undisturbed pregnancy are impossible without the cervix. Accordingly he raises the question whether simple amputation of the cervix might not be a substitute for the more complicated methods of sterilization. He states that, of twenty-four women in whom he performed amputation of the cervix for the treatment of various pathologic conditions such as cervical tears, laceration, ectropium, extensive erosions and hypertrophies of the cervix, not one became pregnant again. In these cases the amputation of the cervix had been done in the following manner: After ample dilation by means of Hegar's method in order to facilitate the subsequent Sturmdorff plastic operation, the author detaches the anterior and posterior vaginal mucous membrane at the os, joins the wounds laterally by an acute-angle incision, detaches the bladder and parametrium anteriorly and laterally, incises posteriorly up to Douglas's fold, divides the cervix by lateral incisions, makes wedge-shaped excisions from the cervix anteriorly and posteriorly, and covers the anterior and posterior uterine wounds according to Sturmdorff's plastic method. The formation of the lips of the os by double threads is further secured by buried sutures of the laterally remaining wounds. In spite of the fact that the cosmetic results were always satisfactory, pregnancies never developed again, and the author concludes that the operation was responsible for the sterility, and he employed it for this purpose in two cases. However, in investigating the literature, he found no mention of this sterilizing effect of cervical amputation. In answer to the question as to the height of the cervical amputation for the purpose of effecting sterility, he says that removal of from 2 to 3 cm. of the cervical canal is adequate, but, even if the amputation would be made higher up (infracorporeal), the involved opening of the posterior Douglas space would be a comparatively slight complication compared to the abdominal

tubal sterilizations. He concedes that further observations will be necessary for a final evaluation of cervical amputation as a sterilizing operation. On the other hand, the sterilizing effect of cervical amputation contraindicates this intervention in women who are still able to bear children.

### Acta Medica Scandinavica, Stockholm

SS: 129-406 (March 20) 1936. Partial Index

- Paroxysmal Cold Hemoglobinuria. H. Björn-Hansen.—p. 129.

Meningitis in Mumps. H. Silwer.—p. 355.

**Cerebral Symptoms in Acute Myocardial Infarction.**—Kjærgaard discusses the symptomatology of acute myocardial infarction on the basis of twenty-five cases. He lists the following as the most important forms of myocardial infarction: (1) instantaneous death, (2) febrile angina, (3) the pain-free type, (4) the gastric type and (5) the cerebral type. The feature common to all these types is acute cardiac insufficiency, on which the diagnosis has to be based, as it must be remembered that every acute cardiac deficiency in adults is suggestive of myocardial infarction. The author emphasizes that, in contrast to the pulmonary and gastro-intestinal phenomena, the cerebral symptoms in acute myocardial infarction have not previously been the subject of discussion. Since among the twenty-five patients under his observation there were three in whom the clinical picture of the disease was dominated completely by the cerebral symptoms, the author wants to call attention to this type. He gives a detailed description of these three cases, in which the diagnosis was verified by the necropsy. The first presented the aspects of mental disease. The author thinks that the protracted periods of restlessness and confusion were presumably attributable to a coexistent cerebral arteriosclerosis and possibly also to small cerebral emboli from thrombi of the aneurysm. The other two cases took an acute course. One of these patients died about nine hours after the onset with epileptiform convulsions, collapse, restlessness and unconsciousness. The other patient was in coma and collapse on admission to the hospital, the condition resembling a narcotic intoxication. Death followed twenty-four hours later.

**Sedimentation Rate in Expansive Disorders of Brain.**—Ask-Upmark studied the sedimentation rate of the erythrocytes according to the Westergren method in ninety-three instances of verified expansive lesions of the brain. An increase of the sedimentation rate above 20 mm. in one hour was registered, particularly in malign gliomas of the cerebral hemispheres and also in metastatic tumors, tuberculomas, brain abscess and subdural hematoma. A sedimentation rate not exceeding 10 mm. in one hour may occur not only in the conditions already mentioned but also in a series of comparatively more benign conditions (meningiomas, astrocytomas, oligodendrogliomas and angiomas). The tumors of the pituitary of parapituitary region frequently presented an obvious increase in the sedimentation rate in spite of the clinically comparative benign character of these cases. The possibility that this may depend on a central influence is briefly mentioned. From the practical point of view it may be said that, if a tumor is diagnosed in the cerebral hemisphere and if the patient has no fever, an increased sedimentation rate indicates a clinically more malign condition, whereas a fairly normal sedimentation rate does not exclude the presence of such a condition.

**Regulation of Blood Formation.**—Vlados and his associates describe their studies on dogs, conducted in order to find answers to the following problems: (1) whether anemia develops in case of partial, subtotal or total resection of the stomach and what are the duration and character of such a disturbance, (2) the exact location of the production of Castle's antianemic factor and (3) the nature of the factor that regulates the blood formation by the stomach. They found that

an anemic status developed usually in case of total resection of the stomach of dogs, as well as in case of extensive subtotal resection in human subjects. The type of the anemia that develops seems to depend on the constitutional peculiarities of the organism in question, for in some cases the anemia is hypoplastic, while in others it is hyporegenerative (chlor-anemia) or resembles pernicious anemia. The resections of the different portions of the stomach indicate that Castle's factor is produced by the fundus and pylorus, while the cardia apparently does not participate in its formation. After the removal of the pylorus, the authors observed the development of an anemia, which soon disappeared owing to the compensatory action of the ferment produced by the fundus. In case of removal of the fundus, anemia was somewhat more severe but would still pass, obviously on account of the compensating activity of the remaining pylorus. In discussing the nature of Castle's factor, the authors express the opinion that it is probably a ferment. The hormone nature of the factor has not been proved.

**Meningitis in Mumps.**—The material examined by Silver consists of fifty cases of mumps, twenty of which manifested clinical symptoms of meningitis. In addition, the spinal fluid in thirty cases of mumps without meningeal symptoms was examined. When attention was paid to the occurrence of clinical symptoms of meningitis in mumps, these symptoms were observed in from 8 to 10 per cent of all cases. They appeared from one to eleven days after the onset of the swelling of the parotid gland. No definite connection with orchitis could be discovered. The meningeal symptoms were slight or moderately pronounced, headache and stiffness of the neck being the most common. Apart from the classic symptoms of meningitis, other symptoms from the central nervous system were rare. In only one case did the clinical symptoms remain longer than six days after the onset of the meningeal symptoms. On lumbar puncture the pressure of the fluid was found to be normal in nearly all these cases. In only one case was the fluid turbid. The globulin reactions (Pandy and Nonne-Apelt) were negative or slightly to moderately positive. The number of cells in the fluid varied from 3 to 920 per cubic millimeter. The mononuclear cells were generally predominant. The highest percentage of polymorphonuclear cells was 42. In some cases without clinical symptoms of meningitis the lumbar punctures revealed nothing pathologic. In others they disclosed conditions like those previously mentioned. The changes in the fluid were observed from the day following the appearance of the swelling of the parotid gland up to fifty days later. The sugar contents of the fluid varied between 72 and 78 mg. per hundred cubic centimeters and formed between 61 and 99 per cent of the blood sugar. The prognosis was good in all cases. One case of meningitis without a definite etiology is recorded as possibly being parotid meningitis.

\*Acute Recurrent Hepatitis.—Hepatargy: Hepatargy Therapy. E. Polack. —p. 197.

**Acute Recurrent Hepatitis.**—In Polack's case of acute hepatitis a violent recurrence in connection with an angina during convalescence quickly led to hepatargy. Treatment consisted in large doses of dextrose, with from 12 to 16 international units of insulin, twice daily after the first day, at first intravenously and then orally. On the first day 1 liter of a 6 per cent solution of dextrose was also given intramuscularly. Improvement appeared after several days' intensive carbohydrate therapy, and a continued diet rich in carbohydrates and deficient in albumin, together with insulin, resulted in complete recovery. The marked hemorrhagic diathesis that occurred with the hepatargy disappeared simultaneously with the general improvement.

\*Congenital Valve Formation in Prostatic Urethra and Congenital Urethral Stenosis in Women. V. Aalkjær.—p. 229.  
Simultaneous Occurrence of Pernicious Anemia and Aplastic Anemia. S. A. Holbøll.—p. 246.

**Congenital Valve Formation in Prostatic Urethra.**—One case of this condition and one case of congenital urethral stenosis in women are reported by Aalkjær, who also cites

the eight Danish cases previously reported, five of congenital valve formation in the prostatic urethra and three of congenital urethral stenosis in women, and discusses the anatomic peculiarities of these forms of stenosis, their etiology and the resulting anatomopathologic changes. The symptoms of stenosis may be absent or indefinite, in which case the disturbance is revealed only on the appearance of uremia. Mainly for this reason the diagnosis until recent years has not been made often during life. When the disorder is borne in mind, the stenosis can readily be recognized by the aid of a normally calibrated catheter, by cystography and possibly by ureteroscopy. Mistaken diagnosis of enuresis or its sequels as nephritis is frequent, and chronic or recurrent infections of the urinary tract have been considered the basic disorder; uremic symptoms have led to confusion with gastro-intestinal or meningeal cases. Treatment of congenital valve formation in the prostatic urethra consists in removal of the valves. As in prostatic hypertrophy, drainage of the urinary tract must often precede; kidney function tests sometimes show that drainage can be limited to a few days. In the few reported cases of congenital urethral stenosis in women in which diagnosis was made during life, dilation of the orifice was done; the effectivity of the treatment is still uncertain.

\*Lymphogranulomatosis. Katrine Ebbelhøj.—p. 253.

**Lymphogranulomatosis.**—Ebbelhøj discusses the symptoms, treatment and prognosis on the basis of forty-four cases of microscopically verified lymphogranulomatosis treated in the Aarhus radium station from 1931 to 1935. The sexes were equally represented, and the ages varied from 3 to 76, the largest group being between 20 and 30 years and the next between 40 and 50. She says that, since Hodgkin's disease can also cause cavities and appear in a nodular form resembling miliary tuberculosis, there may be confusion with tuberculosis, and, when the lymphogranulomatosis is first localized in the gastro-intestinal canal, the symptoms are so varied and far from characteristic that diagnosis is not made until postmortem or at a possible operation for suspected ileus or cancer. Lymphogranulomatosis of the bones, which may occur in all stages of the disease but usually appears in the second year, is most frequently localized in the spinal column, then in the ribs and sternum, but may be found in the long bones, cranium and elsewhere. The bony system is attacked by either the lymph or the blood way or directly from the surrounding tissue, and the clinical as well as the roentgenologic and anatomopathologic picture varies. The changes generally appear in later roentgenograms as a bone-destroying process, although osteoblastic, sclerosing forms also are found, with periosteal osseous neoformations. The author states that a peculiar fair, transparent complexion with red cheeks is frequent in patients with multiple lymphoma and is always an unfavorable prognostic sign; she has not seen this characteristic described elsewhere. Dividing her material as far as possible into four groups (Gilbert and Babaianz), the first group, consisting of a highly febrile, acute form with immediate generalization, lasting up to two months and resistant to therapy, is represented by one case; the second group, consisting of cases in which there is rapid progression, poor general condition and fatal outcome in from six months to two years, by ten cases and additional ones among patients still living; the third group, with tendency to localization where recurrences are less frequent, general condition unaffected for a long period and length of life from three to ten years, by seventeen cases and probably further cases among those observed for only a short time as yet, and the fourth, with marked chronic form and length of life up to twenty-five years, by two cases. Roentgen therapy excels all other methods of treatment for immediate and continued effect, and the third group constitutes the real field for the therapy. Both general and local irradiation are used, the former mostly at times when local therapy is not indicated. Usually local treatment of glands and also of lungs, spleen and bone tissue is given, the dose varying as the superficial or the deeper tissues are treated from 1,000 to 1,400 roentgens in each series, with single doses of from 100 to 200 roentgens every day or every other day as indicated.

## PATHOLOGIC INTERPRETATIONS OF ROENTGENOLOGIC SHADOWS IN PNEUMOCONIOSIS

CHAIRMAN'S ADDRESS

HENRY C. SWEANY, M.D.  
CHICAGO

Of the various medical aids in the problem of pneumoconiosis, roentgenology should be ranked first for the most accurate qualitative and quantitative measures of tissue damage in the living patient. Notwithstanding this fact, it must be admitted that such observations are not absolute. After all, what is impressed on the mind in viewing roentgenograms is only a well conditioned illusion, usually based on long experience in observations of serial roentgenograms on patients. As a matter of fact, absolute data can be established only on direct studies of the diseased tissues, requiring not only a study of the pathologic changes but also a study of the x-ray shadows of the lesions corresponding to anatomic changes. In this manner alone may the shadows accurately be translated into damaged tissue. While the pathology of silicosis has by no means been slighted, as the extensive work of Gardner,<sup>1</sup> Kettle,<sup>2</sup> Mavrogordato<sup>3</sup> and others will bear witness, the attempt to record the morbid anatomy of the disease into roentgenologic shadows has not been so frequent. Recently Sweany, Porsche and Douglass<sup>4</sup> reported a study in pneumoconiosis, attempting to correlate the chemistry and pathology, but the further comparison to roentgenologic shadows was only briefly outlined. The plan in this work is to carry out the correlation of the postmortem observations with antemortem roentgenologic shadows and, when possible, the clinical manifestations. This has been made possible by the fact that there were complete data assembled on most of the patients studied, including chemical examinations and postmortem lung roentgenograms.

It is my aim to complete this comparative study by comparing the pathologic changes to the postmortem and antemortem roentgenograms on types that either have not been described at all or have been insufficiently emphasized.

In the recorded descriptions of the various stages of uncomplicated silicosis, there is little to add to the

standard descriptions of Irvine,<sup>5</sup> Pancoast<sup>6</sup> and others. The first stage has been described as an increase in the density and size of the hilus lymph nodes, a perivascular thickening (arborization) out toward the pleura, and a slight fine mottling in the parenchyma. In the second stage there are the typical nodular shadows, from 2 to 6 mm. in diameter, scattered out from the hilus, usually more numerous on the right. These shadows are usually round or oblong, with a soft even density. Finally, as these shadows become more numerous or coalesce into larger masses, the condition is classed as the third stage.

In a series of films on various forms of pneumoconiosis, however, these classic forms are really not common. The pathologic condition is frequently altered by various combinations of dust or commonly by infection, particularly tuberculosis. In silicosis the tubercle bacillus alters the disease considerably, depending on the dosage of bacilli, the amount of silicosis present and the time of appearance of either one with respect to the other, as well as other factors. The varying conditions produce a series of roentgenologic shadows that sometimes simulates a fibroid tuberculosis so closely that a proper diagnosis without a history is impossible. In such cases, serial roentgenograms are the only ones of any value.

There are other forms of pneumoconiosis that have rather definite characteristics but which have not been sufficiently emphasized. For example, pure anthracosis is rather typical, but not all the characteristics of it are well recorded. The rather definite shadows of an asbestosis is in need of wider appreciation. Anthracosilicosis that gradually shades into silicosis, and a combination of silicosis, anthracosis and tuberculosis that varies with the time of appearance of the various elements and the quantities of each, also present interesting combinations of roentgenologic shadows. Other modifying factors, such as iron and clay, not to mention the many organic dusts, leave much yet to be determined. By no means have these types been definitely established.

In order to facilitate this attempt it seems expedient, as has been suggested in a previous work,<sup>7</sup> to separate the field of pneumoconiosis into a convenient and logical working classification. This plan was based chiefly on the type of pathologic change, combined with the causative agent. The principal features of differentiating these groups depends on the presence or absence of specific fibrosis, the presence of lymphatic occlusion, or the presence of the toxic agent that causes irritation. Two or more factors may be associated in the same case; such mixtures are considered in a special group.

<sup>7</sup> Sweany, H. C.. *Am. J. Clin. Path.*, to be published.

These four main divisions, therefore, with some of the principal subgroups, may be listed as follows:

- I. Coniofibrosis, including:
  1. Silicosis.
  2. Silicotuberculosis.
  3. Asbestosis and the like.
- II. Coniolympthstasis, including:
  1. Anthracosis.
  2. Siderosis and the like.
- III. Coniotoxicosis, including:
  1. Protein sensitization.
  2. Direct irritation and other causes.
- IV. Mixed processes:
  1. Anthracosilicosis.
  2. Siderosilicosis.
  3. Anthracosilicotuberculosis and other conditions.

I shall discuss these groups in order.

#### CONIOFIBROSIS

Coniofibrosis may be considered as a form of pneumoconiosis characterized by an exuberant growth

vital parts of the cell in the process of its own hydration. Since silicic acid penetrates limestone, sandstone, wood and other substances on the earth's crust and produces petrification, it is not unreasonable to suspect a similar mechanism on living cells, although living cells would be injured long before a petrification could set in.

In any event the silica is inhaled into the lungs as particles usually less than 5 microns in diameter. The particles are phagocytosed and are either expelled with the bronchial secretions or pass into and along the lymphatics. Once in the lymphatics, the phagocytes pass upward toward the lung hilus and fill the lymph node sinuses and lymphatic vessels. According to Gardner<sup>1</sup> there is considerable activity of these phagocytes, but Mavrogordato<sup>2</sup> and Policard<sup>10</sup> are of the opinion that the phagocytes are soon paralyzed by the silica and pass along with the current until they lodge where the whorls of fibrous tissue develop. The process continues until the fibrous whorls fill the lymphatics and later appear in the parenchyma. The stage of the

Fig. 1 (case 1).—a, typical distribution but unequal density of lesions, and a slurring characteristic of an encroaching tuberculosis in a silicosis. b, roentgen appearance post mortem. c, enlargement of mediastinal lymph nodes shown in rectangle of b. d, lateral section through main bronchi.

of connective tissue due to a specific irritant. Under this heading are included silicosis, silicotuberculosis and asbestosis.

**Silicosis.**—Silicosis is that form produced by the action of silicon dioxide or certain silicates, resulting in the formation of fibrous tissue, usually in whorls from 2 to 5 mm. in diameter, along the course of the lymphatics from the hilus outward toward and including the lung parenchyma. As a result of researches of Stuart,<sup>8</sup> Simson,<sup>9</sup> Mavrogordato,<sup>3</sup> Gardner,<sup>1</sup> Kettle,<sup>2</sup> Policard<sup>10</sup> and others, we are able to outline the general course of events in the development of the disease. At present the action is viewed as that of a toxic irritant. Whether it is a direct poison as a result of some physical surface phenomenon acting on the cells or an indirect one due to the solubility of the silica has not been established. Heffernan<sup>11</sup> has proposed a theory that visualizes the solution of the silicon dioxide into silicic acid, which in turn dehydrates or denatures the

disease depends on the location and number of these nodules, as already cited.

**Silicotuberculosis.**—After the entrance of the tubercle bacillus into a silicotic process, the character of the silicotic nodule changes depending on the time of appearance of the infection and the dosage of bacilli. If the infection is only recent, many of the nodules may be typically silicotic and intact, and the distribution more classic; but the longer the tuberculosis exists as a widespread process the fibrils of the whorls become blended into one mass and the whole nodule gradually takes on the appearance of a caseous nodular tubercle. Most of the cases encountered in industry fit into this group, because the tubercle bacillus is usually responsible for the termination of most cases of silicosis. Instead of the soft round or oblong shadow of from 3 to 5 mm., the nodules become larger and much denser, owing to the caseation with the gradual accumulation of calcium as the process progresses, until they become large masses or ulcerate into cavities. As the process advances it becomes more and more like a tuberculosis, until the roentgenograms are typical of this disease. Another variation due to tuberculosis is the atypical

11. Heffernan, P.: Tubercle 11: 61 (Nov.) 1929.

location of the lesions. If there is a benign tuberculosis already present, the process tends to become more exaggerated in the regions of the tuberculous lesions. Sometimes the location is confined to the upper half of the lungs and not at all like the classic distribution. In addition to the usual bilateral distribution of bronchogenic seeding, a hematogenous seeding usually confined more to the upper parts may also help to explain some

Fig. 2 (case 1).—*a*, large silicotic nodule (marked by arrows in figure 1) undergoing tuberculous caseation. *b*, a silicotic nodule without tuberculous, for comparative purposes (hematoxylin and eosin stains; reduced from a photomicrograph with a magnification of 8 diameters).

of these anomalous localizations and more particularly the benign forms with no tubercle bacilli in the sputum. Sometimes the involvement is unilateral, and sometimes it is even situated along a single bronchial ramus.

In addition to the variations in the lung parenchyma, there are changes in the lymph nodes that are of characteristic nature. Here there is an infiltration of calcium underneath the capsule, which suggested the use of the term "egg-shell calcification" in an earlier work.<sup>4</sup> The first three cases represent some of the variations caused by an associated tuberculosis:

**CASE 1.**—A Yugoslavian, aged 46, who had worked for eighteen years with a drill as a rock miner but left the mines when he was 38, had always been well until he had an attack of pneumonia in 1927, another in 1929, and a third in 1931. Physical examination when he entered the sanatorium in March 1932 revealed the following: The general development was good but he was slightly asthenic and there was a coarse tremor of the fingers. Examination of the chest revealed a slightly cyanotic skin surface and a heaving respiration; an increased tactile fremitus on the right and left base, posteriorly; an impaired resonance on the left upper third, moist râles at the left base, with cavernous breathing above. The diagnosis was far advanced B. Because special culture and guinea-pig inoculations were positive but direct smears were always negative, pneumoconiosis was suspected.

Roentgenologic examination, March 15, disclosed that the apexes were hazy, the diaphragms could be faintly seen, the costophrenic angles were not well shown, and the cardiac shadow was displaced to the left. Scattered throughout both parenchymal fields were marked areas of mottling that involved

the parenchyma out to the periphery and apex (fig. 1 *a*). Pneumoconiosis was suspected. The postmortem roentgenogram showed a large number of nodules out from the hilus and diminishing toward the periphery (fig. 1 *b*). These nodules varied in size and density from 2 to 10 mm. in diameter. They were usually round or oblong, and the larger ones seemed to be much denser than the others. The lymphatic nodes were all outlined by a faint shell-like calcification which is peculiar to silicotuberculosis.

There were numerous large slate and yellow gray nodules throughout the midportions of both lungs and some toward the apexes (fig. 1 *c*). These nodules were tough, like cartilage. The main lymph nodes out from the hilus, along the bronchi, were enlarged and a gray black with some streaks of yellow. Some of these nodes were dense and calcareous, and some of the nodules toward the base showed signs of softening.

Microscopically the lymph nodes all showed solid masses of old whorls of fibrosis, typical of silicosis. There was also a definite calcification, particularly around the borders, and a marked tendency to caseation in the centers. These lymph nodes were those which appeared on the roentgenogram. Some of the lesions showed a gradual transition from these silicotic nodules over the typical caseous tubercles (fig. 2 *a*). There was a considerable amount of emphysema throughout and a moderate amount of perivascular lymphangitis of fibrous nature.

This appeared to be a silicosis on which tuberculosis had gradually been superimposed. The important feature is that the silicotic nodules that became tuberculous seemed to increase in size and density on the roentgenogram in proportion to their tuberculization.

**CASE 2.**—An American, aged 39, had been a lead and zinc miner for fourteen years and had been out of the mines for five and a half years. The history was furnished through the courtesy of Dr. Jesse E. Douglass of Webb City, Mo. The onset of the disease occurred in 1929, when he noticed pains in the right lower side of the chest. The condition was diagnosed silicosis in September 1933 on admission to the hospital.

Fig. 3.—*a*, advanced silicotuberculosis with a marked unilateral aspect. *b*, section from the base, showing the character of the fibrosis; reduced from a photomicrograph with a magnification of 200 diameters; hematoxylin and eosin stains.

A physical examination Nov. 14, 1934, revealed on the right impaired resonance to the fourth rib and sixth dorsal spine, increased whispered voice to the third rib and dorsal spine, and bronchovesicular breathing to the bases. On the left there was impaired resonance to the third rib and sixth dorsal spine, increased whispered voice to the second rib and the sixth dorsal spine, bronchovesicular breathing to the base anteriorly and the third dorsal spine to the base posteriorly, coarse râles to the base anteriorly, and medium râles to the sixth dorsal spine.

The diagnosis was tuberculous infiltration throughout both lungs with probably some silicosis. The sputum was always positive for tubercle bacilli.

A roentgenogram taken Sept. 19, 1933, revealed a rather uniform nodulation out from the hilus on both sides. Many of the nodules were fairly typical of silicosis in size, contour and density. Others were larger, more dense or irregular. There was a huge cavity in the right upper and a smaller cavity in the left upper lobe. A picture taken fourteen months later revealed a spread of the ulcerative disease and an enlargement of the cavities in the left upper lobe. There was a marked contraction of the process upward, a fusion of many of the nodules, and in general more the appearance of a fibroid tuberculosis. At this time there was little resemblance to a silicosis.

An autopsy revealed a red gray lung with many firm pigmented hilus lymph nodes, one of which had ulcerated through the esophagus above the tracheal bifurcation, and two other areas on the lining showed some swelling and redness. There was a bilateral obliterative pleuritis. The heart had a definite erosion at the extreme apex in the visceral pericardium. The peritoneal cavity contained about 3,000 cc. of clear, straw-colored fluid. There were several large and small mucosal ulcers in the cecum. The liver was covered with a whitish

the last thirteen years, stated that he had been well until April 1932, at which time a cold and cough developed. He went to a doctor, and a diagnosis of tuberculosis was made because of positive sputum and roentgenologic evidence. There had been no contact with tuberculosis.

On examination the chest was emphysematous and barrel shaped, with retracted apexes and a flaring costal arch. There was impaired resonance in both upper lobes but hyperresonance below. There were râles in both upper lobes and in the base on the left side. There was a large cavity in the right apex. A diagnosis was made of pulmonary tuberculosis, far advanced B, with cavitation in the right, and pneumoconiosis.

A roentgenogram revealed a massive tuberculous process in the right upper and middle lobe, with ulceration and contraction (fig. 3). The aorta and trachea were pulled over. The right base and the whole left lung contained an increase in the peribronchial densities. There were many soft, flaky densities, irregular in outline and confluent in places, that resembled an acute infectious process. There were a few nodules, but they always varied a great deal in size and density. There was nothing to suggest silicosis.

The lung and pleura revealed much coal pigment. There was a large cavity in the right upper lobe which extended through the septum and into the lower lobe. There were a few cavities

Fig. 4.—a, appearance in a patient with a pure anthracosis. b, bronchiectasis, an old right apical tuberculosis, and a terminal pneumonia as viewed roentgenographically after death. c, lateral section through the bronchi of the gross specimen, revealing bronchiectasis and extreme pigmentation.

and apparently organized exudate. There was a very marked enlargement and pigmentation of the pericardial, biliary and peripancreatic lymph nodes.

The postmortem roentgenogram revealed a bilateral fibro-ulcerative tuberculosis in both upper lung fields, with many small nodules in the base that were compatible with but not typical of silicosis. They could easily pass for nodular tubercles.

In the right lung there was a large fibroid cavity with vessels crossing it, filling the whole upper lobe. In the base there were numerous silicotic nodules with not a great deal of coal pigment. The hilus nodes were a mass of fused fibrous silicotic masses that had impaled the vessels and esophagus into a rigid mass. There were several pulsion diverticula in the esophagus due to adhesions of the lymph nodes. In the left upper lobe were several irregular cavities and large numbers of silicotic tubercles. In the lower lobe these nodules became smaller and fewer.

The microscopic picture here revealed the usual type of silicotic tubercle with a chronic fibroid tuberculosis. As the process became advanced, it appeared more and more like a tuberculosis. Without the earlier roentgenogram, the history and physical examination, an antemortem diagnosis of silicosis would have been risky, if not impossible.

CASE 3—An Austrian, aged 60, who worked as a molder for thirty-five years but had been away from this occupation for

in the left upper lobe. Many nodular masses were present throughout the whole right lower and middle lobe and the left lung, which were peculiarly fibroid in character. There was nothing to suggest a silicosis.

On microscopic examination of the lymph nodes at the hilus there were masses of phagocytes full of black pigment. There was some autolysis, leaving open spaces. There were occasional patches of hyalinized fibrous tissue throughout both lungs, but not in whorl formation. The perivascular lymphatics were packed with black and brown pigment in the cells and free. Some of the masses were from 2 to 7 mm in diameter, and some were in confluent masses from 1 to 2 cm. across. They were rarely circumscribed as a typical silicotic nodule but on irregular masses of phagocytes that have originally filled the lymphatics to overflowing and have changed to fibrous tissue in situ.

Chemical analysis revealed 2.7 mg. of silica per gram of dried lung, definitely over the normal range.

This case illustrates what appears to be a non-nodular silicotic fibrosis and tuberculosis situated chiefly unilaterally. It should emphasize some of the limitations of roentgenograms of pneumoconiosis in the presence of tuberculosis.

*Asbestosis.*—Although the destructive types of pneumoconiosis are perhaps not all yet known, there seems to be good cause to list asbestosis as an entity under the general heading. This has been made possible by

the pioneer work of Cooke,<sup>12</sup> Mereweather,<sup>13</sup> Gloyne<sup>14</sup> and others. As the asbestos fibers are usually from 100 to 200 microns in length, they rarely reach the alveoli but lodge in the bronchioles. A few fibers pass into and through the wall of the bronchiole, causing a focus of involvement in and around the bases of the finer bronchioles. The pathologic disorder is not a nodule as in silicosis but more a diffuse fibrous lobulitis. The process extends out from the hilus toward the base. After a period of two or three months in the body the fibers appear to be acted on by the tissue juices, producing peculiar club-shaped "asbestos" bodies, which can be seen in the sputum or tissues. As the process begins the lesions are small and they may not be visible on the roentgenogram. Owing to the large numbers of them they become superimposed and present a finely stippled or ground glass appearance. There is a gradual darkening of the film passing out from the hilus. While asbestosis is not so prone to become tuberculous as silicosis, it does possess this hazard. According to Gloyne,<sup>14</sup> about 48 per cent become tuberculous. There is ample reason, therefore, to add to the grouping a tuberculous asbestosis, if the occasion ever demands.

#### CONIOLYMPHSTASIS

The second main group includes only dusts that act principally by blocking the lymphatics until their normal physiologic function is so impaired that normal resilience is lost, lymph drainage is impaired, and acute infections readily occur. Perhaps the most classic illustration of this was given by Zenker<sup>15</sup> in 1867 in which a woman had worked in a room of English red (red oxide of iron). Coal dust has a similar effect. In the pure inert dusts there is rarely any fibrosis, especially nodules or whorls. The dust is phagocytized and owing to the activity of the phagocytes much of it is expelled; some, however, passes into the lymphatics and up toward the hilus. In the worst types the lymphatics are completely blocked and are essentially functionless.

CASE 4.—A Pole, aged 45, was a coal miner for twenty years. There was nothing else pertinent in his early history. He had been troubled with a cough, productive in nature and associated with a pain in his chest and dyspnea on exertion for fifteen years. On admission to the sanatorium his blood pressure was 118 systolic, 68 diastolic. His chest was rather flat, expansion was limited, the respiratory movements were short and rapid, and the diaphragmatic excursion was poor. The percussion was dull over the lower lobes; auscultation revealed short and harsh breath sounds; there were rough breath sounds over the entire chest, and râles in both bases. The diagnosis was moderately advanced tuberculosis with pneumoconiosis and a suspected bronchiectasis.

The roentgenologic examination, April 7, 1928, revealed hazy apexes, a regular diaphragm, and slightly obliterated costophrenic angles. The cardiac shadow was dimmed by the haziness that involved both fields. There was a fanning out of small, irregular, soft, flaky densities on both sides at the hilus. For this reason anthracotic pneumoconiosis was suggested instead of silicosis (fig. 4 a). The postmortem roentgenogram in addition revealed an acute pneumonic infiltration in the base of the right upper lobe, a small quiescent tuberculous focus in the right apex measuring 2 cm. across, an old primary complex at the left base and hilus, and a fusosaccular bronchiectasis of all the basilar bronchi (fig. 4 b). The Wassermann reaction was positive and the sputum negative for tuberculosis. White blood cells numbered 13,750, and other signs were essentially negative.

In the lungs there were thrombi of several branches of the pulmonary artery; a bronchiectatic cavity in the base of the right upper and in the base of the middle, and many in the base of both lower lobes; a healed primary tubercle in the base of the left lower lobe; a small fibroid tuberculous cavity in the right apex; a pneumonic consolidation of the lower part of the right upper lobe with necrosis and cavity formation, and a dense, even distribution of coal pigment throughout (fig. 4 c). On microscopic examination these changes were confirmed. In addition there was a marked emphysema; the lymphatic vessel and lymph follicles were packed with phagocytes containing black pigment, and the alveolar walls were dotted with fine pigment particles. The various microscopic features are illustrated in figure 5 a and b.

#### CONIOTOXICOSIS

The third group is somewhat apart from the other types in that the irritants affect the tissues directly or after a period of sensitization to a specific protein. Most of these are acute processes such as a bronchitis or a pneumonitis. The reports of Cadham<sup>16</sup> on wheat rust and Figley<sup>17</sup> on castor bean dust apparently belong

Fig. 5.—a, section of a markedly pigmented portion of lung shown in figure 3, showing the marked accumulation of pigment in the perivascular lymphatics and lymph spaces. b, pigment in the alveolar walls (hematoxylin and eosin stains; reduced from a photomicrograph with a magnification of 450 diameters).

to this group. The roentgenographic appearance of these types has been shown by Towey and his associates<sup>18</sup> in patients exposed to spores of a fungus, *Coniosporium corticale*. The shadows revealed a distribution similar to uncomplicated silicosis, but the lesions were soft and irregular and conformed to the acini similar to an acute bronchogenic spread of tuberculosis. The disease disappeared when the patients were removed from the environment.

It is conceivable that any organic dust may produce a similar type of pneumonitis. In addition, direct irritants and caustics may be included in the same category.

#### MIXED PROCESSES

There are actually few people with pneumoconiosis who have not been exposed to a mixture of two or more dusts. Some dusts are composed of substances

like granite in which there are several silicates as well as silicon dioxide present. Others are inert, as coal and iron. Dusts in coal mines are composed of carbon and a variety of other substances including silicates and silicon dioxide. Occasionally in bituminous coal miners there is no fibrosis, as shown in figure 5. When the practice of rock dusting was carried out to prevent explosions from the carbon dust, silicosis occurred much more frequently in coal miners. In most coal miners there is a mixed process that has been termed by Cummins<sup>19</sup> anthracosilicosis. Naturally the manifestations vary with the particular locality, but in general there is a rapid accumulation of carbon with a gradual development of silicosis. The silicosis seems to be greatly retarded by the coal dust, as suggested by Cummins,<sup>19</sup> Sampson<sup>20</sup> and others. The roentgenogram is at first that of an increase in the thickness of the hilus lymph nodes and an increase in the "arborization"—thickening in the peribronchial and perivascular lymphatics due to the dust. Later nodules begin to appear in the parenchyma, which vary in size

a gradual development of dyspnea with a fairly persistent cough and occasional expectoration. Jan. 14, 1928, he was admitted to the hospital with a diagnosis of silicotuberculosis.

A physical examination revealed on the right an increased whispered voice to the second rib and the third dorsal spine, and bronchovesicular breathing to the third rib and sixth dorsal spine. On the left there was increased whispered voice to the second rib and the third dorsal spine, bronchovesicular breathing to the second rib and sixth dorsal spine, and a few medium râles to the base, anteriorly.

The roentgenographic studies extended over a period of nearly seven years and revealed the development of the large tumor-like masses. The interesting feature of these cases, especially this one, was that there were no classic signs of silicosis. The shadows appeared as loosely hanging clouds, at first filling the greater part of both upper lobes. The margins of these cloudy areas were irregular. They passed downward toward the middle of the lungs as small foggy festoons. Toward the base on the right the cloudy patches became smaller and disappeared entirely at the beginning of the lower third. On the left they followed the bronchi almost to the diaphragm, but became smaller and more scattered (fig. 6 a). The principal change over the seven years was an increase in the density of the shadows of the upper lobe out to the ribs and a marked

Fig. 6.—a, silico-anthracotuberculosis, March 29, 1928. b, appearance six years later. c, lateral section of lung showing typical tumor-like masses.

from a few millimeters to many centimeters. These tumor-like masses seem prone to appear in certain mixtures of inert dust and silicon dioxide, with or without tuberculosis. The inert dust (coal, iron and the like) seems to alter the circulation in the tissues so that a partial atelectasis results, to be followed by fibrosis, resulting in fibrous tumor, composed of fibrous tissue with phagocytes laden with dust in between the fibers. In the ordinary coal miner with low silica the terminal condition is usually bronchitis or pneumonia, but in the lead and zinc miners of the Ozarks, where the carbon pigment in the quartz is low compared to the silica, the result is a moderate anthracosis with a strong silicotic tendency. Sooner or later they are usually contaminated with the tubercle bacillus. The type of roentgenogram of these patients was first shown by Childs,<sup>21</sup> and the pathology has been described in earlier work from this laboratory.

CASE 5 (also furnished by Dr. Douglass).—A man, aged 62, a lead and zinc miner who had worked as such for seventeen years, had been out of the mines for eight years before his death. He had one brother and one sister who died of tuberculosis. For two or three years prior to 1927 he had noticed

thinning out at both bases, owing to emphysema. On the left the massive shadow began to shrink inward toward the mediastinum, leaving a sharp border of the shadow made by the outer border of the upper lobe (fig. 6 b).

After three years of alternate illness and well being, the patient began to fail permanently. In the fall of 1932 he had paroxysmal attacks of cardiac fibrillation, which became persistent during the following winter. Early in the spring of 1933 the heart was digitalized and was kept so until death. During the seven years of observation the physical signs in the chest on fifty-three examinations showed no changes. Sixty specimens of sputum were negative and three were positive for tubercle bacilli. He was found dead in bed in January 1935, presumably of cardiac failure.

A postmortem roentgenogram revealed a huge black mass in the right upper lobe, a smaller one in the apex of the right lower lobe, a large one in the left upper lobe and many small masses in an emphysematous base. There were several semicalcified masses in the hilus and bronchial lymph nodes from 1.5 to 2 cm. in diameter. An autopsy performed by Drs. William M. Kinney and Raymond Kuhn revealed that the tracheobronchial glands were large and black, as were those just below the diaphragm about the cardiac end of the stomach, the peripancreatic and the mesenteric. Suggestive small black areas were found in the spleen and possibly some macroscopic areas in the liver.

In our examination of the lungs the whole right upper lobe was black, fibrous and slightly contracted with an early excavation in the center, measuring between 2 and 3 cm. The diam-

21. Childs, S. B.: *Bull. U. S. P. H. S.*, 1917, p. 31

eter of this black mass was about 12 cm. There was a large black nodule in the apex of the right lower lobe measuring from 3 to 4 cm.; a large mass out from the hilus in the left upper lobe extending along the left subapical bronchus, measuring 5 by 7 cm.; small fibrotic nodules throughout both bases, and large calcified masses in the hilus lymph nodes (fig. 6 c). The microscopic appearance has been well shown in former work, previously cited.

Chemical analysis revealed 6.3 mg. of silica per gram of dried lung.

Judging from the period of time we were able to follow this patient, it may be assumed that this condition was forming over a period of twenty or more years. It was apparently the result of a silica exposure with a moderate carbon pigment contamination on which slowly developing tuberculosis was superimposed.

#### SUMMARY

1. A correlation of the antemortem and post-mortem roentgenograms with the pathologic changes has been attempted in various unclassified types of pneumoconiosis.

2. Tuberculosis with silicosis renders a roentgenographic examination difficult or impossible in the majority of patients affected with silicosis, because of atypical characteristics or the location of the lesions. The localization resulting from tuberculosis may be predominantly that of a hematogenous tuberculosis, situated bilaterally in the upper parts of both lungs, of a bronchogenic spread bilaterally, or of a bronchogenic spread unilaterally, and even along a single bronchial ramus.

3. The involvement of the lymph nodes are quite characteristic, forming what have been termed "egg-shell" calcifications.

4. Pneumoconiosis, resulting from a lymphatic congestion due to coal, iron, and the like differs from silicosis and silicotuberculosis sufficiently that an involvement by such inert dust may be anticipated many times on the antemortem roentgenograms.

5. When the inert dusts are combined in some yet undetermined proportions with a silicosis or a silicotuberculosis, it seems to result in a complex that possesses a variety of bizarre formations, some of which simulate single or multiple neoplastic masses on the roentgenograms.

North Pulaski Road and Bryn Mawr Avenue.

**The Early Diagnosis of Pneumonia.**—To make an early diagnosis is often to win half the battle in a case of serious illness, for as a rule treatment only fails because it is not administered sufficiently soon. Take, for instance, early pneumonia. In this disease there may be no chest signs to commence with, except widespread pain, but there are, I think, three signs which, if present, enable one to make a definite diagnosis and so to free one's mind of the incubus of the unknown. The first is the working of the nostrils, which is present even when there may be no very obvious respiratory embarrassment; and it is a sign which the best of physicians I have met, the late Dr. Ogle, continually impressed upon his clerks. The second is a pungent burning skin, which is immediately felt by the trained hand, and which may exist in the absence of a very high temperature, and for which I have never heard any adequate physiological explanation. And the third is the complete absence of chlorides from the urine. These three signs form a valuable trinity to remember, for the more one practices physic the greater is the realization that one physical sign is worth half a dozen symptoms.—Howard, Christopher: *The Art of Medicine, Lancet* 1:754 (March 28) 1936.

## INTESTINAL OBSTRUCTION DUE TO AMEBIASIS

ANTHONY BASSLER, M.D.

NEW YORK

As is well known, *Endamoeba histolytica* is an invading parasite living in and subsisting on the tissues, most often in the material found in and beneath the mucous membrane of the colon. Usually the pathologic condition noted is moderate thickening of the mucosa with surface ulcerations. In practically all cases antiamebic treatment causes a rapid reduction of the disorder, this often being one of the striking phenomena noted in the treatment of this disease. In such instances one commonly observes a complete reduction of the pathologic manifestations, the patient being apparently well, and yet cysts may continue in the stools, patients proving themselves capable hosts in maintaining both themselves

Fig. 1.—Roentgen appearance, Sept. 16, 1935.

and their amebic guests in comfort. Sometimes in these instances, with whatever antiamebic treatment and how many times carried out, *Endamoeba histolytica* cysts continue to be present and thus the potential of recurrence of clinical symptoms is always present. In the majority of instances when well treated, the disease is permanently cured and the stools continue to be negative to both the vegetative organisms and the cysts. In those in which continued negative stool examinations are not accomplished, for obvious reasons, periods of antiamebic treatments should be carried out. No case should be considered cured without two criteria being present: first, negative stools for cysts for at least six months and, second, x-ray examinations that show a normal colon. The latter to me is the most important because negative stools may be encountered, yet the x-ray examination shows the presence of lesions. Proctoscopic examinations may be added to these but are not to be depended on clinically. This is because the disease involves the rectum with manifest lesions in only 25 per cent of the instances, and even when they have disappeared cysts may be present, and the symptoms of the disease often recur.

A man, aged 50, with a nonsignificant family and personal history, was referred by Dr. Costello of Dover, N. J., for the diagnosis of abdominal cramps of one month's duration, severe enough to have kept him in bed for three weeks and only slightly benefited by treatment. Occasionally there was blood with the movements, for which laxatives were required, and after which there were three or four days of loose movements with more noticeable blood. At the first visit he gave the history of having been in Chicago during the pandemic of

Fig. 2.—Roentgen appearance, January 1936.

amebiasis and having stopped at the Congress Hotel about eight weeks before the onset of the abdominal cramps.

The examination, Nov. 3, 1933, disclosed a generally tender abdomen, mostly in the sigmoid region, a generally inflamed rectal mucosa with small, whitish areas, one of which showed the presence of the vegetative forms of *Endamoeba histolytica*, the Cleveland medium culture also being positive.

He was placed on chiniofon, developing more severe cramps the first three or four days, and made a symptomatic recovery, the stools becoming negative to endamebas and cysts on direct and culture examinations in several specimens from Nov. 20, 1933, to Jan. 30, 1934. Two months after the treatment the patient looked and felt well and had gained 30 pounds (13.6 Kg.). In monthly examinations of his stools after January 30 an occasional histolytica cyst was encountered. Having had a slight intestinal upset for several days in June 1934 he was put on a full course of carbarsone, after which the stools were negative for cysts until September 1934, when, after three days of abdominal cramps and slight looseness of the bowels, the stools were again positive to the vegetative organisms and he was put on a full course of vioform. He was not seen again until Sept. 10, 1935, one year after the former visit, when he complained of constipation that had been developing slowly over about a week's time, but which he could control by simple laxatives. No examination of the stools had been made from September 1934, the patient considering himself cured. He was reestablished on vioform and given laxatives. Two days after his last visit he left for Chicago, having had no bowel movement in the meantime. He was operated on for complete intestinal obstruction with fecal vomiting, September 17, in the Presbyterian Hospital in Chicago by Dr. H. A. Oberhelman, who sent the following report, briefly expressed:

"He was operated on as an emergency for intestinal obstruction. We, however, had occasion to do a proctoscopic examination and a colon fluoroscopy and found a definite annular obstruction at the rectosigmoid junction. At operation this

was verified as a complete, firm, annular neoplasm and I noted the entire colon thickened from hypertrophy. The abdomen was markedly distended, the distention involving the entire colon and ileum. Free but turbid fluid was found in the peritoneal cavity and the sigmoid colon and peritoneum. The peritoneum was dull from shreds of fibrin. A cecostomy was done and several specimens of stool were cultured but none were positive for amebas. He continued to improve for two weeks, when suddenly he began passing some blood and pus from the rectum. The feces were found to be full of amebas. Vigorous antiamebic treatment was instituted with emetine, to which he responded. Five weeks after his operation, while under treatment, his abdominal wound became larger, inflamed looking and started to slough. Examination of material from the edge of the wound was positive for amebas, which promptly responded to applications of chiniofon solution and irrigations of chiniofon through the wound. He has practically recovered except for his neoplasm, which we will be obliged to remove surgically and it will entail a combined abdominoperineal resection."

During his stay in the hospital two x-ray examinations were made. The film of September 16 (fig. 1), before antiamebic treatment was instituted, shows a mass at A, strictured section at B (which probably was the site of occlusion), and general involvement of the descending colon above it, this also involving all of the sigmoid. The x-ray examination of November 8, after about ten days of antiamebic treatment, showed a reduction of the mass at the distal portion of the sigmoid and improvement of the strictured and intervening portion.

Dr. J. W. Foster reported that the patient was taking vioform when first seen, September 14, and took 1 grain (0.06 Gm.) of emetine for four days and 3 grains (0.2 Gm.) of carbarsone for eleven days, 2 grains (0.13 Gm.) for fourteen days and

Fig. 3.—Roentgen appearance, March 1936.

3 grains for ten days. November 25, emetine, 2 grains for two days and 1 grain for seven days, and 3 per cent solution of chiniofon was applied to the colostomy for sixteen days, three tablets daily for five days, a retention enema of 200 cc. of 2 per cent solution through the colostomy for two days and 100 cc. for three days. Stools were negative for amebas for some time (four straight specimens).

December 16 he again came under my observation. He stated that he had gained from the low point of 90 to 115 pounds (41 to 52 Kg.), the bowels moving about every thirty-

six hours, with fairly normal stools. Proctoscopic examination disclosed slight congestion of the upper part of the rectum and a thickened, granulomatous looking mass in the lower sigmoid (impassable). Roentgenograms showed a much more normal looking sigmoid than the former films, the descending colon was apparently normal, with no strictured sections (not seen in after-defecation films), and a possibility of a strictured state at A (fig. 1). Stools showed a few cysts. The patient was placed on 1 grain of emetine a day for ten days and chiniofon, full course, with vitamin B and diet regulations similar to types used in pernicious anemia.

At the next visit, Jan. 20, 1936, on proctoscopic examination, no lesion or pathologic condition was observed; the stools were negative for amebas and cysts, with cylindric stools; the patient felt perfectly well; roentgenograms showed a more normal sigmoid with still a suggestion of stricture at the distal portion, but judged by the large cylindric bowel movements each day and the normal caliber of this section in the after-defecation enema films, it was judged as of no significance. He weighed 129 pounds (58.5 Kg.).

When seen on February 6 he had not been taking antiamebic treatment for three weeks, and he felt well, still weighed 129 pounds and the stools and culture were negative. Examination of the blood revealed: red blood cells 4,270,000; hemoglobin 92 per cent; white blood cells 7,200, with the percentage of neutrophils 71, lymphocytes 20, mononuclears 6; eosinophils 1, basophils 2. Because of the history and the persistence of an ironed-out appearance and some irregularity in the rugae of the sigmoid, a course of 1 grain (0.06 Gm.) of emetine for ten days and a full course of chiniofon was reestablished. Roentgenograms, March 2, showed a marked improvement in the entire colon, definitely also in the sigmoid, with no appearance of the strictured state at the rectosigmoid junction, as noted on the clysmas and evacuation films. Rugae at that point were normal. The case, however, is resisting antiamebic treatments of all kinds and will require persistence with them from time to time. This is important, too, in connection with the eventual possibility of carcinoma. Films taken up to April 1936 show the strictured condition to be normal, but the transverse colon is still abnormal.

Cases of partial degrees of obstruction in amebic inflammation of the cecum and ascending colon are not uncommon, but occlusion distal to the middle of the transverse colon is most rare. In the case mentioned, the obstruction occurred in the sigmoid and was due to pathologic changes in the sigmoid walls. Most of the cases of partial obstruction are due to occlusion states in the right colon, healing leaving scar tissue, peritoneal adhesions, pressures of postcecal abscess or hepatic abscess of larger size pressing on the intestine. These with the other sequelae are noted in the chronic case. The time from the infestation to complete obstruction in this case was about twenty-two months, with three courses of antiamebic treatment in the meantime and the patient on vioform at the time of obstruction.

Complete intestinal obstruction due to enteric involvement above and localized in the sigmoid has not been disclosed in a search of the literature of the library of the New York Academy of Medicine. Several authorities have recorded instances of partial obstruction, notable among which are Sambuc,<sup>1</sup> Sellards,<sup>2</sup> Grall,<sup>3</sup> Dobell and Low,<sup>4</sup> Spangenberg,<sup>5</sup> Vergoz and

Hermenjat-Gerin,<sup>6</sup> Craig,<sup>7</sup> and Reed and Anderson.<sup>8</sup> Desjardins<sup>9</sup> calls attention to masses consisting of a true neoplasm of amebic origin or to an inflammatory mass secondary to an amebic ulcer or to an amebic ulcer alone being mistaken for carcinoma. He describes a patient with partial obstruction showing a hard, irregular mass with filiform narrowing, the clinical picture being that of cancer but due to inflammatory products of an ulcer plus spasm. Gunn and Howard<sup>10</sup> report three cases of amebic granulomas simulating cancer, the pathologic manifestations consisting of "isolated, chronic ulcer with progressive erosion of the wall of the bowel." They draw attention to the symptoms, physical signs and x-ray appearances being identical with carcinoma and the rarity of the condition. Rogers<sup>11</sup> refers to two cases of supposed carcinoma in which amebas were found and which were cleared up by emetine treatment. Reed and Anderson<sup>8</sup> mention having seen three cases in which definite tumor masses were found in the colon, but in none was the mass isolated (as it was in the case here reported). They draw attention to the significance of extension of the lesion to various parts of the colon as strongly against a diagnosis of cancer (such was the fact in this case). Gunn and Howard,<sup>10</sup> Hines,<sup>11</sup> and Reed and Anderson<sup>8</sup> draw attention to the coexistence of amebiasis and cancer, regarding which Reed and Anderson state that chronic amebiasis affords an excellent background for the development of cancer as a sequela and report four such cases. They draw attention to the importance of handling cases of amebiasis as a prevention of possible carcinoma, especially to lesions in the sigmoid and rectosigmoid regions. This is especially interesting in connection with the case reported, because, while the strictured state that caused the obstruction was in the upper portion of the sigmoid and entirely subsided under treatment, there was a granulomatous mass also in the rectosigmoid junction, which seems to have left an effect on the caliber of the intestine yet which granulomatous mass totally subsided and which is not interfering with normal bowel movements. Note should also be made that in the films taken after evacuation of the barium sulfate enema this is not noted, and normal mucosal rugae are present in this area, such not being possible of carcinoma existed.

As to the possible site of obstruction due to intra-enteric occlusion, Clark<sup>12</sup> reports the following: About 60 per cent possessed ulcers more or less through the colon, while 40 per cent had a local distribution in more dependent parts of the colon and appendix. In the order of incidence, they were placed as follows: The cecum and ascending colon, the rectum and sigmoid, and the appendix. Kartulis in Egyptian cases found the following distribution of the lesions approximately: the entire large intestine involved 50 per cent of the cases; ascending colon and sigmoid flexure only 25 per cent; cecum with either ascending or descending colon

or rectum 25 per cent. The appendix was involved only nine times in several hundred cases and the small intestine never.

In all instances of inflammation of the intestine, bacterial invasion of the wall exists. This is a secondary process irrespective and independent of the initial cause. This no doubt adds to the thickening of tissue, but when it is possible to control the initial cause (such as the destruction of pathologic amebas), the inflammation subsides. It is very probable that in obstructive conditions of the colon due to amebiasis the secondary infection is due to organisms of the typhoid-dysentery-coli group, together with low grade streptococci or staphylococci. Injection of the wall as noted at operation with the deposit of fibrin on the peritoneal surface indicates inflammation.

#### CONCLUSIONS

In a case of intestinal obstruction with fecal vomiting in which the occlusion was complete and occurring in the left side of the colon (sigmoid), the lesion was intra-enteric entirely and cleared up under antiamebic treatment.

784 Park Avenue.

### HYPOPHYSEOTHYROGENIC ADIPOSITY AND EMACIATION

JOHANNES WAHLBERG, M.D.

HELSINGFORS, FINLAND

In reporting, in the autumn of 1934, three cases of extreme emaciation of pituitary type in young girls, I<sup>1</sup> intended to draw attention to a form of morbid loss of weight heretofore but little considered and at the same time propose a method of treatment for it—medication with thyroid preparations. The syndrome is distinct, easily delimited and evidently not at all unusual. It comprises in the main—besides loss of weight—anorexia, constipation and amenorrhea, hypothermia, bradycardia, arterial hypotension and hypometabolism, as well as a tendency to hypoglycemia and prolongation of the dextrose tolerance curve. Von Bergmann,<sup>2</sup> who earlier in the same year published reports of a series of fifteen similar cases, adds to these an inclination to discomfort in the upper part of the abdomen and to an increase of the sedimentation rate of the red blood corpuscles. Two of my three cases showed definite phlebosclerosis, which disappeared entirely as the patient recovered; since then Rothmann<sup>3</sup> has recorded the same observation in one case. In all three cases the fingers were long and narrow, tapering "madonna" fingers, which may perhaps be interpreted as a tendency to acromicria. Hawkinson<sup>4</sup> has described a case with falling of the hair (pubic and axillary hair, eyebrows, eyelashes and hair on the head). The whole symptom complex is qualitatively exactly like Simmonds'<sup>5</sup> pituitary cachexia, but much milder, a Simmonds disease in miniature, reversible and without demonstrable anatomic lesion of the hypophysis.

Von Bergmann considers that there is in the first place an insufficiency of the anterior pituitary lobe, with associated disturbances in the ovaries, the thyroid

and the adrenals, often arising in connection with an overstraining of the endocrine system at puberty, pregnancy, labor and the menopause. The general asthenia with cor parvum, which is often observed in such cases and which was very prominent in all my cases, is considered by him to be a disposing factor. In accordance with this conception, von Bergmann has treated his patients with pituitary, mainly by injection or by means of transplantation, and has noted favorable results. Hawkinson and Rothmann have observed improvement during treatment with pituitary-like gonadotropic principle of pregnancy urine, and Kalk<sup>6</sup> describes a case in which the symptoms subsided during treatment with adrenal cortex extract.

#### PITUITARY ASTHENIA: PROBABLE PATHOGENESIS AND THERAPY

I<sup>1</sup> agree with von Bergmann's conception but at the same time emphasize the resemblance between the syndrome under discussion and hypothyroid conditions, with which, in all essentials, it seems to agree, except that myxedema is lacking. After one of my cases (case 2 in table) was considered by Josefson<sup>7</sup> as a psychogenic anorexia and was treated with thyroid substance, which resulted in a rapid return to complete health, I used the same treatment in my two other cases. The one improved distinctly, the other recovered completely with a weight increase of 11 Kg. in seven months and finally also a reestablishment of normal menses. The similarity to hypothyroidism and the effect of thyroid medication could be considered as indicating the decisive rôle played by the insufficiency of the thyrotropic function of the anterior pituitary in this primarily hypophyseogenic syndrome. The supply of thyroid substance would break a vicious circle by giving the adenohypophysis a chance to recover and take up again its exhausted function. Analogously, the effects of other organ preparations could be understood, such as those previously mentioned of estrogenic substance, adrenal cortex, and pituitary-like gonadotropic principle of pregnancy urine. If this theory is correct, it explains the mention in the literature on this subject of certain cases reacting better to one and others to another of the endocrine principles mentioned; the choice of preparation should depend on which of the partial functions of the anterior pituitary is most affected.

As a contrast to my cases, in which hypothyroidism and emaciation were dominating symptoms and, seemingly, a tendency to acromicria was present, I called attention to cases of thyrotoxicosis presenting a tendency to adiposity and acromegaloïd symptoms. In the former case hypophyseogenic emaciation is quite apparent; in the latter there is perhaps a distinct hypophyseogenic thyrotoxicosis, each in the main conditioned by change in the "incretion" of the thyrotropic hormone from the adenohypophysis, with deficiency in the former, and hypersecretion in the latter case. This theory seemed to be supported by the fact that two of my cases at first apparently reacted to thyroid medication with slight symptoms resembling thyrotoxicosis, before the favorable effect clearly showed.

#### REPORT OF CASE

During the progress of this work I had under observation a case which behaved in every respect quite the opposite to the condition described: a young girl in

whom thyrotoxicosis and a tendency to adiposity seemed to develop simultaneously, while apparently a thickening of the finger tips had occurred at the same time. Since then the correctness of this line of thought seems to be confirmed by the development in the patient of pituitary asthenia leading to a loss of 29 Kg., which rapidly improved during thyroid medication, with an increase of 9 Kg. in one month.

A girl, aged 18 years, who had been treated with iodine for a slight goiter, showed in the spring of 1933 fatigue, tremor, sweating and tachycardia simultaneously with increase of weight. A certain puffiness round the eyes had been noticed and the finger tips seemed to have become broader than before. When examined objectively in October 1933 she showed a thyroid gland of ordinary size with a lump as large as a bean in the lower pole of the right lobe, moderate tremor, a heart rate of 120 per minute and a blood pressure of 160-140 systolic, 90 diastolic. Her weight was 80 Kg. net and her height 166 cm. The basal metabolism (Krogh) was +11 per cent calculated according to her real weight and +24 per cent according to her calculated normal weight, which was 63 Kg. She was treated in a purely conservative way with rest, diet and light sedatives. During this treatment her condition gradually improved; at home her pulse was often only about 70 per minute, but it would still rise, when examined by the physician, to 120 per minute, and the weight continually increased, attaining its maximum, 86 Kg., in December 1933.

\* Cases 1, 2 and 3 are those previously reported by the author; case 4 is the one here described, 4a being the stage of thyrotoxicosis and adiposity at its height in the autumn of 1933 and 4b the stage of pituitary asthenia at its height in the autumn of 1935. The normal weight is calculated from tables made on the basis of the material obtained from the life insurance companies in Finland.

From the beginning of 1934 the symptoms of thyrotoxicosis declined and simultaneously the weight decreased. In January the basal metabolism was +5 per cent. Calculated according to the normal weight it was +19 per cent. She had lost 1 Kg. In March she was free from symptoms, except for a labile pulse and a certain tendency to sweating; the weight had fallen to 81 Kg. The patient began to complain of increasing gastric dyspepsia, which became worse, in spite of the expulsion of an intestinal worm (*Diphyllobothrium*) and the prescription of a diet. In May 1934 excessive dysmenorrhea occurred. The basal metabolism was then +5 (+15) per cent and the weight 80 Kg. During the summer the last symptoms of thyrotoxicosis disappeared, but the dyspepsia became worse and was accompanied with growing loss of appetite and constipation. The weight continually went down and when, in January 1935, it had fallen to 65 Kg., a high caloric diet and rest were tried. In February the basal metabolism was  $\mp$  0 per cent and the weight 64 Kg. In June amenorrhea occurred too and the loss of appetite as well as the constipation became extreme. During July and the beginning of August the patient was in a sanatorium for a slight polyarthrititis, and there it was noted that her pulse was often only about 50 per minute and the axillary temperature was below 36 C. (96.8 F.). In contrast to the previous year, she was always cold. An attempt with estrogenic therapy by mouth had no effect. At the end of August 1935 the basal metabolism was -25 per cent, the rest pulse 58 per minute, the temperature 36.1 C. (96.9 F.), the blood pressure 100 systolic and 70 diastolic, and the net

weight had reached a minimum of 57 Kg. Roentgen examination now, as during the period of adiposity and thyrotoxicosis, showed a sella turcica of usual appearance.

Pituitary asthenia, which already in the spring of 1935 was thought possible, was now considered certain, and thyroid medication was started during clinical observation. The first week the patient took thyroid tablets (Burroughs-Wellcome) 0.1 Gm. and then 0.2 Gm. daily. In ten days all symptoms had improved considerably and the weight had increased by 1 Kg. After one month's treatment with the same daily dose of thyroid the symptoms disappeared completely: the appetite was good, there was no constipation and the menses were normal, the feeling of chilliness had gone, the pulse frequency was 75 per minute, the blood pressure was 130 systolic and 90 diastolic, and the weight was 66 Kg., an increase of 9 Kg. in one month. Only a slight palpitation in the evenings was noticed in the beginning of the thyroid treatment. Slight symptoms in the joints and a chronic tonsillitis were still present, and since the beginning of the polyarthrititis the sedimentation rate of the red corpuscles was slightly increased. The thyroid dose was cut down to half, and after a total duration of six weeks the medication was stopped. The weight of the patient was then 67 Kg. and, the joint symptoms excepted, she presented a picture of perfect health. The broad, seemingly acromegaloïd, finger tips have not altered.

#### COMMENT

It seems as if this case could with some reason be considered to support the theory here put forward of pituitary asthenia, its pathogenesis, symptomatology and therapy. Two completely contrasting syndromes are here found in succession in the same person: first thyrotoxicosis accompanied by pathologic fatness and then symptoms of hypothyroidism accompanied by pathologic emaciation. An analogy may be found in the well known fact that a thyrotoxicosis, by excessive hyperactivity, may lead to a functional exhaustion of the thyroid gland and to myxedema. Everything points to this in my case, being in the first place a question of disturbance in the endocrine activity of the anterior pituitary, first excessive and then defective function. In both stages the disturbance in the thyrotropic part of its function appears to be dominant. Next comes the disturbance in the fat metabolism. It seems as if this in a peculiar way compensates for the disturbance in the basal metabolism, so that an increased basal metabolism is accompanied by adiposity, and a lowered basal metabolism by emaciation. The fact that these contrasting changes in the function of the anterior pituitary are followed by complete balance in its endocrine activity with clinical health seems to show that a grave anatomic lesion in the adenohypophysis cannot here, as in pituitary cachexia (Simmonds), be the cause of the functional disturbance in this organ. The clinical appearance of the thyroid gland and the roentgenologic aspect of the base of the skull also remain normal, while the clinical picture varies in this remarkable way.

As regards therapy with thyroid substance in pituitary asthenia, in the case reported here during one month of this treatment with quite small doses a continued loss of weight, as much as 29 Kg. in about a year and a half, and associated alarming symptoms were arrested and followed by a weight increase of 9 Kg. and restored health.

#### SUMMARY

1. The case reported presents two syndromes: first adiposity and then emaciation. The main symptoms of the syndrome discussed are severe loss of weight and of appetite, constipation, amenorrhea, hypothermia, bradycardia, arterial hypotonia, hypometabolism, and disturbances of the sugar metabolism. Less constant

symptoms are epigastric discomfort and increased sedimentation rate of the red blood corpuscles (von Bergmann), falling of hair (Hawkinson), reversible phlebosclerosis, and an apparent tendency to acromicria (Vahlberg). The syndrome is qualitatively almost exactly like Simmonds' pituitary cachexia but is in every detail slighter and reversible, and there are no signs of an organic lesion of the hypophysis.

2. The theory put forward earlier, that the syndrome may be conditioned by a functional deficiency of the anterior pituitary, is supported and at the same time it is pointed out that it seems as if the thyrotropic part of the adenohypophysis function plays an important part in the pathogenesis. In support of this theory it is stated that the syndrome resembles hypothyroidism in detail, except for the absence of myxedema, and that, at least in certain cases, medication with thyroid preparations has an extraordinary effect: three of my four patients recovered rapidly and completely during thyroid medication.

3. The case here presented first showed a thyrotoxicosis accompanied with adiposity, and then changed directly to the type of emaciation discussed with prompt recovery during thyroid medication. These two clinical pictures are presented as complete contrasts: probably hypophyseogenic thyrotoxicosis with adiposity and hypophyseogenic hypothyroidism with loss of weight. Very likely the first is due to hyperfunction, the latter to insufficiency of the anterior pituitary and chiefly of the thyrotropic part of its endocrine function.

## EFFECT OF ALCOHOL ON DIGESTION BY GASTRIC JUICE, TRYPSIN AND PANCREATIN

HARRY BLOTNER, M.D.  
BOSTON

In a previous study<sup>1</sup> it was found that gastric juice, trypsin and pancreatin digested insulin and that the digestion of insulin was prevented when alcohol of proper concentration and amount was added to this drug or to these enzymes. Apparently this effect was produced by the destruction of these enzymes with alcohol. It seemed that this knowledge might be of significance in interpreting the etiology of the polyneuritis or deficiency disease so often encountered in chronic alcoholic patients. Shattuck<sup>2</sup> suggested that alcoholic polyneuritis was caused chiefly by the failure to take or assimilate food containing a sufficient quantity of vitamin B. Such a view was held by Meyer,<sup>3</sup> Wechsler,<sup>4</sup> and Jolliffe and Joffe.<sup>5</sup> Similar ideas were expressed by Spies and DeWolf,<sup>6</sup> who felt that the development of pellagra in chronic alcoholism was due to loss of appetite and the substitution of drink

for food, and by Strauss,<sup>7</sup> who concluded that alcoholic polyneuritis was probably the result of dietary deficiency, possibly conditioned by disturbed gastro-intestinal function.

Since it has been suggested that there was a deficient assimilation of food or a disturbed gastro-intestinal function in alcoholic polyneuritis it appeared of value to study this problem by determining the effect of alcohol on digestion by gastric juice, trypsin and pancreatin. This paper presents some observations on this subject.

### PROCEDURE

The method of investigation was as follows: Specimens of gastric juice were obtained from a variety of nonalcoholic patients and the amount of free hydrochloric acid was determined. Each specimen was divided into two equal parts of about 10 cc. Pieces of egg albumin, which were coagulated by heating, were added to one part of gastric juice to serve as a control test. Then 10 cc. of 48 per cent alcohol and egg albumin were added to the second part. These were incubated at 37 C. and the amount of digestion was noted in six, twenty-four and forty-eight hours.

Similar tests were made with commercial powdered trypsin and pancreatin. About 0.5 Gm. of these substances was mixed with 20 cc. of water and divided into equal portions. Then pieces of egg albumin and alcohol were added as in the experiments with gastric juice and the results were noted.

### RESULTS

The results obtained in these experiments were very interesting. In the control tests with the different specimens of gastric juice there was a varying amount of digestion of the egg albumin at the end of six, twenty-four and forty-eight hours and it increased as time went on. The digestion was most marked in those specimens of gastric juice in which the free hydrochloric acid was as high as 80 and least when the free hydrochloric acid was 0. However, in the tests with alcohol the results were quite different. Here there was practically no digestion of the egg albumin even at the end of forty-eight hours. The tests were repeated by incubating alcohol and gastric juice for fifteen minutes. The alcohol in this mixture was evaporated off in vacuo at 37 C. Then egg albumin was added to the remaining gastric juice and the amount of digestion was noted. In these tests also there was no digestion of the albumin. The results suggested that alcohol destroyed the enzymes in the gastric juice.

In the experiments with trypsin the results were more striking than those obtained with gastric juice. After the egg albumin was added to the trypsin mixture there was usually marked digestion within six hours and practically complete digestion in twenty-four hours. In contrast, when alcohol was added to the trypsin there was almost no digestion even at the end of forty-eight hours.

The results with pancreatin were similar to those obtained with trypsin, although pancreatin did not produce as much digestion as trypsin. However, when alcohol was added to the pancreatin there was no digestion of albumin during the period of observation.

### PROTEOLYTIC ACTION OF GASTRIC JUICE OF ALCOHOLIC PATIENTS

As a result of the previous experiments, it was reasonable to conclude that alcohol inhibited the proteolytic activity of certain digestive enzymes in vitro. It

then appeared of interest to determine whether or not this was true in alcoholic patients. To study this phase of the problem, a group of eight alcoholic individuals<sup>8</sup> who drank about 1 or 2 pints of whisky a day for a period of about ten days was selected. Specimens of gastric juice were aspirated two or three days after the patients were over their alcoholic bout and the proteolytic effect was determined. There was no free hydrochloric acid present in any of the samples of gastric juice.

The results obtained were of considerable interest. In these cases digestion did not take place as it did with the gastric juice of the nonalcoholic patients. Instead, no digestion occurred. It appeared that the proteolytic activity of gastric juice was inhibited.

Since the gastric juice from these alcoholic patients was found to be devoid of free hydrochloric acid, it seemed well to investigate its significance in relation to digestion. To determine this, hydrochloric acid was added to specimens of gastric juice aspirated from two of these individuals to make the free hydrochloric acid 40 and finally gastric juice with a free hydrochloric acid of 35 was obtained from an individual who drank a considerable amount of liquor for two or three days. Egg albumin was added to these specimens and incubated. The amount of digestion was noted for a period of forty-eight hours. In these experiments, too, no digestion was noted during the test period. Apparently, the absence of free hydrochloric acid in itself was not an important factor in inhibiting the proteolytic action of the gastric juice obtained from these alcoholic patients.

#### COMMENT

It is apparent from the results obtained in these experiments that a sufficient amount of alcohol inhibits the proteolytic activity of certain gastro-intestinal enzymes. In considering the chronic alcoholic patient with polyneuritis or deficiency disease, it would appear that the large quantities of liquor taken over a long period of time destroys digestive enzymes and thus prevents the proper digestion and assimilation of food. Consequently, a deficiency disease is produced. This idea fits in with the views already expressed by various authors. However, this study, perhaps, gives more direct evidence in this matter.

#### CONCLUSION

A proper amount of alcohol destroys the proteolytic activity of certain gastro-intestinal enzymes in vitro and in vivo.

It is suggested that alcoholic polyneuritis or deficiency disease may be caused, in part at least, by faulty digestion and assimilation of food resulting from the destruction of digestive enzymes by large quantities of alcohol taken over a considerable period of time.

## ELECTRO-URETHROTOMY IN THE TREATMENT OF URETHRAL STRICTURES

LEANDER WILLIAM RIBA, M.D.

CHICAGO

Present day teaching regarding the proper management of urethral strictures may be summed up in a few words: Dilate the stricture whenever it is possible to do so; otherwise cut it. Between these two extremes the average physician has chosen a rather benign course of therapy, which will give to his stricture patient the greatest benefit and best result. For routine dilation, hard rubber bougies and steel sounds have given relief to many patients for a good many years. For urethrotomies, the Maisonneuve knife and the Otis instruments are only too well known to most urologists.

The fact that there has been no radical change in instruments and technic during the past twenty-five years or more speaks well for present day therapy, which in the majority of instances has given satisfactory results. Because of conservatism, however, one wonders whether or not urologists are apt to crowd into the dilation group strictured urethras which perhaps primarily should be treated surgically. I am sure there is a small group of patients who submit to dilation treatment only out of sheer necessity in order to obtain relief from their severe, distressing symptoms. Again, urologists hesitate to advise surgery or to operate on some of these obstinate strictures because from experience they have learned that adequate satisfactory results are not always obtained. The importance of urethral strictures is seriously brought to our attention when we are dealing with such complications as superficial urinary extravasation. In large hospitals, where many of these patients are seen and cared for, the surgical mortality is still reported to be approximately 50 per cent.

It is still recognized that there are certain types of strictures which should in most instances be treated surgically. Among these may be mentioned (1) traumatic or fibrotic strictures, (2) congenital strictures, (3) resilient strictures, (4) strictures of the penoscrotal angle and (5) strictures in patients who develop chills and fever following instrumentation. There is another small group of patients who do not always fit well into the scheme of progressive dilation and are at times better managed surgically. Occasionally an individual is seen who does not have time to undergo a long course of urethral dilation. Elderly patients with poor health may not tolerate well the shock of repeated sounding. Many Negro patients abhor the sight of a sound and will not submit to regular dilation treatments. Occasionally fibrotic strictures develop in the anterior urethra following transurethral operations, and the dilation management of these strictures may be very troublesome. In the female, undilatable strictures are encountered which may lend themselves very readily to surgical intervention.

For some reason or other, it is not always possible to treat these patients surgically. Hospitalization for a

Read before the Chicago Urological Society, Jan. 23, 1936.

This instrument is manufactured by I. Greenwald, Inc., Gary, Ind. From the Department of Urology, Northwestern University Medical School, and Passavant Memorial Hospital.

The author is indebted to Drs. Sanner, Christensen and Hibbs of the Urological Department, Northwestern Medical School, for their help and cooperation in this work.

**Candy and the Child's Diet.**—In general, the proper place of sugar in the food supplies and eating habits of children is not in such concentrated forms as candy, nor in the indiscriminate and excessive sweetening of all kinds of food, but rather as a pre-servative and mild flavor to facilitate the introduction into the child's dietary of liberal amounts of fruit and milk. For many reasons it is desirable that the dietary contain about a quart of milk per day, at least as long as growth continues. —Sherman, H. C., Food and Health, New York, Macmillan Company, 1934.

few days to a few weeks or more becomes necessary. On the other hand, when a patient is hospitalized and operated on with the Maisonneuve or Otis instrument, complications such as hemorrhage and sepsis are not uncommon and even death may occur. While urethrotomy is a rather simple operation, its present disfavor may be the result of too many complications and poor results. Admitting that surgical strictures still exist, any operation which will lower the present

Method of inserting electro urethrotome.

morbidity and mortality and give better results should become the procedure of choice.

During the past three years at the Northwestern University Urological Clinic we have resorted to a new method of treating urethral strictures. I am not aware that this method has been reported previously. Livermore<sup>1</sup> in 1930 suggested the use of a fulgurating current for the softening of urethral strictures through a urethroscope. Sarmiento<sup>2</sup> of Mexico City recently reported cases of urethral strictures treated with bipolar-diathermy coagulation. Although he reports 95 per cent good results, it would seem difficult to control the depth of the coagulation in all cases in which this type of current is used.

With the recent popularity of the cutting current, it occurred to me that this type of current might be utilized in the cutting of urethral strictures. The preliminary report of this work has already appeared.<sup>3</sup> A sufficient number of patients have been operated on and followed to allow further comment on this work. As will be noted, we have treated some small caliber strictures by urethrotomy which might have been dilated with sounds just as easily. In order to evaluate this procedure rapidly and compare notes with the usual dilation treatments, all tight strictures were first sectioned and subsequently dilated.

For the division of urethral strictures we have developed a No. 12 F., semiflexible, insulated electro-urethrotome equipped with an expansible cutting loop. I have elected to call this operation an electro-urethrotomy. A standard filiform bougie should be attached to act as a guide. After the urethrotome has been inserted, the loop may be expanded to the desired caliber just proximal to the deepest stricture, as shown in the diagram. Contact is then made with a foot-switch and the instrument withdrawn. The current

may be discontinued any time during the withdrawal. All cutting is done at 12 o'clock along the surgical urethral roof and distal to the cut-off muscle. There is no shock and very little active bleeding. One per cent cocaine urethral anesthesia has been used as a routine in all but one case. Patients who have urine in the bladder are able to void immediately after the urethrotomy. An indwelling catheter is unnecessary. In a tight, deep stricture of the bulb, difficulty may be encountered in passing the urethrotome. Should this happen, the stricture may first be dilated with a small sound or bougie, and cut later. Traction on the urethra with pressure on the suspensory ligament may straighten the canal sufficiently to allow the instrument to pass.

A summary of the first fifty stricture patients on whom an electro-urethrotomy was performed is presented here. Forty-three of the patients were operated on in the dispensary, six in the Passavant Memorial Hospital, and in one case surgery was precluded because of high grade morphine addiction. The patient was taking between 5 and 8 grains (0.3-0.5 Gm) daily, and we felt that this was a contraindication to this or any other operation.

These strictures were classified as in table 1. The majority of the single strictures were located in the bulb. All patients but eight gave a history of a previous urethral infection. Twenty-one, or 42 per cent, had a history of stricture treatments. Eight, or 16 per cent, gave a history of one or more stricture operations.

The associated pathologic condition was in forty-eight instances a coexisting prostatovesiculitis of various grades. In fifteen patients out of forty, 38 per

6 per cent, had a positive Wassermann reaction. This percentage seems low and is quite at variance with the publication of Ross<sup>4</sup> in 1927. In a series of fifty cases of stricture, he found a positive Wassermann reaction in thirty-three, or 66 per cent. Two patients had gonorrhea. One of these had increasing difficulty in urinating after a six months protracted gonorrheal urethritis. A urethrotomy, followed by a few urethral sounds, cleared up the difficulty in urinating and the

urethral infection. The other patient was treated by urethrotomy and three weeks later developed a urethral discharge that contained gonococci. We have listed this case as an acute exacerbation, although a reinfection was a possibility. Marked renal insufficiency was noted in two cases. Bilateral epididymitis, solitary ulcer of the bladder, double kidney and ureter, carcinoma of the bladder, generalized carcinomatosis and advanced pulmonary tuberculosis were noted once each.

It has been interesting to compare the immediate results of cases in which electro-urethrotomy was done with those treated by progressive dilation. From the records of the Northwestern University Clinic it was noted that it took an average of twelve treatments over a period of three and one-half months to perform dilation in forty-five cases from 15.31 F. to 25.91 F. In the present series we have been able to increase the average caliber in forty-nine cases from 10.8 F. to 23.5 F. with approximately one section treatment (two patients were reoperated on because the deepest stricture was missed the first time). Also from the records of the clinic, in 164 cases in which the diagnosis of urethral stricture was definitely recorded, forty-one patients, or 25 per cent, failed to return for treatments; ninety-seven, or 60 per cent, noted satisfactory improvement from their treatments, while twenty-two, or 13.5 per cent, stated that they were unimproved. Two patients stated that they were made worse and in two other cases the results were not clear.

In the present series of forty-nine cases in which operation was performed, forty-six, or 94 per cent, of the patients returned for at least one follow-up treatment. Of the three patients who did not return, follow-up reports were obtained for two. One clinic

patient informed the social worker after six months had elapsed that he was entirely well. This was the patient who had bilateral epididymitis and a marked pyuria. I demonstrated the case to the students as probable genito-urinary tuberculosis. Calibration was not done before cystoscopy and the stricture was discovered while an attempt was being made to introduce the cystoscope. The other patient was from out of town and he went elsewhere for his follow-up examination one month after the urethrotomy. This patient is one of the two listed in the unimproved column. Cystoscopy elsewhere revealed an inoperable carcinoma of the bladder. The other patient who was unimproved was later operated on with an excellent final result. The result in one patient who did not return is unknown.

The operative and postoperative complications have not been troublesome. Eight patients had some immediate postoperative bleeding, while three had mild secondary hemorrhages on the first, third and sixth days. None of these hemorrhages were severe. In two cases the loss of blood amounted to above 2 ounces (60 cc.) each. In two cases considerable hemorrhage was produced by the passage of the instrument. Postoperative frequency and burning lasting from a few hours to seven days were noted by thirteen patients. Two patients had partial temporary urinary incontinence, in one noticeable for four days and in the other for ten days. One patient developed a mild epididymitis, while another developed an acute prostatovesiculitis after three weeks, at which time the smear was positive for gonococci. A paraphimosis was seen once on the fourth postoperative day; it was easily reduced. In four of the earlier cases some mechanical difficulties were experienced, such as the breaking or collapsing of loops.

It is noted that, of forty-nine patients who were operated on, only thirty returned for follow-up sounds.

TABLE 6—Six Months' Results in Thirty Cases (Electro-Urethrotomy)

Average caliber before treatment	10.8 F.
Average caliber after six months	26.5 F.
Average number of urethrotomies	1.04
Average number of postoperative dilations	4.2

At the end of six months the average caliber in these thirty cases was 26.5 F. The average number of postoperative sounds per patient was 4.2. Comparing these results with the average results of dilation, it was found that the number of treatments necessary to open a tightly strictured urethra had been reduced by 66 per cent. Only one of the earlier patients who was operated on has returned within the last year with a recurrence. I am sure there must be others who perhaps have gone

elsewhere Twenty-six patients were recently asked to return for observation, but to date (January 1936) only four have come in In these four cases the urethras were wide open after one, one and one-half, two and two and one-half years All patients who are coming in for infrequent follow-up sounds have shown no unusual tendency to recontract

#### REPORT OF CASES

A few case reports are submitted illustrating the type of strictures in which electro-urethrotomy has given excellent results:

CASE 1—L T, a Negress, aged 55 years, came to the clinic for the first time Oct 25, 1927, complaining of pain and difficulty on urination She did not return for treatments and for seven years had irregular dilations elsewhere Sept 16, 1935, she returned to the clinic with the same complaints plus dribbling, frequency and nocturia The Wassermann reaction was negative but the Kahn test was three plus positive A filiform stricture in the distal urethra, a papilloma of the external meatus and pus in the urine were found on examination A few days later a 12 F sound was passed with slight difficulty October 3 an electro-urethrotomy was performed under 1 per cent cocaine anesthesia The stricture was cut to a 25 F Ten days later she returned with marked improvement of her symptoms Cystoscopy was performed October 23 and a 24 F cystoscope was easily passed A cystic urethritis was noted, which was lightly fulgurated Six weeks after the urethrotomy a Kollmann dilation to 30 F was easily carried out Dec 9, 1935, she stated that there were no bladder symptoms, nocturia, difficulty or frequency There was no residual urine Sections of the tumor removed from the meatus the day on which cystoscopy was done showed a benign papilloma This is a case of undilatable fibrotic stricture in the female which reacted well to surgical division

CASE 2—W R, a man, aged 54, came to the clinic June 13, 1935, because of an acute conjunctivitis The Wassermann reaction was four plus positive He was treated in the Department of Dermatology and referred to the Department of Urology September 19 because albumin and pus had been noted in the urine He stated that he had no urinary symptoms Examination, however, revealed a pyuria, chronic prostatovesiculitis (grade 2) and a filiform stricture of the bulb A 10 F Le Fort sound was passed September 23 On arriving home he had a severe chill and was in bed for one week He was removed to a hospital on account of sepsis, where he remained for sixteen days more October 24 he returned to the clinic His condition was about the same as on the previous examination The urine was dirty and ammoniacal The stricture was now size 13 F An electro-urethrotomy was performed and the stricture was divided to 27 F He returned in one week stating that he was definitely improved November 14 a 24 F diagnostic bougie was passed into the bladder without difficulty A No 25 Van Buren sound was passed easily, December 20 Jan 10, 1936, a 26 F Benique was easily passed into the bladder Residual urine of 2 ounces (60 cc) was present A vesical neck obstruction is probable, and cystoscopy will be done The patient is very happy over the result

CASE 3—J H, a man, aged 54, entered the clinic Feb 25, 1935, complaining of difficulty in urinating, fever and swelling of the scrotum He had been operated on for strictures in 1900 and 1932 Examination revealed a typical superficial urinary extravasation with sugar and acetone in the urine The Wassermann reaction was negative He was operated on the same day, and an internal and external urethrotomy was performed with a Maisonneuve knife A large, deep perineal abscess also was found The anterior strictures were cut to a 26 F He returned to the clinic March 26 and a 12 F Le Fort sound was passed with slight difficulty He was subjected to weekly dilations and on June 18 the urethra was open to a 21 F Sounds were passed with some difficulty and the perineal fistula was intermittently open He was not seen again until November 4 At this time he stated that there had been a recent recurrent swelling in the perineum, which had ruptured Examination revealed an indurated scrotal and

perineal fistula The urethra was tightly strictured An electro-urethrotomy was performed November 7 and the strictures were divided to a 27.5 F He returned six days later and the fistula had closed Three weeks after the electro-urethrotomy a No 25 Van Buren sound was easily passed and the fistula was still closed December 4 he stated that he felt better and urinated with less discomfort than he had for many years

CASE 4—E C, a Negro, aged 62, was referred to the clinic by Dr Robert Graham, Nov 2, 1934, because of rapid recontraction of the urethral strictures following sounds He had been troubled with strictures for twenty years On examination multiple small caliber strictures, a prostatovesiculitis and pus in the urine were noted The Wassermann reaction was negative An electro-urethrotomy was performed December 6, and the strictures were divided to a 27 F Jan 25, 1935, roughness was noted in the bulb with a 20 F diagnostic bougie The deep stricture only was recut to a 28 F April 2, 1935, the urethra was open to a 24 F sound Dilation was repeated at irregular intervals and on October 17 the urethra was open to a 31 F sound This was a resilient stricture, which yielded readily to electrosurgical division The deepest stricture was not cut well the first time and was adequately redivided the second time The patient is quite happy about the final result

CASE 5—W W, a man, aged 40, seen in the Passavant Memorial Hospital Oct 5, 1934, complained of chills and fever, difficulty in urinating, backache, and swelling of the knees and ankles He was treated for urethral strictures two years before Examination disclosed a pyuria, a prostatovesiculitis, multiple arthritis, and multiple strictures of the anterior urethra (bulb 12 F) A flat film was negative for stones The Wassermann reaction was negative The following day the strictures were divided with the electro-urethrotome to 25 F He left the hospital greatly improved on October 13 November 3, a 22 F diagnostic bougie passed easily The following week a No 23 F Van Buren sound was passed snugly The urine now was clear and he had no symptoms The patient did not return to the office until May 24, 1935, at which time he presented signs of an acute anterior gonorrheal urethritis He was somewhat chagrined about the diagnosis and did not return for treatments This was an unfavorable dilation case which reacted well to urethrotomy

CASE 6—S A, a Negro, aged 65, had been coming to the urologic clinic for five years because of frequency, nocturia and some difficulty in urinating Repeated cystoscopic examinations revealed a contracture of the bladder neck with from 2 to 4 ounces (60-120 cc) of clear residual urine He was referred elsewhere for resection of the prostate and was operated on Dec 26, 1934 Oct 8, 1935, he returned complaining of recurring difficulty on urination Calibration revealed eight distinct fibrotic strictures of the anterior urethra, size 16 F An electro-urethrotomy was performed November 14 and the entire urethra divided to 27.5 F Four weeks later a No 24 F Van Buren sound was easily passed, December 13 a 25 F and December 27 a 26 F Van Buren sound passed easily These multiple fibrotic strictures following prostatic resection were very easily managed by an electro-urethrotomy and sounds

CASE 7—H G, a man, aged 26, was referred to the office in August 1934 with a history of an undilatable stricture of four years' duration In a motorcycle accident in 1929 he sustained some injury to the penis In 1930 a physician inserted a sound carrying two copper electrodes into the urethra The current was switched on for five minutes, during which time he experienced severe pain During the next four years he had many urethral dilations, and examination revealed a 2 inch fibrotic stricture of the penile urethra, size 14 F Because of the history, an electro-urethrotomy was recommended and performed Aug 19, 1934 Two attempts to cut the stricture were unsuccessful He returned December 31 and another urethrotomy was tried Again the loop failed to cut He returned again March 17, 1935, stating that, while he believed in this operation, nevertheless he was afraid of it He confessed that during the previous operations as soon as he felt the current he raised his buttocks off the body electrode and so disconnected the current Another urethrotomy was performed at this time, with the plate placed over the abdomen

secured with an abdominal binder. At this sitting the strictures were easily divided to 31 F. May 6, 1935, a No. 23 F. Van Buren sound passed without difficulty. In a recent communication he stated that he was being kept open to 26 F. and was symptom free. This is a case of an undilatable stricture which yielded to an electro-urethrotomy when adequately performed. The first two operations failed because the patient feared the use of electrical instruments in the urethra and deliberately chose to break the current during the operation.

CASE 8.—R. H., a medical student, aged 32, had sustained a straddle injury at the age of 8 years. During the following twelve years he had many sounds passed and three stricture operations. The perineal fistula persisted. In 1921 he was operated on by Dr. Dean Lewis with an excellent result. He was seen in the Passavant Hospital in February 1933 because of a pyuria following an influenzal infection. The urine was dirty and contained many shreds. He was again seen in the office April 10, 1933, at which time calibration of the urethra revealed a long fibrotic stricture in the bulb (13 F.). A prostatovesiculitis (grade 2) was present. The seminal fluid also contained *Trichomonas* in large numbers. He preferred an electro-urethrotomy to the usual sound treatments. April 22, 1933, in the clinic, the urethra was cut to 26 F. On the sixth postoperative day he had a slight secondary hemorrhage with some frequency of urination. One month later a 23 F. diagnostic bougie was easily passed into the bladder. June 2 a 24 F. and September 19 a 25 F. bougie were passed. He has reported for irregular urethral dilations at three or four month intervals and a No. 29 F. Van Buren sound can now be passed without difficulty. Because the patient had such brutal sound treatment when he was a boy, he felt that an electro-urethrotomy was the procedure of choice in his case.

#### COMMENT

This electro-urethrotome is not presented as a panacea for all urethral strictures. It has been found very useful in the fibrotic, resilient and undilatable types. The operation is not recommended to displace the use of urethral sounds or bougies. In large caliber strictures and urethral infiltrations, it undoubtedly has little value. In patients, however, who fall in the groups named, an electro-urethrotomy may fill a needed niche, particularly from the standpoint of the patient. For an individual who has a strictured urethra and who for some reason or other (renal colic, hematuria or injuries) needs an immediate cystoscopy, this method would seem more rational than the usual avulsion of the stricture, which is so frequently resorted to.

In our hands, this operative technic has seemed so much simpler than that of other urethrotomies now in general use that I feel it may replace some of them to a certain extent. I do not maintain that this instrument and the technic employed are necessarily entirely correct, but I do believe that the principle of using the cutting current marks a step of progress in the management of undilatable and surgical strictures. Even though the majority of these patients were operated on in the clinic, I do not choose to recommend this operation as an office procedure. I feel that in most instances this operation has a lower morbidity and mortality and necessitates fewer hospital days. Post-operative sounds should be passed as a routine procedure, preferably after three or four weeks. We have calibrated most patients after three weeks and passed a Van Buren sound on the fourth week. With a few exceptions, these sounds were very readily passed. There was no indication that more scar tissue was apt to form following this operation. In reality, there must be considerable absorption. In nearly every case in which the operation was properly performed, it has been possible to convert a small caliber stricture into

one of large caliber with one electrosection treatment. We have not hesitated to repeat this operation a second time. Because we were dealing primarily with ambulatory patients we have elected to keep the caliber of the cut closer to a 25 F. than to a 30 F. No patient objected to the treatment and all were satisfied with the results obtained. We have no definite check on postoperative temperatures, though I am certain that some patients must have had fever reaction.

## EFFECT OF CAROTENE AND VITAMIN A ON PATIENTS WITH DIA- BETES MELLITUS

### III. THE EFFECT OF THE DAILY ADMINISTRATION OF CAROTENE ON THE BLOOD CAROTENE OF NORMAL AND DIABETIC INDIVIDUALS

ELAINE P. RALLI, M.D.  
ARTHUR C. PARIENTE, M.D.  
HAROLD BRANDALEONE, M.D.  
AND  
SIDNEY DAVIDSON, M.D.  
NEW YORK

In a previous study we<sup>1</sup> reported the effect of single doses of carotene on the blood carotene of normal and diabetic persons to whom it had been orally administered. In those cases the blood carotene was followed daily for one week after the administration of carotene. In the present study we have observed the effect of the continued administration of carotene on the blood carotene and cholesterol of a group of four normal and four diabetic persons.

#### PROCEDURE

Following a preliminary period on a constant diet, during which the blood carotene and cholesterol were determined, three of the normal subjects and three of the diabetic patients were given orally 1 cc. of 0.3 per cent carotene in oil daily for a period of from two to four months (cases 13, 14, 15, 16, 17 and 18). The diets in this group of normal subjects were not identical to the diets of the diabetic patients but included vegetables twice a day with the exception of carrots. None in this group were hospitalized and, as it was difficult for them to come to the laboratory before breakfast, blood was withdrawn four hours after breakfast. The carotene was given with the evening meal, so that the blood carotene estimations were done approximately seventeen hours after the administration of carotene. Determinations were made at intervals of from one to two weeks.

The observations in case 19, normal, and case 20, diabetic, were done while the individuals were in the hospital. Their diets were in every way identical. The carotene was determined on fasting samples of blood. After the control period, two doses of 25 cc. of 0.3 per cent carotene were given at intervals of one week.

From the Third (New York University) Medical Division, Bellevue Hospital, and the Department of Medicine, New York University College of Medicine.

This investigation has been made with the assistance of a grant from the Committee on Therapeutic Research, Council on Pharmacy and Chemistry, American Medical Association.

1. Ralli, Elaine P.; Brandaleone, Harold and Mandelbaum, T.: Studies on the Effect of the Administration of Carotene and Vitamin A in Patients with Diabetes Mellitus: I. The Effect of the Oral Administration of Carotene on the Blood Carotene and Cholesterol of Diabetic and Normal Individuals, *J. Lab. & Clin. Med.* 20: 1266, 1935

Following each administration, blood carotene determinations were done at intervals of five, twenty-four, forty-eight and ninety-six hours and one week. A week after the second administration of 25 cc. of carotene in the normal subject and two weeks after in the diabetic patient, daily administrations of 5 cc. were begun. These were continued for twenty days in the diabetic patient, when owing to an error none was given for four days. It was begun again in doses of 10 cc.

Chart 1.—Effect of the daily administration of 1 cc. of 0.3 per cent carotene in oil on the blood carotene of three normal subjects and three diabetic patients. Solid line, diabetic patients; broken line, normal subjects.

daily and continued for ten more days. The carotene was then discontinued and the blood carotene was followed for a period of ten days. The normal individual received 5 cc. daily for twenty-nine days and the blood carotene was estimated at weekly intervals for twenty-eight days after the administration was discontinued.

Carotene was determined on the serum by the method of White and Gordon<sup>2</sup> and cholesterol on the plasma by the Bloor colorimetric method.<sup>3</sup> Blood sugar determinations were made but are not reported, as they bore no relation to the blood carotene.

#### RESULTS

The status of the patients studied and the diets and insulin given the diabetic patients are summarized in table 1. The effects of the daily administration of 1 cc. of 0.3 per cent carotene in oil in cases 13, 14 and 15, diabetic, and cases 16, 17 and 18, normal, are shown graphically in chart 1. In the three normal subjects the blood carotene rose after one week. In cases 16 and 18 the rise was 0.022 mg.; in case 17 it was 0.095 mg. This was followed by a fall the second week in cases 17 and 18 and then by a progressive increase, reaching a peak in cases 16 and 18 on the thirty-fifth day and on the eighty-fourth day in case 17. In the diabetic patient the increase was progressive from the start, with the exception of a fall of 0.014 mg. in case 13 the third week. The peak was reached after twenty-eight days in case 14, thirty-five days in case 15 and fifty-six days in case 13. In two diabetic patients

the absolute increase was greater than in the normal subjects, being 0.178 and 0.212 mg., while the greatest increase in the normal subjects was 0.136 mg. Case 15, normal, was followed for thirty-five days after the administration of carotene was stopped. The blood carotene fell progressively and on the thirty-fifth day was 0.189 mg. per hundred cubic centimeters. This was higher than prior to the administration of carotene. In the diabetic, cases 13 and 14 were followed for forty-two and forty-nine days respectively after carotene had been stopped. The blood carotene in case 13 had not returned to the original level forty-two days after carotene was discontinued. In case 14 there was a definite drop on the twenty-eighth day, and the blood carotene was still lower on the thirty-fifth day, but, although within the normal range at that time, was not as low as it had been prior to the administration of carotene. The fall in these two diabetic patients was slower than in the one normal subject followed.

In the normal and the diabetic receiving the larger daily doses of carotene a different set of conditions was established as a result of the previous administration of a total of 50 cc. of carotene. In table 2 we have reported the changes in blood carotene during each week following these large single doses. As these results are similar to those previously reported,<sup>4</sup> they require no further discussion.

When only a week was allowed to elapse in the normal after the second administration of 25 cc. of carotene, the fasting blood carotene was still elevated and was only 0.013 mg. lower than that of the diabetic. This made it possible to observe the effects of the further administration of carotene in a normal subject whose blood carotene was as high as that of a diabetic patient. We have shown in a previous study<sup>4</sup> that the average fasting blood carotene in a group of diabetic patients was 0.262 mg. per hundred cubic centimeters and in a group of normal subjects was 0.109 mg.

The effect of carotene in cases 19 and 20 is shown graphically in chart 2. In case 20, diabetic, the blood carotene rose after six days to 0.513 mg. per hundred cubic centimeters, while in the normal subject at this time it had risen only to 0.351 mg. The total rise at

this time was 0.243 mg. in the diabetic patient and 0.094 mg. in the normal subject. Even when the normal subject started with an increased carotene concentration in the blood, the rise was much less than in a diabetic patient. On the thirteenth day the blood carotene in the diabetic patient had risen to 0.540 mg. per hundred cubic centimeters and there was clinical evidence of carotenemia. The patient had at this time received 65 cc. of the carotene solution. The carotene-

\* The diet in case 19 was identical to the diet in case 20.

mia was most marked in the palms of the hands. Later the skin of the face had a definite yellow tinge. The yellow pigmentation of the face and hands persisted until ten days after the administration of carotene was stopped, and during this time the blood carotene remained at 0.540 mg. per hundred cubic centimeters. By the nineteenth day the yellow coloration of the skin had disappeared. The greatest increase in blood carotene in the diabetic patient was reached after twenty-nine days of carotene administration, at which time the patient had received, in daily doses, a total of 190 cc. of 0.3 per cent carotene in oil.

The normal subject received a total of 145 cc. of the carotene solution in a period of twenty-nine days. At the time when he had had 65 cc. the blood carotene was 0.350 mg. per hundred cubic centimeters, which was 0.190 mg. lower than in the diabetic patient. The greatest increase in blood carotene in the normal subject occurred seven days after carotene administration had stopped. During the administration of carotene the highest level was 0.486 mg. per hundred cubic centimeters and was reached on the twenty-eighth day. The blood carotene was determined at weekly intervals for four weeks after carotene was discontinued. By the fourth week it had fallen to 0.378 mg. per hundred cubic centimeters.

The blood cholesterol have not been charted, as the changes are similar to those previously reported.<sup>3</sup> The average cholesterol prior to carotene administration was 173 mg. per hundred cubic centimeters in the normal subjects and 205 mg. in the diabetic patients. The blood cholesterol was not followed in cases 19 and 20. In cases 13, 14 and 15, diabetic, there was a marked rise in cholesterol along with the rise in carotene only in case 15. The cholesterol in this patient rose from 218 to 257 mg. per hundred cubic centimeters and remained elevated during the period of carotene administration. In the normal subjects, cases 16, 17 and 18, the cholesterol increased along with the carotene in cases 16 and 17, rising from 176 to 227 mg. per hundred cubic centimeters in the former and from 172 to 227 mg. in the latter.

## COMMENT

The results in these four diabetic patients and four normal subjects show that even after continuous daily administration of carotene there is not as great an increase in blood carotene in the normal as in the diabetic individual. It seems to us that this tends to prove that dietary intake alone cannot account for the increase in blood carotene that is so often found in diabetic patients.<sup>5</sup> We have already<sup>1</sup> suggested an explanation for this increase in blood carotene in these patients; namely, that it is the result of a diminished ability on the part of the liver to convert carotene to vitamin A. Karrer<sup>6</sup> and others have shown that when the carotene molecule is split at its central double bond it will yield in the case of beta carotene two and in the case of alpha carotene one molecule of vitamin A. Moore<sup>7</sup> has shown that this transformation takes place in the liver. If the ability of the liver to accomplish this transformation should be diminished, carotene would accumulate there, absorption from the blood would be slowed up and a rise in blood carotene would result. This is still only a hypothesis, regarding which we hope that further investigation will provide more evidence.

As regards the production of carotenemia, we have observed this in three other diabetic patients and in each of them the blood carotene was above 0.500 mg. per hundred cubic centimeters. Apparently a concentration of carotene of at least this extent is necessary for the development of clinical carotenemia. Undoubtedly individual differences occur, depending on the rate of excretion through the skin.

## SUMMARY AND CONCLUSIONS

1. The effects of the daily oral administration of 0.3 per cent carotene in oil on the blood carotene of four normal and four diabetic individuals was observed for periods varying from one to four months.

2. Following the administration of 1 cc. of the carotene solution to three of the normal subjects and three

TABLE 2.—Effect of Two Doses of 25 Cc. of 0.3 Per Cent Carotene, Administered at Intervals of One Week, on the Blood Carotene in Case 19 and Case 20, Diabetic

Time	Case 19, Normal		Case 20, Diabetic

was a still greater increase in the blood carotene in the diabetic patient above that of the normal subject and clinical evidence of carotenemia appeared.

4. In three normal subjects and three diabetic patients the blood cholesterol was estimated. This rose with the blood carotene in one diabetic patient and in two of the normal subjects.

5. To explain this increase in blood carotene in diabetic patients, both before and after carotene administration, it is suggested that in the diabetic patients the ability of the liver to convert carotene to vitamin A is diminished, and that this results in an increased concentration of carotene in the liver, which interferes with the absorption of carotene from the blood.

## ACUTE NONCALCULOUS CHOLECYSTITIS

A STUDY OF THIRTY-ONE CASES

WILLIAM L. WOLFSON, M.D.

AND

ROBERT E. ROTHENBERG, M.D.

BROOKLYN

It is our purpose in this study to report those cases of acute noncalculous cholecystitis which have come under our observation in the past ten years. Certain distinguishing characteristics of the syndrome will be described and attention will be drawn to a possible hematogenous origin from some extrabiliary focus of infection.

Although gallbladder disease has been thoroughly discussed in the literature, little mention has been made of acute noncalculous cholecystitis. Judd and Phillips<sup>1</sup> reported 508 cases of acute gallbladder disease in which twenty-four, or 4.7 per cent, of the patients had no stones. In Blalock's<sup>2</sup> series, 4 per cent of 136 noncalculous cases presented a microscopic diagnosis of acute cholecystitis. Of Whipple's<sup>3</sup> 160 cases of acute cholecystitis, thirty patients had no stones. Mentzer<sup>4</sup> described thirty-eight cases of gangrenous cholecystitis, of which ten were noncalculous. None of these authors, however, discussed the importance of the noncalculous form of acute gallbladder disease as a distinct pathologic and etiologic entity.

This report on thirty-one patients who have undergone operation excludes all instances in which any doubt existed as to the presence or absence of calculi and includes only those cases in which the operating surgeon stated that no stones were present. These cases are part of a group of 379 cases of acute cholecystitis in which operation has been done since 1925.<sup>5</sup> When these figures are added to those of the aforementioned authors, it may be seen that in 1,221 cases of acute cholecystitis there are 100, or 8.1 per cent, of noncalculous cholecystitis (table 1).

It is interesting to note the high incidence of this disease in men. In this series, eighteen of thirty-one patients, or 58 per cent, were males, whereas in 348 cases of acute cholecystitis presenting cholelithiasis,<sup>5</sup> only eighty-three, or 23.8 per cent, of the patients were males. Blalock found no great disparity in his noncalculous cases, in which there were forty-seven males and fifty-three females. Furthermore, the age incidence is fairly well distributed and not predominant in any one decade of life. The old aphorism "fair, fat and forty" applied to females does not appear to hold true for the acute noncalculous form of the disease. It so happens that there is not one female between the ages of 40 and 50 years in this series (table 2).

Nine of our patients gave histories or showed signs of an extrabiliary infection preceding the cholecystitis. Patient 7 had been confined to bed with a respiratory infection diagnosed as "grip" for one week before the onset of abdominal symptoms. Patient 17 had suffered from pneumonia five weeks prior to the gallbladder infection. A note on the chart in case 18 stated that the patient had "grip" with a severe cough for the two months previous to admission for abdominal pain. Case 25 gave a history of peptic ulcer for the past fifteen years and on physical examination showed a purulent discharge from the right ear. Case 31 also gave a history of peptic ulcer, of two years' duration. Patients 2, 21 and 8 had acute pharyngitis on admission to the hospital; the latter told of frequent "sore throats." Patient 29 was admitted to the hospital with a second attack of acute cholecystitis. Inspection of his record showed that the first attack of cholecystitis had developed during his stay in the hospital the previous year, after admission for treatment of a septic sore throat.

The usual story in calculous cases of frequent previous attacks, indigestion, belching and aversion for fatty foods was noticeably absent in the majority of

5. Unpublished data from the Surgical Services of the Jewish Hospital of Brooklyn.

patients had been troubled with indigestion and belching previous to the onset of acute cholecystitis, only four of the eighteen male patients gave positive histories of these symptoms. Thus, only 38.7 per cent of the patients in this series had indigestion, as compared to 86 per cent of Blalock's patients with all types of cholecystitis who suffered from this symptom.

Acute noncalculous cholecystitis is usually a severe and fulminating infection. The patients appear sicker, more frequently have chills, and maintain a higher temperature range than those with acute cholecystitis caused by cystic duct stone. The average admission temperature of the patient with acute noncalculous cholecystitis was 101.9 F., while that of the 348 patients with acute calculous gallbladder disease<sup>5</sup> was 100.9 F. Of the patients, 46.4 per cent suffered from chills, a figure that is considerably higher than that found in calculous cases. This high incidence of chills may be indicative of the embolic phenomena that sometimes precede and lead to the production of gallbladder infection. The severity of this disease is shown by the high leukocyte

this symptom. One must interpret jaundice in noncalculous cases as caused by cholangitis with hepatitis rather than by obstruction.

Seventeen cholecystostomies and fourteen cholecystectomies were performed on the thirty-one patients. Sixteen surgical specimens consisting of fourteen gallbladders and two biopsies of the gallbladder were

TABLE 5—Summary of Symptoms and Signs

Average temperature on admission	101.9 F.
Average leukocyte count	15,600 per cu mm.
Average polymorphonuclear leukocytes	84.6 per cent
Cases with chills	46.4 per cent
Cases with right upper quadrant abdominal pain	83.5 per cent
Cases with exacerbating colic pain	32.2 per cent
Cases with back pain	63.3 per cent
Cases with girdling pain	20.6 per cent
Cases with right scapular pain	39.3 per cent
Cases with jaundice	25.8 per cent
Cases with right upper quadrant abdominal tenderness and rigidity	93.5 per cent

TABLE 3—Cases Admitted During Initial Attacks

	Number of Cases	Admitted with Initial Attacks	Per Cent
Female	13	4	30.7
Male	18	11	61.0
Totals	31	15	48.4

TABLE 4—Cases Presenting Aversion for Fatty Foods

	Number of Cases	Aversion for Fats	Per Cent
Female	13	5	38.4
Male	18	2	11.1
Totals	31	7	22.5

and polymorphonuclear leukocyte blood cell counts. The average leukocyte count for the thirty-one cases was 15,600 white blood cells per cubic millimeter of blood, with an average of 84.6 per cent polymorphonuclear leukocytes. There were four patients with counts under 11,000 white blood cells per cubic millimeter of blood, and five patients with less than 80 per cent of polymorphonuclear leukocytes.

The cases in this series showed a high incidence of pain in the right upper quadrant of the abdomen but a low incidence of excruciating colic-like pain. There were two patients without abdominal pain, and in only ten of the thirty-one patients was the pain of excruciating intensity. Tenderness and rigidity in the right upper quadrant of the abdomen were present in all but two of the thirty-one patients (table 5). Radiation of pain through to the back was present in 63.3 per cent of the patients, while girdling pain occurred in only 20.6 per cent and right scapular pain in 39.3 per cent of the cases. Jaundice was noted in three patients on admission to the hospital, and five others gave a history of previous attacks. Thus, eight of thirty-one, or 25.8 per cent, of the patients at one time or another had been jaundiced. Blalock pointed out that jaundice was almost as common in patients without stones as it was in patients with stones in the gallbladder. Thirty-seven per cent of Blalock's patients with acute and chronic noncalculous cholecystitis were jaundiced, and 44 per cent with stones in the gallbladder also displayed

reported by the pathologist. The microscopic diagnoses on these tissues were acute suppurative cholecystitis in ten cases, gangrene of the gallbladder in three cases, acute hemorrhagic cholecystitis in one case, phlegmonous cholecystitis in one case, and acute ulcerative cholecystitis in another case. Only three of the sixteen pathological reports bore notations significant of previous inflammation, as evidenced by round and plasma cell infiltration and muscular fibrosis, and only one of these three patients gave a history of a known previous attack of gallbladder disease. The operative notes on the fifteen cases in which no specimen was obtained showed nine patients with a gross diagnosis of gangrene of the gallbladder, one of which was thought to be due to a gas bacillus infection, and six patients with the diagnosis of acute suppurative cholecystitis. If the gross changes are grouped with the microscopic changes, the distribution of the types of lesions is as follows: acute suppurative cholecystitis, sixteen cases; gangrene

TABLE 6—Patients with Perforated Gallbladder

	Admission Temperature, F.	Duration of Symptoms Before Hospitalization
Case 13	104	20 days
Case 16	102.8	5 days
Case 20	102	35 days intermittently
Case 28	103	21 days
Case 29	104	30 to 40 days intermittently
Case 30	102	6 days

TABLE 7—Mortality Rate Male and Female

	Number of Cases	Lived	Died	Mortality, per Cent
Acute noncalculous cholecystitis, male	18	15	3	16.6
All types of acute cholecystitis, male	101	85	16	15.8
Acute noncalculous cholecystitis, female	11	13	0	0.0
All types of acute cholecystitis, female	278	262	16	5.8

of the gallbladder, twelve cases, and one case each of acute hemorrhagic cholecystitis, phlegmonous cholecystitis and acute ulcerative cholecystitis.

It is important to call attention to the high incidence of perforation in this series of cases, particularly since many surgeons advocate delay in operating on gallbladder disease during its acute phase. Perforation occurred in six of thirty-one, or 19.4 per cent, of the cases, five

of which were in males. It is interesting to note that all the patients with perforation gave a clinical history of several days' duration and had a temperature range to at least 102 F. Our experience has been that perforation must be considered a likely possibility in those cases presenting a sustained temperature range over 102 F. for thirty-six hours or longer. Table 6 shows the admission temperature of the patients in whom perforation had taken place and the notes relating to the duration of symptoms prior to hospital admission.

It has frequently been stated that the death rate for gallbladder disease is higher in males than in females. Table 7 corroborates this observation and shows that all three deaths were of men.

## COMMENT

Rosenow,<sup>6</sup> C. H. Mayo,<sup>7</sup> Rolleston,<sup>8</sup> A. L. Wilkie,<sup>9</sup> D. P. D. Wilkie,<sup>10</sup> Rehfuess and Nelson<sup>11</sup> and others believe that cholecystitis is often the result of hematogenous bacterial infection of the wall of the viscus, while Graham and his co-workers<sup>12</sup> think that cholecystitis is often the result of invasion of the wall of the gallbladder through the lymphatic channels from the liver. Granting the validity of these two theories, stones and cystic duct obstruction are unnecessary factors in the production of an acute inflammatory lesion, whether it is suppurative or gangrenous. Thus, an embolus to the cystic artery or one of its branches may produce a gangrenous lesion in a previously normal gallbladder, or a suppurative noncalculous cholecystitis may follow invasion of the wall by bacteria which enter through the cystic artery or lymphatics.

We believe that acute noncalculous cholecystitis is a distinct etiologic entity, produced by hematogenous infection rather than by obstruction of the cystic duct. The syndrome resembles an infection of hematogenous origin in that there is no predilection for either sex or for any one particular age group (table 2). Then too, almost one third of the patients gave histories or showed signs of a focal infection which might have served as the primary source of the gallbladder infection. Furthermore, the infrequent history of previous attacks and the low incidence of the usual prodromal symptoms of aversion for fats, indigestion and pyrosis lead us to believe that this type of gallbladder disease differs greatly in etiology and pathogenesis from acute calculous cholecystitis with cystic duct block (tables 3 and 4).

## SUMMARY

1. Thirty-one cases of acute noncalculous cholecystitis reported from a series of 379 cases of acute cholecystitis gives an incidence of 8.2 per cent.

2. Fifty-eight per cent of the patients were males.

3. Aversion for fatty foods, indigestion, belching, and a history of previous attacks are not as common in patients with acute noncalculous cholecystitis as in those with acute calculous cholecystitis.

4. Acute noncalculous cholecystitis is a disease accompanied by higher temperature range, greater incidence

of chills, greater morbidity and a greater incidence of perforation than other forms of acute cholecystitis.

5. It is our belief that acute noncalculous cholecystitis is produced by a hematogenous infection rather than by cystic duct obstruction.

6. The mortality in this group of thirty-one cases was 9.6 per cent. All deaths occurred in male patients.

## ZINC IONIZATION IN NASAL ALLERGY

L. B. BERNHEIMER, M.D.

CHICAGO

My purpose in this communication is:

1. To evaluate the clinical results obtained through zinc ionization of the nasal mucous membrane of twenty-five individuals suffering from hyperesthetic rhinitis, and ten with seasonal hay fever, the observations having been carried on over a period of fifteen months.

2. To make a comparison of the end results obtained in this series with the end results obtained by the use of escharotics in a series of twenty individuals suffering with hyperesthetic rhinitis and ten others with hay fever.

The technic employed for ionization was the application of a galvanic current of from 15 to 20 milliamperes to a solution of zinc sulfate for a period of from fifteen to twenty minutes. The solution of zinc sulfate was introduced into the nasal chamber either in the form of a jelly or with gauze packing. One side of the nose was treated during one sitting, a period of from five to seven days being allowed to elapse before the second side was treated. An inexpensive battery set with an ammeter was used to create current. Hurd<sup>1</sup> has observed that while each apparatus has its adherents, it makes no difference clinically or histologically which type of apparatus is used. Zinc was the sole electrolyte employed, as no advantage is apparent in the use of mixed electrolytes described by Warwick.<sup>2</sup>

## HISTOLOGIC OBSERVATIONS

Sections of mucous membrane taken at varying periods following ionization show immediate changes in the surface epithelium, varying from complete destruction of the epithelium to simple inflammatory processes attended by the usual cellular infiltration and vascular changes found in any instance of inflammation of mucous membrane. Sections taken periodically after ionization reveal that regeneration takes place in periods varying from three months to three weeks. The tendency to fibrosis was not marked, the subepithelial stroma showing little tendency to thickening after resolution was complete. Cilia usually remain absent, the surface of the epithelium being pseudostratified in form. McMahon<sup>3</sup> has observed similar epithelial changes following ionization of nasal mucosa in dogs, but fibrosis was more marked in these animals than in the series just described. Concerning the effects of ionization on cilia, one must recall that Hansel<sup>4</sup> has

shown that one of the histologic effects of allergic nasal disease itself is the loss of cilia.

The histologic changes following zinc ionization are similar to those following the application of trichloroacetic acid or phenol to the nasal mucous membrane. It was impossible to differentiate mucous membrane that had been ionized from mucous membrane that had been treated with escharotic, such as trichloroacetic acid or phenol. The periods of regeneration following ionization and application of escharotics were also similar.

#### CLINICAL OBSERVATIONS

**Hyperesthetic Rhinitis.**—Twenty-five persons suffering with nonseasonal allergic rhinitis were treated with zinc ionization. All gave typical allergic histories, having had trouble for from one month to seven years. All showed the usual pale waterlogged mucous membrane but at the time of treatment none had either allergic or infectious polyps, and none showed evidences of secondary sinus infection found so commonly in this type of allergic nasal disease. Seven had skin sensitivity to certain foods and inhalants, but, as usual in hyperesthetic rhinitis, skin tests were of questionable value. Ionization had no effect on the clinical course of the disease in twenty of the patients; i. e., 80 per cent. Five, or 20 per cent, were free from symptoms for from five to eleven months. The nasal mucous membrane of these five patients became pink and otherwise normal to macroscopic examination. These periods of remission are much longer than the usual periods of spontaneous remission observed frequently in the course of untreated hyperesthetic rhinitis with proved nonseasonal nasal allergy.

The records of twenty patients treated with trichloroacetic acid or phenol were examined in order to compare the results obtained with simple escharotics with those obtained with ionization. In all cases the escharotics were applied to the anterior tips of both middle turbinates, the medial and anterior lateral surfaces of both inferior turbinates, and both sides of the anterior septal wall. Of ten patients treated with phenol, four, or 40 per cent, had periods of remission prolonged for from five to nineteen months. Of the ten treated with trichloroacetic acid three, or 30 per cent, had periods of remission which lasted for from four months to two and one-half years.

**Hay Fever.**—The usual clinical course of hay fever of ten individuals was in no way altered by ionization. These ten individuals suffered with the autumnal type of seasonal nasal allergy and all showed definite skin sensitivity to ambrosial pollens. They had had seasonal symptoms for periods varying from three to thirteen years. Unsuccessful attempts had been made to desensitize six of these individuals by pollen injections during previous years. Four had received no previous treatment. Five of the ten had had pollen asthma complicating the hay fever prior to ionization. One developed pollen asthma following ionization, but so many varying factors presented themselves in an attempt to interpret the relationship of ionization to this complication that no conclusion could be drawn. The negative clinical results obtained through ionization in hay fever corresponded to those recently reported by Ramirez.<sup>5</sup> Ionization was instituted in all cases after the onset of symptoms, as recommended by Tobey.<sup>6</sup> No histologic

sections were made of the nasal mucous membrane of patients treated by ionization or escharotics because of the negative end results obtained. A group of hay fever patients treated with escharotics in the manner just described also gave uniformly negative results.

#### COMPLICATIONS FOLLOWING IONIZATION

1. **Anosmia.**—Two patients suffering from hyperesthetic rhinitis developed anosmia. Both of these patients had a normal sense of smell before ionization but lost the ability to detect unpleasant, pungent or mild, pleasant odors within twenty-four hours after ionization. Both complained of associated taste disturbances. This unfortunate complication persisted for four months with one patient and for seven months with the other. Both were private patients, and as neither was benefited by the ionization treatment these complications resulted in most unpleasant situations. My own relief was even greater than that of the patients' when the anosmia proved to be transitory. A period of seven months can seem interminable under certain circumstances.

It should not be forgotten that many persons suffering from hyperesthetic rhinitis have disturbances of the sense of smell resulting from the disease process itself. The rhinologist, therefore, for his own protection, should test the patient's sense of smell before employing ionization, just as the ophthalmologist tests vision before removing a foreign body.

2. **Sphenopalatine Neuritis.**—One patient developed a unilateral headache referred from the eye on the affected side to the lower occipital region and down into the neck and shoulders. The pain was typical of the syndrome described by Sleuder. It persisted for three and one-half months with short periods of remission following application of cocaine to the sphenopalatine foramen. The patient refused to submit to alcohol injection.

No complications have ever been noted from the use of escharotics.

#### CONCLUSIONS

1. The histologic effects of ionization of the nasal mucous membrane do not differ from those resulting from the application of escharotics to the nasal mucous membrane. In neither instance is there marked evidence of fibrosis.

2. The clinical course of hyperesthetic rhinitis was influenced in only 5 per cent of twenty-five patients who were treated with ionization. Slightly better results were obtained through the use of escharotics.

3. The clinical course of hay fever was not altered by the use of either ionization or escharotics.

4. Ionization of the nasal mucous membrane carries a definite risk of complications that do not present themselves through the use of escharotics.

**Vectors of Yellow Fever.**—When it was first proven that yellow fever is transmitted by *Stegomyia fasciatus*, now called *Aedes aegypti*, it was believed that this mosquito was the only vector of the disease. We now know that there are more than a dozen mosquitoes that transmit the virus under laboratory conditions, some of them quite readily. We know also that yellow fever is endemic in areas where *Aedes aegypti* do not exist and we do not yet know what the vector in those areas is.—Lloyd, B. # Clinical Notes, Suggestions and New Instruments

## SIMPLIFIED APPARATUS FOR THE ADMINISTRATION OF PARENTERAL FLUID

CARL W. WALTER, M.D.  
Arthur Tracy Cabot Fellow in Surgery  
BOSTON

The production of a reliable supply of parenteral fluids, in otherwise adequately equipped hospitals, has been hindered by the lack of simple apparatus in which chemically pure solutions can be dispensed safely and economically. The apparatus<sup>1</sup> illustrated (fig. 1) was designed to provide easy sterilization, safe storage under hermetic seal, and ready administration from the original container.

Fig. 1.—Apparatus for administration of parenteral fluid. Preparation, sterilization, storage and administration of fluid are accomplished in individual flasks. The necessary glassware, tubing and needles are sterilized in a central supply room.

The new apparatus consists of a stainless steel stopper,<sup>2</sup> which fits a rubber bushing<sup>3</sup> inserted into the mouth of a thick-walled, short necked 1,500 cc. pyrex flask.<sup>1</sup> The flask is emptied by substituting for the stem of the steel stopper a pyrex tube, which is provided at one end with a capillary orifice which acts as an air valve and at the other end with the usual rubber tubing connector.

When the stem of the stopper is partially inserted into the rubber bushing, the channel cut into its lower third provides an adequate vent for the escape of air and steam during sterilization (fig. 2 A). On removal from the autoclave the stopper is pushed the remainder of the way into the bushing, forming a hermetic seal (fig. 2 B). The contraction of the contents of the flask during cooling produces a moderate vacuum, which aids in maintaining the seal. The inrush of air when the stopper is removed assures the user of the sterility of the contents of the flask.

<sup>1</sup>From the Surgical Clinic of the Peter Bent Brigham Hospital and the Laboratory of Surgical Research, Harvard Medical School.

<sup>2</sup>Made by Arthur H. Gerry, Boston.

<sup>3</sup>Made by H. O. West, Philadelphia.

The rubber bushing is molded of nontoxic, heat resistant rubber, which retains its resilience after repeated sterilization. The pyrex vent tube is sufficiently rugged to withstand the mechanical and thermal shock to which it may be subjected during ordinary usage.

### Directions for Making Various Solutions

No.	Solution	Chemicals in Stock Solution	Net Weight of Stock Solution	Cc. Added to Flask	Net Weight of Flask*
1	5% dextrose in distilled water	1,000 Gm. dextrose C. P.	2,355 Gm.	100	1,000 Gm.
2	10% dextrose in distilled water	1,000 Gm. dextrose C. P.	2,355 Gm.	200	1,085 Gm.
3	0.85% saline solution	170 Gm. sodium chloride C. P.	1,108 Gm.	50	1,040 Gm.

\* Allowance has been made for a 5 per cent loss during sterilization.

Fig. 2.—A, channel in stopper permits escape of air and steam during sterilization. B, air enters capillary orifice to relieve negative pressure within the inverted flask. C, vacuum seal produced by inserting stopper into bushing and permitting flask to cool.

After the steel stopper has been pulled from the flask by a twisting motion and the inrush of air has been noted, the vent tube is pushed into the hole in the rubber bushing as far as the shoulder. The flask is then inverted and hung in the split ring.

bracket\* (fig. 2 C). The rubber tube and needle are filled with solution and the infusion may be started.

The technic of cleaning the glassware, rubber goods and needles described in a previous communication must be followed rigidly.<sup>5</sup> The preparation of the solution can be facilitated by using the technic illustrated (fig. 2). Fresh, singly distilled water is drawn from the pyrex carboy, which is used to collect the immediate supply only. The carboy is drained each night and sterilized with live steam each morning.

Isotonic sodium chloride solution (0.85 per cent) is prepared from a fresh stock solution made by adding distilled water to 170 Gm. of chemically pure sodium chloride, previously weighed out in a counterbalanced flask, until a net weight of 1,108 Gm. has been reached. The flask is stoppered with a clean rubber stopper and shaken until solution is complete. This solution is then filtered, with the aid of suction, directly into a 300 cc. pyrex buret. Fifty cubic centimeters of the filtrate is measured

Fig. 3.—Simple technic for the preparation of solutions, which avoids mass filtration and volumetric transfer of fluid.

into a counterbalanced 1,500 cc. pyrex flask, and distilled water is added to a net weight of 1,049 Gm.<sup>6</sup> A clean rubber bushing is fitted into the mouth of the flask, its skirt is turned down, and the stem of the steel stopper is partially inserted into the bushing.

The flasks are then autoclaved for twenty minutes at 250 F. After sterilization the steam supply to the autoclave is shut off and the autoclave permitted to cool to 180 F. before it is opened. In this way the concentration of solution resulting from the ebullition of steam that follows sudden relief of pressure is avoided. As the flasks are removed from the autoclave, the steel stoppers are pushed in to complete the seal.

The sterile solutions can be stored indefinitely without impairing their value as safe parenteral fluids. If a sufficient supply of sterile sets of pyrex vent tubes, rubber tubing and needles is kept on hand, the solutions are instantly available and rational parenteral therapy is constantly at the disposal of the clinician.

## Special Article

### TYPHOID IN THE LARGE CITIES OF THE UNITED STATES IN 1935

#### TWENTY-FOURTH ANNUAL REPORT

This report deals with the same ninety-three cities that have been discussed in the corresponding articles for the years beginning with 1930. The number of deaths from typhoid during 1935 in each city (except Scranton, as explained in a note to table 2) has been supplied by the respective health department. The United States Bureau of the Census is working out a new method for estimating the populations of the large cities in view of the extraordinary changes in urban and rural distribution since 1930; but as such estimates are not yet available the rates in the present article are based on the same population figures as were used for the 1934 rates; namely, the estimates for midyear 1933 as computed by the Bureau of the Census according to a method described in our last year's report.

TABLE 1.—Death Rates of Fourteen Cities in New England States from Typhoid per Hundred Thousand of Population

\* Rate computed from population as of April 1, 1930, as no estimate for July 1, 1933, was made by the Census Bureau.

Deaths from paratyphoid, when these were specified in the reports made to us by a health department, have been excluded from the deaths on which we have based the typhoid death rate. This follows the distinction set by the latest edition of the *Manual of International Causes of Death* (edition 4, 1931); in the previous edition (1921) typhoid and paratyphoid were grouped together. The paratyphoid deaths thus excluded, beginning with 1931, have been as follows: Cleveland, one paratyphoid death in 1931 (thirty-one typhoid deaths); Jacksonville, one paratyphoid death in 1933 (one typhoid death also in that year);<sup>1</sup> Knoxville, two paratyphoid deaths in 1935 in addition to six typhoid deaths; New Haven, one paratyphoid death in 1934 and one in 1935 (no typhoid death in either year); New York, one paratyphoid death in 1931 (seventy-

The preceding articles in this series were published in *THE JOURNAL*, May 31, 1913, p. 1702; May 9, 1914, p. 1473; April 17, 1915, p. 1322; April 22, 1916, p. 1305; March 17, 1917, p. 845; March 16, 1918, p. 777; April 5, 1919, p. 997; March 6, 1920, p. 672; March 26, 1921, p. 860; March 25, 1922, p. 890; March 10, 1923, p. 691; Feb. 2, 1924, p. 389; March 14, 1925, p. 813; March 27, 1926, p. 948; April 9, 1927, p. 1148; May 19, 1928, p. 1624; May 18, 1929, p. 1674; May 17, 1930, p. 1574; May 9, 1931, p. 1576; April 30, 1932, p. 1550; May 13, 1933, p. 1491; May 19, 1934, p. 1677, and June 8, 1935, p. 2093.

1. The Jacksonville typhoid death rate for 1933 was erroneously figured without excluding the paratyphoid death. Its correct 1933 rate should therefore be 0.7 instead of 1.4. The following corrections should be made in the tables in the 1933 article: tables 3 and 9, change Jacksonville rate to 0.7; table 10, for 1933 the number of cities with rates 1.0 to 1.9 is 18, with rates 0.1 to 0.9 is 34; table 11, third footnote, total typhoid deaths number 469; table 12, South Atlantic typhoid deaths number 54 and the group rate is 2.28.

six typhoid);<sup>2</sup> Oakland, two paratyphoid deaths in 1934 (also two typhoid deaths); Wichita, two paratyphoid deaths in 1935 (no typhoid deaths); Wilmington, one paratyphoid death in 1932 (also one typhoid death in that year).

The problem of including in the rates for each city the typhoid rate for nonresidents is still conspicuous.

\* Incomplete data.

† Typhoid deaths for Scranton furnished by Pennsylvania Department of Health, Harrisburg.

In twenty-four of the ninety-three cities we are informed that one third or more of the typhoid deaths were in nonresidents. These are indicated in table 9 and should be also referred to in examining tables 1 to 8.<sup>3</sup> Complete data are unavailable for a few cities as described (tables 2 to 8, "incomplete data") in the report covering the year 1932.

Six of the large New England cities had no typhoid deaths in 1935 (table 1), four of them for the second year in succession. The quinquennial average 1931-1935 is particularly interesting since it shows that all but two of the New England cities (New Haven, Springfield) had lower average rates than for the preceding five years. Bridgeport has had the lowest

\* Incomplete data.

† Rate computed from population as of April 1, 1930, as no estimate for July 1, 1933, was made by the Census Bureau.

‡ This rate in our two previous articles was given as 1.4, owing to the erroneous inclusion of one paratyphoid death.

average rate for the ten-year period 1926-1935. The New England group as a whole (population 2,624,805) recorded for 1935 the lowest group rate (0.49) yet reached by that group and also the lowest ever recorded

2. The paratyphoid death in New York in 1931 was included by mistake in the total deaths on which the typhoid rate was calculated. Its exclusion does not change the New York rate for the year (1.1) or the Middle Atlantic group rate (1.06) but it lessens by one the totals for the country in tables 11 and 12 in the article covering the year 1931.

3. The problem of the nonresident has been discussed at some length in our previous reports; for example, J. A. M. A. 100:1491 (May 13) 1933 and 98:1550 (April 30) 1932.

by any of the eight geographic divisions. This is the seventh year of progressive decline in the typhoid group rate for the New England cities (table 12).

The Middle Atlantic cities (table 2) have likewise had for the past four years a group rate under 1.0, thus continuing a progressive decline. As in 1934, seven of the eighteen cities report the complete absence of typhoid deaths, Elizabeth for the fourth consecutive year. Scranton, which had the highest rate of the group in 1933, reported no typhoid deaths in 1934 or 1935. Jersey City likewise completes its second consecutive year without a typhoid death. Pittsburgh's rate (0.6) is better than in 1934, although not equal to the conspicuously low rate (0.1) for 1933. The

four cities in this group with a population of more than half a million all had rates under 1.0, New York for the fourth consecutive year, Philadelphia and Buffalo for the third. The typhoid rate in Camden still ranked highest in 1935, as did its average for the quinquennial period.

One of the South Atlantic cities (Jacksonville) reports no typhoid deaths in 1935. Atlanta's rate (4.6), while higher than 1934 (3.9), is still well below the other rates of recent years and the city again, as in 1934, no longer occupies its long held position in the highest rank in the country. Atlanta hospitals serve a 40-mile radius from the city, so that the proportion of nonresident deaths is large. Baltimore had about the same rate (1.5) in 1935 as in 1934 (1.3), but four

TABLE 5.—*Death Rates of Six Cities in East South Central States from Typhoid per Hundred Thousand of Population*

\* Incomplete data.

of the twelve deaths are stated to be in nonresidents. The group rate for the South Atlantic cities (2.58) is slightly higher than for the three preceding years, but its quinquennial average 1931-1935 shows a marked improvement over the preceding five year period.

After the decided increase in typhoid mortality which occurred in the cities of the East North Central group

(table 4) in 1934, the rate has dropped back almost to the 1933 level, with fifty-eight deaths in 1935 as against eighty-eight and fifty-four in 1934 and 1933 respectively. Five cities had clear typhoid records in 1935, and twelve had rates under 1.0 as against eight in 1934. Three cities had higher typhoid rates in 1935 than in 1934, the most noteworthy increase being in Evansville

1935. The other four cities reversed this picture. Louisville and Memphis record their lowest rates since 1930. Chattanooga dropped from 8.1 to 2.4. The group as a whole shows a notable diminution of the typhoid average for the last five years (table 12).

In the West North Central cities (table 6) the typhoid mortality in 1935 was considerably less than in 1934, twenty-three deaths as against forty. It is to be noted, however, that the population in this geographic

division is very close to that of the New England cities, while the number of typhoid deaths is nearly twice as great both for the years 1934 and 1935 (table 12) and for the quinquennial period. It is encouraging that the group rate for the West North Central cities for

\* All the typhoid deaths reported were stated to be in nonresidents.  
† One third or more of the reported typhoid deaths were stated to be in nonresidents.

1935 is for the first time under 1.0. Two of the nine cities, Omaha and Wichita, report no typhoid deaths in 1935, Wichita's being the second successive clear record and the fifth one in its history. Des Moines, after its abrupt rise in 1934, subsides to its 1933 level, but its typhoid mortality still ranks as the highest in the group.

The West South Central cities in 1935 showed a conspicuous improvement, with the lowest group rate (3.82) they have ever attained. These cities had only

TABLE 10.—*Number of Cities with Various Typhoid Death Rates*

1931.....	93	2	6	23	28	22	12
1932.....	93	1	7	17	29	29	14
1933.....	93	0	7	16	19	33	16
1934.....	93	0	9	11	27	23	2†
1935.....	93	0	7	15	18	29	2†

seventy-four typhoid deaths in 1935 as against 105 and 106 respectively in the two preceding years. With the single exception of El Paso, all the cities had lower rates in 1935 than in 1934. Tulsa continues to have the lowest rate in the group, as it has had every year beginning with 1930, and its 1935 rate (0.7) is definitely lower than the abrupt increase shown in 1934.

Two cities in this group, New Orleans and El Paso, had the highest rates in the country (7.4 and 7.6), as shown in table 9. Less improvement in this group than in the East South Central cities is shown also in the quinquennial average.

The cities in the Mountain and Pacific states (table 8) had a slight increase in typhoid mortality in

Of the thirteen cities in the country with more than 500,000 population, all but Baltimore had 1935 typhoid rates below 1.0. Twenty-four cities had no typhoid deaths at all in 1934, the largest number with a perfect score yet reported. Six of these were New England cities and seven Middle Atlantic. Eleven of the twenty-four cities had had no typhoid deaths in 1934 and two of them (Elizabeth and Grand Rapids) have had no typhoid deaths in four years.

Eight cities (five of them in New England) had no deaths from either typhoid or diphtheria in 1935 (Bridgeport, Cambridge, Erie, New Bedford, New Haven, Scranton, Springfield, Tacoma). It is the second successive year that New Haven has had a clear record for both diseases, a record equaling that of Elizabeth for 1933 and 1934.

There are twenty-two cities in 1935 with rates of 2.0 or over (table 9, second and third ranks) as against twenty in 1934. The highest typhoid rate reported in any city is for the first time below 8.0. Of the twenty-two cities with 1935 rates of 2.0 and over, five are Northern cities (Camden, Columbus, Evansville, Des Moines, Waterbury).

The total of typhoid deaths for the ninety-three cities is notably less in 1935 than in 1934 (385 as against 470). For the seventy-eight cities for which we have complete data since 1910 (table 11) the 1935 total of typhoid deaths is 348, as compared with 413 for the preceding year and the typhoid rate 0.98 as against 1.17.

In six of the eight geographic divisions of the country there were fewer typhoid deaths in 1935 than in 1934, slight increases occurring in the South Atlantic and the Mountain and Pacific groups. For the first time five of the eight groups registered rates below 1.0, and all are below 4.0.

TABLE 11.—Total Typhoid Rate for Seventy-Eight Cities, 1910-1934\*

	Population	Typhoid Deaths	Typhoid Death Rate per 100,000
1910	22,573,435	4,637	20.54
1911	23,211,341	3,950	17.02
1912	23,835,399	3,132	13.14
1913	24,457,989	3,285	13.43
1914	25,091,112	2,781	11.08
1915	25,713,346	2,434	9.47
1916	26,257,550	2,191	8.34
1917	26,865,408	2,016	7.50
1918	27,086,696†	1,824†	6.73
19 9	27,735,083†	1,151†	4.15
1920	28,244,878	1,088	3.85
1921	28,859,062	1,141	3.90
1922	29,473,246	963	3.26
1923	30,087,430	950	3.16
1924	30,701,614	943	3.07
1925	31,315,598	1,079	3.44
1926	31,929,782	907	2.84
1927	32,543,966	648	1.99
1928	33,158,150	628	1.89
1929	33,772,334	537	1.59
1930	34,386,717	554	1.61
1931	35,137,915	563	1.60
1932	35,691,815	442	1.24
1933	35,691,815	423	1.18
1934	35,401,715	413	1.17
1935	35,401,715	348	0.98‡

\* The following fifteen cities are omitted from this table because data for the full period are not available: Canton, Chattanooga, Dallas, Fort Wayne, Jacksonville, Knoxville, Long Beach, Miami, Oklahoma City, South Bend, Tampa, Tulsa, Utica, Wichita, Wilmington

† Data for Fort Worth lacking

‡ The rate for the ninety-three cities in 1935 is 1.03 (total population 37,437,812, typhoid deaths 385), whereas in 1930 it was 1.64, and in 1933 and 1934 it was 1.24 and 1.25, respectively. The 1931-1935 average for the ninety-three cities is 1.31

1935 as compared with 1934 (thirty-five deaths as against thirty) and for the first time since 1929 the decline in the group rate was halted. In 1935 three cities in this group record no typhoid deaths as against two in 1934. For Tacoma it is the second successive year of freedom from typhoid mortality and the third in its history. Long Beach had no typhoid deaths in

Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORTS  
HOWARD A. CARTER, Secretary.

PAVAEX UNIT ACCEPTABLE  
(Passive Vascular Exerciser)

Manufacturer: Taylor Instrument Companies, Rochester, N. Y.

Distributor: Cincinnati Scientific Company, Cincinnati

This apparatus is recommended by the firm for the administration of suction-pressure therapy, particularly in the treatment of peripheral vascular diseases

The motor for this unit is enclosed in a rectangular case, about 3 feet high, mounted on casters. A supporting carriage is available. On one side is the control panel for regulating the positive and negative pressures and the frequency of rate of adjustment. At one end is the rubber tube leading to the boot and the plug for the electric cord

The "boot" is of heavy "Pyrex" glass and is fitted with a manometer for measuring both positive and negative pressure and a tube to connect with the motor. Three sizes of rubber cuffs are supplied, which establish a relatively air-tight joint between the patient and the boot. The cuff is joined to the boot by a metal connection about 6 inches long, and the mechanism by which the cuff and the boot are connected is simple and apparently satisfactory.

This apparatus was investigated in a clinic acceptable to the Council. The investigator reported that the mechanical performance of the unit was satisfactory, that it brings about the alternations of suction and pressure in the boot in the manner claimed, and that it is of therapeutic value in certain cases of vascular disease.

TABLE 12.—Total Typhoid Death Rate per Hundred Thousand of Population for Ninety-Three Cities According to Geographic Divisions

	(1933) Population	Typhoid Deaths		Typhoid Death Rates						
		1935	1934	1935	1934	1933	1935	1936	1925	
New England	2,624,805	13	14	0.49	0.53	0.65	0.70	1.31	2.48	
Middle Atlantic	12,952,200	72	82	0.55	0.63	0.78	0.80	1.40	2.97	
South Atlantic	2,267,207	61	50	2.58	2.11	2.31	2.70	4.50	7.01*	
East North Central	9,643,100	58	88	0.60	0.91	0.55	0.75	1.29†	2.22†	
East South Central	1,242,600	49	61	3.94	4.91	4.81	8.31	13.00		
West North Central	2,704,500	23	40	0.85	1.48	1.51	1.24	1.83	3.43	
West South Central	1,934,800	74	105	3.92	5.43	5.40	5.36	7.32‡	13.08‡	
Mountain and Pacific	3,965,400	35	20	0.88	0.75	0.82	0.88	1.80	2.33	

\* Lack data for Jacksonville and Miami

† Data for South Bend for 1925-1929 are not available.

‡ Lack data for Oklahoma City in 1926

§ Lack data for Oklahoma City.

1935 or in 1931 or 1932. San Diego, which has a clear record in 1935, had no typhoid deaths also in 1930. Denver and Spokane have both improved their position in the group and San Francisco, while not equaling its remarkable record of 0.1 for 1933 and 1934, still makes an excellent showing (0.8), two of its five typhoid deaths being reported as in nonresidents.

Some indications for the use of this type of apparatus appear to be acute vascular occlusion, freezing, and vascular diseases with major involvement of the large vessels. Contraindications appear to be thrombophlebitis, cellulitis or lymphangitis (acute or subacute); extensive destruction of the arteriolar or capillary vessels, advanced thrombo-angiitis obliterans with capillary stasis, and advanced arteriolar sclerosis with capillary stasis, and venous thrombosis.

Pavaex Unit.

This apparatus has a very limited field of usefulness and probably therefore does not belong in the armamentarium of the average physician. It belongs more in the realm of hospital equipment, since most of these rare arterial diseases are hospital cases.

In view of the satisfactory performance of this unit with reference to the treatment of acute vascular occlusion, freezing and vascular diseases with major involvement of the large vessels, the Council on Physical Therapy voted to include the Pavaex Unit (Passive Vascular Exerciser) in its list of accepted devices.

#### McKESSON OXYGEN TENT ACCEPTABLE

Manufacturer: McKesson Appliance Company, Toledo, Ohio.

The manufacturer recommends this oxygen tent for use in the treatment of pneumonia, cardiac disease, asphyxia, following brain and chest injuries from restricted breathing, and asphyxia neonatorum.

The tent proper has a capacity of 15 cubic feet and is equipped with four large noninflammable windows. The tent will fold for transportation and storage. It is adjustable in height and can be transported in an automobile. The ice chamber has a capacity of 50 pounds and the sides have one-inch insulation. The dimensions are 14½ by 20¾ by 30½ inches.

The blower is driven by a 110 volt universal variable speed motor, which is controlled by a rheostat. The capacity of the blower is 100 cubic feet free air per minute. The unit is equipped with an oxygen meter and oxygen regulator, together with a safety light which gives a warning that the oxygen is about exhausted. The entire unit is finished in green lacquer trimmed with chromium metal plated parts. The shipping weight is about 205 pounds. The unit is not equipped with a gas tank.

The unit seems to be well constructed and convenient to operate. The fabric is lightweight material, which allows some light to pass through to the patient. The double slide fastener opening permits easy access to care for the patient. The temperature is readily controlled and the humidity may be kept below the levels required. The soda lime is in a built-in container, and the carbon dioxide may be kept below 2 per cent with a moderate amount of soda lime changed once daily. The oxygen control of 55 to 60 per cent readily maintained depends on the amount of necessary handling of the patient. In the use of any type of oxygen tent the Council strongly urges the use of the gas analysis instrument for determining oxygen and carbon dioxide.

In a clinic acceptable to the Council, the unit was tested. The investigation substantiated the physical and therapeutic claims made by the manufacturer.

In view of the satisfactory performance of the unit, the Council on Physical Therapy voted to include the McKesson Oxygen Tent in its list of accepted apparatus.

McKesson Oxygen Tent.

## Committee on Foods

### ACCEPTED FOODS

THE FOLLOWING PRODUCTS HAVE BEEN ACCEPTED BY THE COMMITTEE ON FOODS OF THE AMERICAN MEDICAL ASSOCIATION FOLLOWING ANY NECESSARY CORRECTIONS OF THE LABELS AND ADVERTISING TO CONFORM TO THE RULES AND REGULATIONS. THESE PRODUCTS ARE APPROVED FOR ADVERTISING IN THE PUBLICATIONS OF THE AMERICAN MEDICAL ASSOCIATION, AND FOR GENERAL PROMULGATION TO THE PUBLIC. THEY WILL BE INCLUDED IN THE BOOK OF ACCEPTED FOODS TO BE PUBLISHED BY THE AMERICAN MEDICAL ASSOCIATION. FRANKLIN C. BING, Secretary.

ANCHOR BRAND OLEOMARGARINE  
GOLDEN CREST BRAND OLEOMARGARINE  
MAYFLOWER BRAND OLEOMARGARINE  
OHIO MAID BRAND OLEOMARGARINE  
SUNLIGHT BRAND OLEOMARGARINE  
WISCONSIN MAID BRAND OLEOMARGARINE

(CONTAIN 0.1 PER CENT OF SODIUM BENZOATE)

Manufacturer.—The Cudahy Packing Company, Chicago.

Description.—Margarine prepared from hydrogenated, refined oleo oil and cottonseed oil, pasteurized cultured skim milk and salt. Contains 0.1 per cent of sodium benzoate.

Manufacture.—The mixture of hydrogenated fats is heated to 49 C. and churned with pasteurized, cultured skim milk and salt. The resulting emulsion is solidified by chilling, again churned with additional salt, refrigerated, molded into prints and automatically wrapped and packed in cartons.

Analysis (submitted by manufacturer).—

	per cent
Moisture .....	13.6
Total solids .....	86.4
Ash .....	3.5
Sodium chloride .....	3.5
Fat (ether extract) .....	81.9
Protein (N × 6.25) .....	0.3
Carbohydrates other than crude fiber (by difference) ..	0.7

Calories.—7.4 per gram; 210 per ounce.

#### CELLU BRAND RHUBARB, WATER PACKED

Distributor.—Chicago Dietetic Supply House, Inc., Chicago.

Packer.—Geneva Preserving Company, Geneva, N. Y.

Description.—Canned rhubarb, packed in water.

Manufacture.—Selected rhubarb is harvested at the proper degree of maturity, trimmed, automatically cut into pieces, washed and filled into cans, which are filled with hot water, sealed and processed.

Analysis (submitted by distributor).—

	per cent
Moisture .....	94.8
Total solids .....	5.2
Ash .....	0.7
Fat (ether extract) .....	0.7
Protein (N × 6.25) .....	0.5
Crude fiber .....	1.0
Starch (diastase method) .....	1.9
Carbohydrates other than crude fiber (by difference) ..	2.3

Calories.—0.2 per gram; 6 per ounce.

Claims of Manufacturer.—Choice quality rhubarb packed without added sugar or salt. For use in special diets in which sugar or salt is proscribed or in quantitative diets of calculated composition.

#### STANDBY BRAND EVAPORATED MILK

Distributor.—Gamble-Robinson Company, Minneapolis.

Packers.—Manufacturers of accepted brands of evaporated milk.

Description.—Canned, sterilized, unsweetened, evaporated milk; the same as Van Camp's Evaporated Milk (THE JOURNAL, June 8, 1935, p. 2097).

#### LUSH'US BRAND EVAPORATED MILK

Distributor.—General Grocers Co-op. Corp., Chicago.

Packer.—Amboy Milk Products Co., Amboy, Ill.

Description.—Sterilized, unsweetened evaporated milk. The same as Amboy Brand Evaporated Milk (THE JOURNAL, May 7, 1932, p. 1655).

## THE LEUKOPENIC INDEX AND FOOD ALLERGY

The search for methods of identifying food allergy more accurate than the methods now in use, namely, tests of cutaneous sensitization, food diaries and exclusion diets, has led recently to the clinical study of the so-called leukopenic index described by Vaughan<sup>1</sup> in 1934. Allergic hypersensitivity to a food is considered to exist, according to this test, if ingestion of the food is followed by a significant fall in the total leukocyte count. A rise in the leukocyte count following ingestion of a food is said to indicate lack of allergic reaction to a food or normal "digestive leukocytosis." Although at first Vaughan<sup>2</sup> considered a fluctuation of 2,000 in the number of leukocytes per cubic millimeter of blood as within the limits of normal, subsequently he regarded a drop of more than 1,000 leukocytes as positive evidence of allergic response. Gay<sup>3</sup> has considered that if the number of leukocytes falls 200, 400, 600, 800 or more below the fasting average the drop is significant and that the foods which cause the drop are "incompatible." In his hands "the leukopenic index has proved to be an aid of unexpected reliability and accuracy, not only in determining the allergic state but in determining the actual allergens at fault."

Whether or not the ingestion of a certain food by a person sensitive to that food is followed by a drop in the total leukocyte count, careful routine laboratory methods of counting leukocytes show that normal fluctuations in the total leukocyte counts of normal persons in a fasting state are much greater than the fluctuations on which this test has been based. Thus Mauriac and Cabouat<sup>4</sup> demonstrated definite variations in the total leukocyte counts of normal persons when the counts were made at intervals of an hour. They also found

fluctuations of as much as 3,000 leukocytes in fifteen minutes and predicted that if it were possible to examine the blood every minute the frequency and suddenness of the oscillations of the leukocyte count would be even more evident. Within a half hour they noted a change in leukocyte count from 12,300 to 6,500 per cubic millimeter of blood. Sabin, Cunningham, Doan and Kindwall<sup>5</sup> clearly demonstrated marked fluctuations in the total leukocyte count in the fasting, resting state when counts were made at intervals of fifteen minutes. Shaw<sup>6</sup> stated that the minimal variation between two counts made fifteen minutes apart, with the patient in the resting, fasting state, ranged from 32 per cent to 10 per cent, while the maximal variation ranged from 51 per cent to 19 per cent. Medlar<sup>7</sup> showed that the total leukocyte count of a normal person under carefully standardized conditions may vary 50 per cent in less than half an hour. When the total leukocyte count was taken at intervals of three minutes over a period of an hour, it varied from 4,300 to 7,600 per cubic millimeter of blood. When two other subjects were studied at intervals of five minutes for periods of one hour and of two hours, the total leukocyte count varied from 5,800 to 9,400 and from 5,300 to 8,300, respectively.

Ponder, Saslow and Schweizer<sup>8</sup> explained some of the fluctuations noted in the foregoing on the basis of the error inherent in the technic, believing that the chief source of error was imperfect distribution of cells in the counting chamber. They felt that had larger numbers of cells (approximately 800 cells, in both sides of two counting chambers) been counted in the experiments reported by Sabin, Cunningham, Doan and Kindwall, the fluctuations found would have been less striking. Although Jones, Stephens, Todd and Lawrence<sup>9</sup> felt that the variations in the total leukocyte count were small, they demonstrated fluctuations of 1,000 to 2,000 cells in counts made at successive intervals of fifteen minutes and a variation of as much as 3,100 in seventy-five minutes.

Simpson<sup>10</sup> concluded, "leukocyte counts of healthy people vary continually and show that definite changes may occur in them, not only in a quarter of an hour, but even in a minute." Washburn<sup>11</sup> has demonstrated hourly fluctuations in the total leukocyte count of normal infants at ages of from one day to twenty-four weeks.

Total leukocyte counts made in an exacting manner on the blood of normal persons seem therefore to be subject to considerable fluctuation. The admonitions of Mauriac and Cabouat in 1921 and of Simpson in 1933 to the effect that it is necessary to be cautious in attributing these fluctuations to any specific cause are still timely. Final decision on the value of the leukopenic index in diagnosis of food allergy might be hastened, therefore, if contributors on the subject would give detailed information as to the exact technic used, together with protocols of observations and counts sufficient for statistical analysis.

#### DR. JOHN GORRIE OF APALACHICOLA

One hundred years ago the major medical problems in Apalachicola, Florida, were malaria and yellow fever. Although the city was already one of the large cotton markets on the Gulf Coast, further development was retarded by the prevalence of these and other serious febrile diseases. Then John Gorrie,<sup>1</sup> a graduate of the College of Physicians and Surgeons in New York, came to Apalachicola in 1833 to practice medicine. After some years of clinical observation, he wrote a series of articles for the *Lancet* on "The Equilibrium of Temperature as a Cure of Pulmonary Consumption," and for the local paper on the prevention of malarial diseases. The *New Orleans Medical and Surgical Journal* summarized his work on the subject of fevers in 1855. Imbued with the idea that control of the fever itself was essential in the treatment of these diseases, Gorrie carried out many experiments to devise a method for the manufacture of ice, which was scarce in Apalachicola and which, when brought south from New England, sometimes cost a dollar a pound. Eventually he succeeded. The original model of his ice machine, now in the Smithsonian Institution in Washington, comprised essentially a pump with which to compress air in a chamber in which was a container filled with water. After being compressed, the air was permitted to expand rapidly, thereby absorbing heat from the water and so producing artificial ice. Gorrie's ideas were at first ridiculed, and he was unable to obtain financial backing to develop his machine. However, thirty years after he died, there was built in Apalachicola one of the first commercial ice factories in the world. Dr. John Gorrie is recognized today as the father of the artificial ice industry.

While his ideas on the prevention of fevers were not entirely in accord with more recent discoveries, Gorrie advocated the draining and filling of swamps to prevent fevers in the interest of public health. He had observed that persons who slept under nets rarely contracted the fever. Apparently he did not suspect that the effectiveness of the net was due to the simple fact that it kept mosquitoes from biting the person within. To apply

the idea of controlling fever in the treatment of disease, he developed a unique method of ventilating the room by means of an opening in the wall at the floor level instead of using windows and doors. He would suspend from the ceiling of the sickroom a receptacle in which was placed a block of ice, and above it a hood with a pipe passing through the ceiling into the chimney. The ice at the ceiling cooled the air, which, being heavier, descended and passed out of the room through the opening at the floor. This arrangement produced a circulation of cooled air, which passed over the patient. With this method of ventilation in actual service, Gorrie became the father of modern air conditioning as a method for the treatment and prevention of certain diseases.

Dr. Gorrie spent his entire personal fortune in attempting to develop his methods and died without realizing that he would some day be regarded as a great benefactor of mankind. He was also a public servant in other capacities, having been chairman of the council, treasurer, postmaster and mayor of Apalachicola. The state of Florida long since recognized his greatness when it placed his statue in the Hall of Fame in the Capitol in Washington. John Gorrie belongs also in that medical hall of fame which includes such other general practitioners of medicine as Koch, Jenner, McDowell, Sims and Long.

#### HEREDITARY FACTOR IN OBESITY

Of the factors believed to be significant in producing obesity, heredity has received much attention. It is easy to impress on the mind of the layman the belief that normally he has little control over his body weight and that his hereditary tendencies are of prime importance in governing the build which he attains. One often hears of the tendency to remain thin or of the tendency to gain weight. It is also common to hear of the inability either to gain or to lose weight by increasing or decreasing the food intake. This belief that appetite and energy intake were secondary in importance to the hereditary or "tendency" factor in weight regulation early received considerable support from the investigations of Grafe and his associates.<sup>1</sup> These investigators believed that the fasting, resting metabolism is significantly affected by the caloric value of the food previously ingested. According to this hypothesis, normal animals, including man, maintain a constant weight, almost without regard to the energy intake, by alteration of the metabolism in accordance with the caloric value of the food. Obesity becomes, therefore, nothing more than the failure of this alleged metabolism-regulating mechanism to respond normally to the stimulus of food. Furthermore, leanness may then be attributed to an over-response to a normal stimulus. The magnitude of these responses appeared to be related to a "tendency" factor.

1. Taylor, H. M.: John Gorrie: Physician, Scientist, Inventor. *South. M. J.* 28: 1075 (Dec.) 1935.

1. Grafe, E., and Graham, D.: *Ztschr. f. physiol. Chem.* 73: 1, 1911.

Wiley and Newburgh<sup>2</sup> have clearly demonstrated that the hypothesis of Grafe is based on a fallacious analysis of experimental data. In the normal person the body weight is affected by the individual metabolic requirement and by the total intake of energy. When the food ingested provides an amount of energy less than the metabolic requirement, there will be an initial loss of weight and an adjustment of the rate of metabolism to a lower level. If the undernutrition is not too extreme, weight may be maintained after the initial loss. This appears to be an adaptation enabling the organism to prolong life despite the restricted food supply. The ingestion of a quantity of food in which the energy content exceeds the individual metabolic requirements will result in an increase in weight. Although a number of factors may influence the individual metabolic requirements, it seems apparent that the appetite mechanism functions to maintain a balance between the supply of energy and the metabolic demands.

Notwithstanding the experimental demonstration that the relationship existing between the caloric intake and metabolic requirement is of fundamental importance in regulating body weight, it seems likely that heredity indirectly plays more than a coincidental part. The emphasis which should be attributed to this factor, however, remains to be clearly established. Studies of the type reported by Gurney<sup>3</sup> from the University of Buffalo will aid in a statistical analysis of the importance of the hereditary factor in obesity. Seventy-five stout women were studied in the outpatient department of the Buffalo General Hospital with particular reference to three points: (1) the factors associated with the onset of obesity as compared with the same factors occurring in a not stout control group, (2) the incidence of obesity in the parents of the stout group as opposed to that in the parents of the not stout control group, and (3) the body build of the progeny of different matings with special reference to mendelian inheritance of build. Of sixty-three stout women who gave a reliable history of the onset of obesity, pregnancy or a major operative procedure appeared to be the most common factor associated with the initiation of the obese condition. However, in the control group of fifty-five women who were of approximately the same age group and who had approximately the same incidence of pregnancies and operation, obesity did not develop. Further study demonstrated that the incidence of obesity in the parents of the stout group was markedly greater than in the parents of the group of women who were not stout. A study of the progeny of different parents indicated a segregation which was taken as evidence for mendelian inheritance of build. Data of this type would seem to indicate that certain inconsistencies of build in persons subjected to the

same environmental influence may be related to the hereditary factor. In its relation to the more important energy factors already discussed, the observations of Gurney may be interpreted as suggesting that the energy requirement of persons subjected to the same conditions may be modified by a hereditary influence of build. This is to be expected in view of the relationship existing between the surface area of a person and the fasting, resting metabolism.

## Current Comment

### ESTROGENIC HORMONES AND SARCOMA IN MALE MICE

The interesting interrelationships among the estrogenic substances, the carcinogenic chemical compounds and the sterols, and the rôle of estrogenic substances in tumor formation, have been discussed in these columns.<sup>1</sup> Numerous studies have demonstrated unsuspected ramifications of these relationships; an additional aspect of this suggestive story has been revealed in a report from the Yale University School of Medicine.<sup>2</sup> It has been possible to produce sarcoma experimentally at the site of injection of estrogenic substances in five male mice from two different litters of a high tumor rate strain. Each animal was given by subcutaneous injection 10 rat units of theelin daily from sixty-eight to 102 days, followed by weekly injections of 500 international units of keto-estrin benzoate for periods of from twelve to twenty-five weeks. These sarcomas grew rapidly in the original mice and also following implantation into other mice of the same strain. Grafts made in one unrelated strain have failed to grow, although there was growth of grafts in some of the mice of each of two other distantly related strains and of another unrelated strain. Histologic examination of the primary tumors and grafts showed that these were spindle cell sarcomas in a state of active growth. Large multinucleated cells were obtained occasionally. Delicate capillaries were plentiful, and edematous areas occurred in the primary tumors with an associated leukocytic infiltration. There were some areas of necrosis in both the primary tumors and the grafts. The neoplastic tissues showed invasion of the surrounding normal tissues, but no metastases were observed. Although the specific response of the mammary epithelium to estrogenic hormone is now generally recognized, this newly observed development of sarcoma in subcutaneous tissue under the described experimental conditions is striking and suggestive. It seems possible that estrogenic hormone, under as yet ill defined conditions, may have a stimulating effect on mesodermal cells as well as on epithelium, the result being of sufficient extent to cause neoplasms in a manner already observed to be characteristic of the so-called carcinogenic substances.

## Medical Economics

### FREEDOM OF CHOICE OF PHYSICIAN IN INDUSTRIAL MEDICINE

M. S. BLOOM, M.D.,  
BINGHAMTON, N. Y.

For nearly four years a plan of industrial medicine which provides complete freedom of choice of physicians has worked out successfully in Binghamton, N. Y. This plan, referred to widely as the "Spaulding plan," originated with Spaulding Bakeries, Inc., manufacturers of bakery products. It represents an industrial prepayment medical plan offering complete freedom of choice of physicians. Some facts concerning the plan, the philosophy back of its inception, and the procedure by which its principles are achieved, have been the subjects of previous articles published in *THE JOURNAL*.<sup>1</sup>

Since the publication of my last article, experience with the new plan in the business organizations now sponsoring it has been one of continued progress. There has been an increased accumulation of reserve funds, indicating the financial soundness of the basic principles on which it is organized. What is perhaps more important still, there has been no sign of let-down in the splendid spirit of cooperation and enthusiasm on the part alike of physicians, employees and employers. With almost four years of experience in this pioneer project, I am more convinced than ever that the plan is not only practicable, workable and highly desirable but necessarily the mean between the extremes of complete and uncompromising *laissez faire* and an equally complete and uncompromising state medicine.

Dr. Willard J. Denno, general medical director of the Standard Oil Company of New Jersey, writes:

"As you probably know, we have been interested for a long time in the problem of obtaining for the low-salaried groups of this company a moderate priced medical service which would at the same time be of high quality.

"In 1923, we assisted our employees at Baton Rouge in starting a mutual benefit association which has proved extremely successful from the standpoint of the group involved. It has the disadvantage, however, of not permitting free choice of physicians, as this association employed only full-time doctors (surgeons, internists, specialists, etc.) and thus antagonized the local medical profession. I soon came to realize that, if anything constructive was to be accomplished that would be generally acceptable to the medical profession and at the same time provide high grade service for the lower salaried groups, it would be necessary to encourage the free choice of physicians as one of the basic tenets of the plan. The organization that you have evolved meets these requirements and meets them better than any other plan that I have studied. It was for this reason that I arranged for my associate Dr. Schoenleber to visit you and discuss the details of your organization, with the result that we determined to adopt the general principles of your plan. Our company is now offering to its employees the opportunity to organize a mutual benefit association (based on the principles of the Spaulding plan) and the full cooperation of our medical department is at the service of any such groups as may wish to avail themselves of our advice."

Another official of the same company writes that some such project as freedom of choice might "point the direction in which this type of security program should go rather than the state medicine route European countries are following."

The Commission of Medical Economics of Kings County, N. Y., approves the Spaulding plan, and Dr. Lewis A. Koch, chairman of the committee, in a letter makes the following interesting comments: "Our county society is actively engaged in an effort to bring about the transformation of the unacceptable plans now in force in two companies in New York.

We are urging them to revise their plans to conform to the general outline that you have accomplished in Binghamton. I feel that the five counties of greater New York will demand that some plan similar to the Spaulding plan or the Workmen's Compensation Law must be made."

The head of a large chain store corporation writes that he thinks the plan is a "wonderful thing for any organization." The medical director of a large insurance company says: "This plan comes as near reaching the ideal of industrial medicine as any plan that I have heard of. It appears to meet the medical and surgical needs of the group and yet stays away from the various extremely objectionable paternalistic plans advocated and practiced by some large industrial groups."

My point is not to present a pleasing array of testimonials for this type of medical service but simply to take from my miscellaneous correspondence some views that have been spontaneously expressed with no thought of publication. The samples selected are representative, and more or less random, although by no means exhaustive.

Dr. J. L. Kinner, past president of the Chemung County Medical Society, Elmira, N. Y., where one of the divisions of the Spaulding Mutual Benefit Association operates, tells me that he has "taken pains to inquire from other doctors and from employees as to their opinions of the Spaulding plan, and," he continues, "in no single instance have I found an expression of dissatisfaction. I am personally of the opinion that a general application of this plan to industry will do much to solve many of the problems that exist in the care of the sick."

Dr. Charles S. Stevens, adviser of the Elmira Division of Spaulding's, states his experience as follows: "At various times throughout the past two years, I have deliberately talked about the plan with various Elmira physicians and not once have I heard a single complaint against the plan or the way in which it is being operated. Every single individual is more than satisfied with it, and very frequently I have heard the statement from physicians and surgeons that they wished other industrial corporations would adopt a similar proposition."

It may be assumed without elaboration that the employing sponsors approve the plan as advantageous to their organizations. There is a real financial cost involved, of course, but the employers feel that, if they can help to free the minds of their workers from the bothersome thoughts of doctor bills and hospital costs during illness, this cost is productive. There is something more than the economic consideration in the background, for in every instance the organizations sponsoring the plan feel that they are providing a definite service, something ordinarily out of the reach of the rank and file of the average industrial employee. Call it what you will, the fact remains that the employer is doing a genuine service for the individuals on his payroll, for the community and for society.

As indicated, the original venture in freedom of choice was with the Spaulding Bakeries, Inc., at their Binghamton plant. From that plant the services were extended to plants in Elmira, Oneonta and Wilkes-Barre. A division is now in the process of organization at Middletown, N. Y., in the Spaulding plant there. The principles and practices of the plan have also been extended to two other firms in Binghamton—the Agfa Ansco Corporation, manufacturers of cameras and photographic supplies, and Truitt Brothers, shoe manufacturers. In both organizations the plan is working out with splendid success.

Perhaps the feeling in general of the employee toward the plan can best be indicated by quoting from a letter which I received not long ago. It is typical of the reaction I am constantly receiving from workers with whom I come in contact:

"While I was recovering from my recent operation I have had a great deal of time to think about the benefits I have obtained from our mutual benefit association. It would have been practically impossible for me to have had any operation unless I went as a charity patient.

1. Bloom, M. S.: A New Experiment in Industrial Medicine, *J. A. M. A.* 106: 1869 (June 10) 1933; Successful Industrial Group Practice, *ibid.* 103: 1155 (Oct. 13) 1934.

"Two years ago I had an operation and we would be still paying for it if it were not for the mutual benefit association. In the two and a half years that I have been in the association I have paid in about \$30. I have had benefits which would have totaled nearly \$700 or \$800 if I had been forced to pay for them. It would have meant one of two things—first, an enormous bill which would have taken an indefinite time to pay and also have been a burden that we could not have carried with our present earnings, and, second, my going to the hospital as a charity case, which would have meant embarrassment for both my husband and myself.

"For these reasons I cannot see how any one employed where they have a benefit association can afford to be without the protection which the association gives."

Group medicine, without doubt, is more extensively practiced in the Binghamton area than in any other area in this country. There are, according to the local chamber of commerce, 25,926 industrial workers in the district. All but 5,000 of these participate in some form of industrial medicine—represented by contract, freedom of choice, or something in between. There are probably at least 10,000 more persons gainfully employed. So that out of a community of approximately 35,000 employed persons more than half of them are protected by industrial medicine. This fact takes on significance, I believe, as I get to the next point.

The Binghamton City Hospital is one of the hospitals which is used by the members of these medical service plans. Nearly one half of the employed persons work for one large shoe company, which hospitalizes its cases at another institution. The current report of the Binghamton City Hospital indicates that the number of free cases has increased from 35 per cent of all cases in 1927 to 56 per cent in 1935. In 1930 the free operation represented 25 per cent of all cases, and in 1935 48 per cent. The point is, then, that in a community which certainly has done a tremendous amount of work to relieve the problem of medical care still only 44 per cent of the cases entering the leading hospital are paid cases. This in spite of the fact that the area has probably suffered much less from the depression than most industrial areas in this country.

The Broome County Medical Society, in whose jurisdiction the Spaulding plan operates, has gone into the question of prepayment medical insurance by recently adopting a resolution favoring the prepayment plan of medical care. This decision was reached largely on the basis of the successful and satisfactory operation of the Spaulding plan. Here again there will doubtless be still a further vehicle of experimentation in freedom of choice in group medicine as soon as a plan can be worked out in detail. If the medical society can work out a suitable plan, using the experience directly at hand, for the community at large or some segment of it, it would seem that the profession is proceeding in the direction of at least a partially intelligent solution of the dilemma of medical care.

The principles on which modern medicine is founded were given a very satisfactory day in court last summer in the state of New York. The new Workmen's Compensation Law for that state calls for complete freedom of choice on the part of the employee. Group practice of whatever type or kind must begin with freedom of choice if the patient is to be given all that modern medical science is capable of giving, and if the personal doctor-patient relationship is to be retained.

And so it is that progress is being made definitely, along progressive lines, and in the interest of the doctor, the patient and the community.

Getting back to the specific plan, it should be of considerable interest to classify the expenditures made by business organizations operating under the Spaulding plan. We present the classification of expenditures in percentages. These are for physicians, sick relief, hospitalization and dentists. (Dental features are provided by only one of the Spaulding divisions and include only x-ray examinations and extractions.)

These percentages, given in the accompanying table, provide a dependable guide in estimating what the relative expenditures might be under a similar plan, and will help others who have a part in running any organization for medical service.

When a mutual benefit group of this nature is organized the medical profession in the given community is taken into full confidence and given the privilege of accepting or rejecting any or all provisions. The question of arriving at satisfactory fees has never been a difficult one and has always been adjusted to the satisfaction of the community physicians. The local societies have accepted the fee basis of \$100 for major operations. Fees for minor operations follow the general fee tables of the community. Prevailing fees for house and office calls are respected. Specialists whose fees are above the prevailing rates are paid the regular, or general fee by the group, and the difference, if there is one, is borne by the patient.

There is no limit whatever to the amount of money that may be paid to any one physician. Limits would not be practicable under this plan, for absolute freedom of choice is maintained at all times. The amount of work the physician gets depends on his reputation as a doctor, just as it does in regular practice. Our records show, however, interestingly enough, that the work is widely distributed, probably on the natural and normal basis of the general community practice.

Percentages of Expenditures Under the Plan

Firm	Dates	Phys- cians	Sick Relief	Hospi- tals	Den- tists
Spaulding's Binghamton.....	4/1/32- 4/1/33	73.2	10.7	8.2	7.9
	4/1/33- 4/1/34	66.2	12.3	13.8	7.7
	4/1/34- 4/1/35	71.0	11.0	8.2	9.6
Three year average.....		70.1	11.2	10.1	8.4
Elmira.....	1/1/34- 1/1/35	67.7	8.8	23.5	
	1/1/35- 1/1/36	82.0	4.6	13.4	
Two year average.....		74.8	6.7	18.4	
Oneonta.....	11/1/34-11/1/35	73.0	5.2	21.8	
Wilkes-Barre.....	1/1/35- 1/1/36	67.5	3.3	29.2	
Agfa Anseo Corporation.....	4/1/33- 4/1/35	63.8	20.5	15.7	
	4/1/34- 4/1/36	75.8	11.5	12.7	
Two year average.....		69.8	16.0	14.2	
Truitt Brothers.....	5/1/34- 5/1/35	68.1	24.8	7.1	

Although there are no limits to expenditures to any one physician, there are definite, though very liberal, limits set for expenditures for members. For instance, a limit of \$50 is placed for office and house calls for any one member. Hospital costs per member are limited to \$3 per day for any thirty days in a given year. Not more than \$350 total may be expended for any one member during a year. The last limit is set by the state law for organizations not incorporated.

Expenditures for eyeglasses, crutches, splints and the like are paid for by the patient, although the benefit association provides for refractions, consultations, x-ray examinations and laboratory services. The fact that all the limits are liberal is borne out by the condition that very seldom indeed does any one reach the prescribed maximum limits.

The plan is financially sound. A splendid reserve is continuously accumulating to provide against unpredictable epidemics of disease. When it is felt that the reserve is sufficiently large to take care of any risks likely to arise, additional services for members will be incorporated in the plan.

Whatever changes come should fit into the needs and philosophy of the physician, and whatever plans are developed should be in his hands. The physician has complete freedom under the Spaulding plan, the feasibility of which has been proved over a period of four years, and in an adequate number of diversified industries. This plan seems to be an intelligent approach to the needs of employed groups, and, with certain limitations, it should be possible for county medical societies in general to sponsor such a plan for entire communities.

110 Oak Street.

# PROCEEDINGS OF THE KANSAS CITY SESSION

## MINUTES OF THE EIGHTY-SEVENTH ANNUAL SESSION OF THE AMERICAN MEDICAL ASSOCIATION, HELD AT KANSAS CITY, MAY 11-15, 1936

(Concluded from page 1924, volume 106)

### MINUTES OF THE SECTIONS

#### SECTION ON PRACTICE OF MEDICINE

WEDNESDAY, MAY 13—MORNING

The meeting was called to order at 9:05 by the chairman, Dr. William J. Kerr, San Francisco.

Dr. Walter L. Bierring, Des Moines, Iowa, in outlining the organization of the American Board of Internal Medicine, commented as follows: That in accordance with a resolution adopted in 1935, the chairman of the Section on Practice of Medicine appointed a committee consisting of Drs. Reginald Fitz of Boston, Ernest E. Irons of Chicago, John H. Musser of New Orleans and Walter L. Bierring, chairman, to act in conjunction with a committee from the American College of Physicians in the authorization of a certifying board for internists in the organization. This committee met in conjunction with the committee from the American College of Physicians, consisting of Dr. J. A. Bauer of St. Louis; Dr. J. C. Meakins, representing the Canadian medical group; Dr. W. S. Middleton of Wisconsin; Dr. Pepper of Philadelphia, and Dr. G. G. Richards of Salt Lake City. A definite plan of organization has been developed in the form of articles of incorporation which constitute the constitution and by-laws of the American Board of Internal Medicine, which have been approved by the Executive Committee of the Advisory Board for Specialties, the Council on Medical Education and Hospitals and the General Advisory Board for Medical Specialties. Dr. Bierring also informed the section that the American College of Physicians was underwriting the American Board of Internal Medicine until such time as it becomes self supporting.

It was moved by Dr. Bierring, on behalf of the committee, that the Section on Practice of Medicine approve the organization of the American Board of Internal Medicine, which motion was duly seconded.

Dr. James Alexander Miller, New York, president of the American College of Physicians, made some brief remarks, concerning the American Board of Internal Medicine, following which the motion that the Section on Practice of Medicine approve the organization of this board was put to a vote and carried.

Drs. Wallace M. Yater and Laurence S. Otell, Washington, D. C., presented a paper on "Hepatosplenography by Means of Stabilized Thorium Dioxide Sol." Discussed by Dr. Leo G. Rigler, Minneapolis.

Drs. Edward F. Bland, T. Duckett Jones and Paul D. White, Boston, presented a paper on "The Regression and Disappearance of the Signs of Rheumatic Heart Disease." Discussed by Drs. Fred M. Smith, Iowa City; P. T. Bohan, Kansas City, Mo.; William J. Kerr, San Francisco, and T. Duckett Jones, Boston.

Dr. Walter L. Bierring, Past President of the American Medical Association, introduced the Frank Billings lecturer for this year, Dr. George Blumer, New Haven, Conn., who read a paper on "Pericarditis Epistenocardica."

Drs. A. V. Hardy, Baltimore; C. F. Jordan, Des Moines, Iowa, and I. H. Borts, Iowa City, presented a paper on "Undulant Fever: Further Clinical and Epidemiologic Observations in Iowa." Discussed by Drs. Fred E. Angle, Kansas City, Kan.; Walter L. Bierring, Des Moines, Iowa; William J. Kerr, San Francisco, and A. V. Hardy, Baltimore.

Dr. H. A. Reimann, Minneapolis, read a paper on "Habitual Hyperthermia." Discussed by Drs. A. C. Ernstene, Cleveland, and Russell M. Wilder, Rochester, Minn.

Dr. Alvan L. Barach, New York, read a paper on "Practical Therapeutic Aspects of Helium Therapy." Discussed by Drs. Francis M. Rackemann, Boston; C. K. Maytum, Rochester, Minn.; John D. Kernan, New York; Frank H. Lahey, Boston; William J. Kerr, San Francisco, and Alvan L. Barach, New York.

THURSDAY, MAY 14—MORNING

A joint meeting was held with the Section on Pharmacology and Therapeutics.

Dr. Soma Weiss, Boston, read a paper on "The Clinical Use and Dangers of Hypnotics." Discussed by Drs. Chauncey D. Leake, San Francisco, and Soma Weiss, Boston.

Dr. William J. Kerr, San Francisco, read the chairman's address, entitled "The Common Cold."

Dr. Joseph M. Hayman Jr., Cleveland, read a paper on "The Clinical Use of Diuretics."

Dr. Stafford L. Warren, Rochester, N. Y., read a paper on "Clinical Evaluation of Fever Therapy," which was followed by questions from the floor and answered by Dr. Warren.

Dr. W. M. James, Panama, C. Z., read a paper on "Notes on Treatment of Histolytica Infection in Man."

FRIDAY, MAY 15—MORNING

The following officers were elected: chairman, Dr. John H. Musser, New Orleans; vice chairman, Dr. Ralph H. Major, Kansas City, Mo.; secretary, Dr. Joseph T. Warren, Cleveland; executive committee: Dr. George R. Minot, Boston; Dr. William J. Kerr, San Francisco; Dr. John H. Musser, New Orleans; delegate, Dr. J. E. Paullin, Atlanta, Ga.; alternate, Dr. Ernest E. Irons, Chicago.

Drs. Norman Jolliffe and C. N. Colbert, New York, presented a paper on "The Etiology of Polyneuritis in the Alcoholic Addict."

Dr. M. A. Blankenhorn, Cincinnati, read a paper on "Oral Complications of Chronic Alcoholism: Significance, Diagnosis and Treatment."

These two papers were discussed by Drs. H. B. Mulholland, University, Va.; Tom Spies, Cincinnati; Norman Jolliffe, New York, and M. A. Blankenhorn, Cincinnati.

Dr. Stacy R. Mettier, San Francisco, read a paper on "Classification and Treatment of the Hemorrhagic States, with Special Reference to the Value of Roentgen Irradiation of the Spleen and Essential Thrombocytopenic Purpura Hemorrhagica." Discussed by Drs. E. B. Reed, Lincoln, Neb., and Stacy R. Mettier, San Francisco.

Drs. R. A. Woodbury, W. F. Hamilton and H. T. Harper Jr., Augusta, Ga., presented a paper on "Effect of Coughing, Straining, Forced Breathing on Arterial and Intrathoracic Pressure in Man." Discussed by Drs. Ralph H. Major, Kansas City, Mo., and R. A. Woodbury, Augusta, Ga.

Drs. John C. Sharpe and Richard H. Young, Omaha, presented a paper on "Von Recklinghausen's Neurofibromatosis: Unusual Clinical Manifestations in Sixteen Cases." Discussed by Drs. W. M. Ketcham, Kansas City, Mo.; J. J. Eller, New York, and Richard H. Young, Omaha.

Drs. R. H. Freyberg, R. L. Grant and M. A. Robb, Ann Arbor, Mich., presented a paper on "Hypoparathyroidism: The Treatment of Chronic Cases and an Explanation of 'Refractiveness' to Parathyroid Extract." Discussed by Drs. W. M. Ketcham, Kansas City, Mo.; William J. Kerr, San Francisco, and R. H. Freyberg, Ann Arbor, Mich.

SECTION ON SURGERY, GENERAL  
AND ABDOMINAL

WEDNESDAY, MAY 13—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. Howard M. Clute, Boston.

Dr. Herbert L. Johnson, Boston, read a paper on "Peritoneal Immunization." Discussed by Drs. Bernhard Steinberg, Toledo, Ohio; H. M. Trusler, Indianapolis; W. T. Coughlin, St. Louis, and Herbert L. Johnson, Boston.

Dr. Leon Goldman, San Francisco, read a paper on "Gross Hemorrhage in Peptic Ulcer: Its Morbidity, Mortality and Treatment." Discussed by Drs. Samuel L. Ledbetter Jr., Birmingham, Ala.; J. William Hinton, New York, and Leon Goldman, San Francisco.

Drs. Donald Guthrie, Sayre, Pa., and Robert F. Sharer, Oak Park, Ill., presented a paper on "Permanence of Cure Following Ruptured Duodenal Ulcers." Discussed by Drs. Harry Kerr, Washington, D. C.; Edwin G. Ramsdell, White Plains, N. Y.; W. T. Coughlin, St. Louis, and Robert F. Sharer, Oak Park, Ill.

Drs. Alton Ochsner and Ambrose H. Storck, New Orleans, presented a paper on "Treatment of Mechanical Ileus by Intestinal 'stripping': A Clinical and Experimental Study." Discussed by Drs. Willis D. Gatch, Indianapolis; Owen H. Wangenstein, Minneapolis, and Alton Ochsner, New Orleans.

Drs. R. Russell Best and N. Frederick Hicken, Omaha, presented a paper on "Cholangiographic Demonstration of Biliary Dyssynergia and Other Obstructive Lesions of the Gallbladder and Bile Ducts." Discussed by Drs. Frank H. Lahey, Boston, and Waltman Walters, Rochester, Minn.

Dr. Hugh H. Young, Baltimore, read a paper on "Imperforate Anus: Bowel Opening into Urethra: Hypospadias; Presentation of New Plastic Methods." Discussed by Dr. John R. Caulk, St. Louis.

THURSDAY, MAY 14—MORNING

The chairman appointed Dr. Donald Guthrie, Sayre, Pa., to preside in the absence of the vice chairman, Dr. William F. Rienhoff, Baltimore.

Drs. Nelson W. Cornell and Alice R. Bernheim, New York, presented a paper on "The Apparent Influence of Hydrochloric Acid on Bone Growth in Fractures." Discussed by Drs. Harry Shay, Philadelphia; Mandell Shimberg, Leavenworth, Kan., and Nelson W. Cornell, New York.

Dr. Willard Bartlett Jr., St. Louis, read a paper on "Dynamic Tests in Thyrotoxicosis." Discussed by Drs. Evarts A. Graham, St. Louis; John Lucius McGehee, Memphis, Tenn., and Willard Bartlett Jr., St. Louis.

Dr. Roy D. McClure, Detroit, read a paper on "Hypoparathyroidism Following Operations for Hyperparathyroidism Due to Adenoma." Discussed by Drs. Frank H. Lahey, Boston; Brien T. King, Seattle, and Roy McClure, Detroit.

Dr. Howard M. Clute, Boston, read the chairman's address, entitled "The Problem of Cancer of the Pancreas."

Dr. Winchell McK. Craig, Rochester, Minn., read a paper on "Tumors of the Spinal Cord and Their Relation to Medicine and Surgery." Discussed by Drs. Ernest Sachs, St. Louis, and Winchell McK. Craig, Rochester, Minn.

Dr. Richard B. Cattell, Boston, read a paper on "Improvements in the Treatment of Cancer of the Rectum." Discussed by Drs. Fred W. Rankin, Lexington, Ky.; William D. Haggard, Nashville, Tenn., and Richard B. Cattell, Boston.

FRIDAY, MAY 15—MORNING

The following officers were elected: chairman, Dr. Robert S. Dinsmore Jr., Cleveland; vice chairman, Dr. Alton Ochsner, New Orleans.

Dr. Fred W. Rankin, Lexington, Ky., read the following report and moved that the section approve the action of its committee as expressed in the recommendations of the National Committee for the elevation of standards of practice of surgery and empower its chairman to appoint three members from this section to serve on the American Board of Surgery, and that the section recommend cooperation with the proposed joint council, which motion was seconded and carried:

At the Atlantic City meeting of the American Medical Association in June 1935 this section appointed a committee of five to cooperate with a committee appointed by the American Surgical Association to consider the elevation of standards of practice of surgery and to increase the hospital facilities for the training of young surgeons.

Your committee met with the other committees at the headquarters of the American College of Surgeons in Chicago, Oct. 23, 1935, under the chairmanship of Dr. Evarts Graham. A committee from the executive committee of the American College of Surgeons, consisting of Drs. Crile, Squire, Harvey, Abell and Crowell joined in this meeting. After prolonged discussion, the representatives of the American College of Surgeons agreed to cooperate in this movement to the extent of appointing six members to create a national committee of twenty-four to discuss ways and means of forming an organization for qualifying surgeons.

At a subsequent meeting February 15 and 16 this committee of twenty-four members met in Chicago. Representation was as follows: American Surgical Association, six; Section on Surgery, General and Abdominal, of the American Medical Association, six; Southern Surgical Association, two; Western Surgical Association, two; Pacific Surgical Association, two. This committee was divided into two committees: (1) to plan for the organization of an American Board of Surgery, and (2) to plan for increasing opportunities for training surgeons. These two committees submitted their reports to the joint committee and the reports were unanimously accepted.

The chairman of the National Committee was authorized to present a plan for creation of an American Board of Surgery to the Executive Committee of the Advisory Board for Medical Specialties. The plan was presented and approved by that body.

This plan proposes that the board consist of thirteen members, allocated as follows:

The American Surgical Association.....	3
The Section on Surgery, General and Abdominal.....	3
The American College of Surgeons.....	3
The Southern Surgical Association.....	1
The Western Surgical Association.....	1
The Pacific Coast Surgical Association.....	1
The New England Surgical Society.....	1

13

It is proposed that a group of founders be selected to be qualified without examination consisting of the members of the above-mentioned societies eligible when the board begins to function and, in addition, within the first two years after the board begins to function, those who have limited their practice to surgery for fifteen years may make direct application to the board and with its approval be certified without examination.

Other candidates will be approved by the board after certain requirements have been fulfilled, one of which concerns special training.

For increasing the facilities of training of surgeons, it is recommended that the American College of Surgeons and the American Medical Association be asked to form a joint council to organize and carry out a program for the training of surgeons in proper qualified hospitals, setting up such standards as will meet the requirements of the proposed American Board of Surgery. The American Surgical Association approved the recommendations of its committee as to the formation of an American board and the recommendations of the joint council.

The Pacific Coast Surgical Association and the Executive Committee of the New England Surgical Society have approved in principle the recommendations which the National Committee has made. The American College of Surgeons has approved the recommendations to form a joint council.

It was regularly moved, seconded and carried that the chairman be authorized to appoint three members to cooperate with the National Board of Anesthetists and the Society of Regional

Anesthetists in establishing a national board for certification in anesthesia and to report to the section at the meeting in 1937.

Dr. Frederick A. Collier, Ann Arbor, Mich., read a paper on "The Maintenance of Normal Water Exchange with Intravenous Fluids." Discussed by Drs. Thomas G. Orr, Kansas City, Mo., and Walter G. Maddock, Ann Arbor, Mich.

Dr. Daniel C. Elkin, Atlanta, Ga., read a paper on "Injuries of the Thoracic Viscera." Discussed by Drs. Frederick Christopher, Evanston, Ill., and L. Wallace Frank, Louisville, Ky.

Dr. Clarence E. Bird, Louisville, Ky., read a paper on "The Treatment of Large Pulmonary Abscesses: Report of Ten Cases." Discussed by Drs. Alfred Blalock, Nashville, Tenn.; P. B. Salatch, New Orleans, and Clarence E. Bird, Louisville, Ky.

Dr. George L. Stivers, Fall River, Mass., read a paper on "Indications and Limitations of Intrapleural Pneumolysis in Closing Pulmonary Tuberculous Cavitation." Discussed by Drs. Frank B. Berry, New York; Victor Strong Randolph, Phoenix, Ariz., and George L. Stivers, Fall River, Mass.

Dr. Earl C. Padgett, Kansas City, Mo., read a paper on "Skin Grafting After Extensive Epithelial Loss, with Special Reference to That Following Burns." Discussed by Drs. Gordon B. New, Rochester, Minn.; James B. Brown, St. Louis, and Earl C. Padgett, Kansas City, Mo.

Dr. Vilray Papin Blair, St. Louis, read a paper on "Plantar Warts, Flaps and Grafts." Discussed by Drs. Ellis Fischel, St. Louis; Joseph J. Eller, New York, and Vilray Papin Blair, St. Louis.

## SECTION ON OBSTETRICS, GYNECOLOGY AND ABDOMINAL SURGERY

WEDNESDAY, MAY 13—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr. Lyle G. McNeile, Los Angeles.

Dr. Frank H. Bethell, Ann Arbor, Mich., read a paper on "The Blood in Normal Pregnancy." Discussed by Drs. R. B. Schutz, Kansas City, Mo.; Adolph Sachs, Omaha, and Frank H. Bethell, Ann Arbor, Mich.

Dr. Louis Rudolph, Chicago, read a paper on "Constriction Ring Dystocia." Discussed by Drs. M. P. Rucker, Richmond, Va.; W. T. Pride, Memphis, Tenn.; Percy B. Russell Jr., Memphis, Tenn., and Louis Rudolph, Chicago.

Drs. Fred L. Adair, Chicago, and A. B. Hunt, Rochester, Minn., presented a paper on "Vascular Collapse in Toxic Patients." Discussed by Drs. Ralph R. Wilson, Kansas City, Mo.; Robert D. Mussey, Rochester, Minn., and Fred L. Adair, Chicago.

Drs. Edward A. Schumann and Adrian W. Voegelin, Philadelphia, presented a paper on "Chorionepithelioma in Philadelphia." Discussed by Drs. P. F. Schneider, Evanston, Ill.; John Rock, Brookline, Mass.; William T. Black, Memphis, Tenn., and Edward A. Schumann, Philadelphia.

Dr. Lewis C. Scheffey, Philadelphia, read a paper on "Carcinoma of the Cervical Stump." Discussed by Drs. J. P. Pratt, Detroit; Henry Schmitz, Chicago; R. Q. Rowse, Sioux City, Iowa, and Lewis C. Scheffey, Philadelphia.

Dr. David R. Murphey Jr., Tampa, Fla., read a paper on "The Treatment of Carcinoma of the Cervix by the Combined Use of Relatively Small Amounts of Radium and High Voltage Roentgen Rays." Discussed by Drs. Fred J. Taussig, St. Louis, and David R. Murphey Jr., Tampa, Fla.

In the absence of Dr. James R. McCord, Atlanta, Ga., Dr. Jennings C. Litzenberg, Minneapolis, was appointed a member of the executive committee by the chairman.

THURSDAY, MAY 14—AFTERNOON

The following papers were read as a symposium on "Obstetric Analgesia":

Drs. Otto S. Krebs, George J. L. Wulff and Helman C. Wassermann, St. Louis: "Scopolamine-Morphine Seminars with Modifications."

Drs. Charles E. Galloway, Robert M. Grier and Robert Blessing, Evanston, Ill.: "Three Years' Experience with Pentobarbital-Sodium and Scopolamine in Obstetrics at the Evanston Hospital."

Drs. Howard F. Kane and George B. Roth, Washington, D. C.: "Relief of Labor Pains by the Use of Paraldehyde and Benzyl Alcohol."

Dr. Gertrude Nielsen, Oklahoma City: "Analgesia in Labor Considered from the Points of View of Medicine and Psychology."

These four papers were discussed by Drs. Buford G. Hamilton, Kansas City, Mo.; Joseph B. De Lee, Chicago; J. L. Baer, Chicago; Rudolph W. Holmes, Chicago; Nicholas J. Eastman, Baltimore; George J. L. Wulff, St. Louis; Frederick V. Emmert, St. Louis; Percy B. Russell Jr., Memphis, Tenn.; S. Kendig Wallace, Baltimore; Otto S. Krebs, St. Louis; Robert M. Grier, Evanston, Ill.; Howard F. Kane, Washington, D. C., and Gertrude Nielsen, Oklahoma City.

Dr. Robert D. Mussey, Rochester, Minn., read the report of the Committee on Maternal Welfare, with the statement that the resolution contained therein would be acted on at the session on Friday:

Your Committee on Maternal Welfare is aware that you are not unfamiliar with the frequently quoted statistics on maternal mortality in this country which show approximately six maternal deaths per thousand live births. Comparison of statistical records of maternal mortality in the United States with those of other countries may lead to erroneous conclusions because of lack of a common basis or measuring stick for the collection of data. In this report we are not concerned with the records of other countries but rather with the necessity of continued effort in this country toward reducing the incidence of preventable obstetric morbidity and mortality.

Since the publication in 1906 by the United States Census Bureau of maternal and infant mortality statistics for the first five years in this century, there has been increasingly coordinated effort to lower maternal and infant mortality. Time does not permit mention of the admirable and time-consuming effort of many local and national organizations which produced a country-wide interest in maternal welfare and which led to the incorporation of the American Committee on Maternal Welfare in April 1934.

In the chairman's address before the meeting of the Committee on Maternal Welfare held at Atlantic City in June 1935, Dr. Fred L. Adair, Chicago, restated the object of the committee. In brief this is as follows:

The object of the American Committee on Maternal Welfare is to promote the interest of the medical profession in cooperation with public and private agencies for the improvement of maternal care and for the prevention of conditions which menace the life and safety of the mother and her offspring during pregnancy and labor and after confinement.

The program as outlined embraced:

1. Education of the public in the principles and practices of health and in the value of efficient antepartum and obstetric care.

2. Improvement and generalization of the standards and methods of training physicians, nurses and others dealing with problems of maternity.

3. The study and the promotion of study of the problems involved in maternal and infant health.

4. The publication and circularization of publications, especially those concerned with this program.

Since incorporation, various organizations in addition to those previously enumerated have been invited to identify themselves officially with this committee and to appoint a representative from their organization to represent it at the meeting. The organizations which are now represented are the American Association of Obstetricians, Gynecologists and Abdominal Surgeons, the American Child Health Association, the American College of Surgeons, the American Gynecological Society, the American Hospital Association, the Section on Obstetrics, Gynecology and Abdominal Surgery of the American Medical

Association, the American Public Health Association, the Central Association of Obstetricians and Gynecologists, the Chicago Maternity Center, the Children's Bureau, U. S. Department of Labor, the Maternity Center Association of New York, the National Organization of Public Health Nursing, the Pacific Coast Society of Obstetrics and Gynecology and the Southern Medical Association.

The committee has sponsored the publication of pamphlets for physicians on Standards of Prenatal Care, on Intranatal or Delivery Care and on The Management of Preeclamptic Toxemia and Eclampsia, and a pamphlet on Standards of Post-natal Care is soon to be published. Believing that there should be a uniform standard for febrile maternal morbidity, the committee has defined it as a fever of 100.4 F. (38 C.) on any two of the first ten days post partum, exclusive of the first twenty-four hours. The temperature should be taken by mouth by the standard technic at least four times daily.

Since its incorporation, the committee has attempted to stimulate the formation of state committees on maternal welfare and their work is now in active progress. Some states already had committees functioning in this capacity, but most of them had not. One of two plans of procedure has been followed in the formation of these state committees. The first contemplated official action by the state medical societies in the formation of such a committee with the thought that each state committee would guide and direct the formation of local committees in each of the county or district societies of its state. This plan was preferred because it was felt that a maternal welfare program would in this way become an official part of the activities of the various state and local medical societies. In the states in which this plan does not appear to be feasible, the national committee has endeavored to secure the active interest of members of the medical profession in leading the activities in their state and in securing the appointment of the necessary local committees throughout that state. The national committee has felt that it should not in any way attempt to dictate the activities of these various committees. It does sincerely believe that such activities on the part of obstetricians and general practitioners are not only advisable but essential for the welfare of both the mother and her infant, on whom the future of the community rests.

Several obstetric and gynecologic organizations are considering the possibility of holding a national congress of obstetrics and gynecology in 1938 or 1939. This subject was brought to the attention of your committee by the American Committee on Maternal Welfare, which favors and is willing to sponsor and promote a National Congress of Obstetrics and Gynecology, if the various organizations interested in these specialties favor such a meeting. Your committee believes that this proposed congress would develop a community of interest and thought in obstetrics and gynecology which would greatly enhance the knowledge of these subjects. Therefore, this committee wishes to present to the Section of Obstetrics, Gynecology and Abdominal Surgery of the American Medical Association the following resolution:

*Resolved*, That the Section on Obstetrics, Gynecology and Abdominal Surgery of the American Medical Association favors and will participate in the plan of holding a National Congress of Obstetrics and Gynecology in 1938 or 1939, provided this congress is participated in by other representative groups of these specialties and that the promotion and arrangements for this congress be undertaken by a national organization such as the American Committee on Maternal Welfare.

Pertinent to this report is a résumé of the provisions relating to maternal welfare in the Social Security Act adopted by Congress and approved by the President on Aug. 14, 1935. Provisions of the act relating to maternal and child welfare are described under item V, "Grants to States for Maternal and Child Welfare." The purpose of federal grants in brief is to enable and assist each state to extend and improve, as far as is practicable under conditions in such state, services for promoting the health of mothers and children, especially in rural areas and in areas suffering from economic distress.

The federal administration of this part of the act is under the immediate direction of the Maternal and Child Health Division of the Children's Bureau, headed by a physician and receiving general supervision from the assistant chief of the Children's Bureau, who is also a physician.

Before any state plan is approved, certain requirements must have been accepted. Among the seven legal requirements for state plans are the following that directly affect the medical profession:

Administration of the plan or supervision of administration of the plan by the state health agency (which in every state is headed by a physician).

Extension and improvement of local maternal and child health services.

Cooperation of demonstration services in needy areas and among groups in special need.

The Advisory Committee of the Children's Bureau on maternal and child welfare services under the Social Security Act included the following obstetricians: Fred L. Adair, Chicago; Robert L. De Normandie, Boston; George W. Kosmak, New York; Lyle G. McNeile, Los Angeles; Everett D. Plass, Iowa City; Philip Williams, Philadelphia, and James R. McCord, Atlanta, Ga.

The advice and suggestions of the advisory committees have in large part formed the basis for the acceptance by the Children's Bureau of plans of the states, which have conformed to the act and are now carrying out the program.

These advisory committees made the following suggestions with respect to state programs for maternal and child health at their meetings in December 1935:

1. That a division of maternal and child health, with a physician for director, be established under the state department of health in each state. (This has been done by every state whose plan has been approved—forty-one approved state plans on April 20, 1936.)

2. That additional state medical staff for consultation and advisory service should consist of full time or part time physicians with training and experience in either maternal or child health work, preferably both.

3. That there be regional advisers to professional groups in the fields of pediatrics, obstetrics and dentistry.

4. That the maternal and child health services by local or other qualified physicians should be arranged for jointly by the local health department and the local medical association with the advice of the director of the state division of maternal and child health.

5. That as far as possible the maternal and child health work in any given area should be carried by local and qualified physicians and, where such are not available, that other arrangements be made in local maternal and child health centers.

6. That medical men taking part in the program should be paid for their services.

7. That there should be cooperation of local and county medical organizations in the educational programs (local and state) to be carried out for professional and lay groups.

The state law under which the program arranged by the Minnesota Department of Health is being conducted may be cited as an example of what may be done under the provision of this act: "The Division of Child Hygiene of the Minnesota Department of Health is limited by state law to a program of an educational nature which automatically eliminates from the work of the division all activities which aim at clinical supervision and treatment or with giving material aid of any kind."

Dr. Lyle G. McNeile, Los Angeles, read the chairman's address, entitled "Trends in American Obstetrics During the First Third of This Century."

Drs. James R. Reinberger and Percy B. Russell Jr., Memphis, Tenn., presented a paper on "The Conservative Treatment of Abortion." Discussed by Drs. J. C. Litzenberg, Minneapolis; Thomas K. Brown, St. Louis; Channing W. Barrett, Chicago; Rudolph W. Holmes, Chicago; W. T. Pride, Memphis, Tenn.; Joseph B. De Lee, Chicago; Lyle G. McNeile, Los Angeles, and James R. Reinberger, Memphis, Tenn.

#### FRIDAY, MAY 15—AFTERNOON

It was regularly moved, seconded and carried that the following resolution be adopted:

*Resolved*, That the Section on Obstetrics, Gynecology and Abdominal Surgery of the American Medical Association favors and will participate in the plan of holding a National Congress of Obstetrics and Gynecology

in 1938 or 1939, provided this congress is participated in by other representative groups of these specialties and that the promotion and arrangements for this congress be undertaken by a national organization such as the American Committee on Maternal Welfare.

The secretary read the report of the executive committee, as follows:

The Committee met in the Municipal Auditorium May 13, 1936, at 5 o'clock. Present: Lyle G. McNeile, Los Angeles; Joseph B. De Lee, Chicago, and J. C. Litzenberg, Minneapolis, acting in place of J. R. McCord, Atlanta, Ga., and the secretary.

The committee agreed to nominate Dr. Fred J. Taussig, St. Louis, to the American College of Surgeons as a candidate for the board of governors of the college.

The committee considered the advisability of asking the House of Delegates to change the name of the section from the Section on Obstetrics, Gynecology and Abdominal Surgery to Section on Obstetrics and Gynecology, and instructed the secretary to prepare a resolution for presentation at this meeting. The resolution offered reads as follows:

WHEREAS, The Council on Medical Education and Hospitals has recently recognized Obstetrics and Gynecology as a specialty, and

WHEREAS, The Scientific Assembly provides adequately for the discussion of problems of abdominal surgery within the Section on Surgery; therefore be it

Resolved, That the Section on Obstetrics, Gynecology and Abdominal Surgery request the House of Delegates to change the name of the section to the Section on Obstetrics and Gynecology, and further be it

Resolved, That the Section on Obstetrics, Gynecology and Abdominal Surgery instruct its delegate to present this resolution to the House of Delegates at its regular meeting in 1937.

The Chairman, Dr. Lyle G. McNeile, announced appointment of the following Committee on Maternal Welfare: Dr. James R. Miller, Hartford, Conn.; Dr. Robert D. Mussey, Rochester, Minn., and Dr. William Benbow Thompson, Los Angeles.

It was regularly moved, seconded and carried that the resolution to change the name of the section to the Section on Obstetrics and Gynecology be adopted.

It was regularly moved, seconded and carried that the nomination of Dr. Fred J. Taussig, St. Louis, to the American College of Surgeons as a candidate for the board of governors of the college be confirmed.

The following officers were elected: chairman, Dr. M. Pierce Rucker, Richmond, Va.; vice chairman, Dr. Buford G. Hamilton, Kansas City, Mo.; secretary, Dr. Everett D. Plass, Iowa City, continued in office; delegate, Dr. George Gray Ward, New York; alternate, Dr. Jean P. Pratt, Detroit.

On motion made by Dr. H. C. Hesseltine, Chicago, and seconded, it was voted that the secretary express the appreciation of the members of the section to the Kansas City Society of Obstetrics and Gynecology for their gracious and exceptional courtesies and hospitalities.

Drs. John C. Burch, G. S. McClellan and Claud D. Johnson, Nashville, Tenn., presented a paper on "The Diagnosis and Classification of Menstrual Disturbances." Discussed by Drs. J. P. Pratt, Detroit; E. C. Hamblen, Durham, N. C., and John C. Burch, Nashville, Tenn.

Drs. Lawrence R. Wharton and Erle Henriksen, Baltimore, presented a paper on "The Operative Observations in Periodic Intermenstrual Pain." Discussed by Drs. J. P. Greenhill, Chicago; J. M. Singleton, Kansas City, Mo.; Cyrus W. Anderson, Denver, and Lawrence R. Wharton, Baltimore.

Drs. Preston T. Brown, Phoenix, Ariz., and Erwin von Graff, Des Moines, Iowa, presented a paper on "The Diagnosis of Ectopic Pregnancy." Discussed by Drs. Theodore H. Aschmann, Kansas City, Mo.; Walter T. Dannreuther, New York, and Erwin von Graff, Des Moines, Iowa.

Dr. William Benbow Thompson, Los Angeles, read a paper on "Cesarean Section in Los Angeles County." Discussed by Drs. Rudolph W. Holmes, Chicago; H. C. Hesseltine, Chicago; J. P. Greenhill, Chicago, and William Benbow Thompson, Los Angeles.

Dr. Howard F. West, Los Angeles, read a paper on "Diabetes and Pregnancy." Discussed by Drs. William F. Mengert,

Iowa City; Ralph H. Major, Kansas City, Mo., and Howard F. West, Los Angeles.

Dr. Julius Jensen, St. Louis, read a paper on "Heart Disease and Pregnancy." Discussed by Drs. L. A. Calkins, Kansas City, Mo.; Ralph H. Luikart, Omaha, and Julius Jensen, St. Louis.

## SECTION ON OPHTHALMOLOGY

WEDNESDAY, MAY 13—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. John Green, St. Louis.

Dr. John Green, St. Louis, read the chairman's address.

Drs. C. S. O'Brien and A. E. Braley, Iowa City, presented a paper on "Tumors of the Eyelids: A Clinical and Pathologic Study." Discussed by Drs. Arnold Knapp, New York; Algernon B. Reese, New York, and C. S. O'Brien, Iowa City.

Dr. William L. Benedict, Rochester, Minn., read a paper on "Adenocarcinoma of the Orbit." Discussed by Drs. Martin Cohen, New York; Walter E. Camp, Minneapolis, and Arnold Knapp, New York.

Dr. Alfred Cowan, Philadelphia, read a paper on "Causes of Blindness in Pennsylvania, from the Medical and Social Aspects." Discussed by Drs. E. V. L. Brown, Chicago; William H. Crisp, Denver; Conrad Berens, New York, and Alfred Cowan, Philadelphia.

Dr. Edward Jackson, Denver, read a paper on "The True Importance of Aniseikonia." Discussed by Drs. Adelbert Ames, Hanover, N. H.; Walter B. Lancaster, Boston; Alfred Bielschowsky, Hanover, N. H.; Conrad Berens, New York; William F. Hardy, St. Louis; Otto Barkan, San Francisco, and Edward Jackson, Denver.

Dr. Warren D. Horner, San Francisco, read a paper on "Cataracts Following Dinitrophenol Treatment for Obesity." Discussed by Drs. Arthur J. Bedell, Albany, N. Y.; Albert D. Frost, Columbus, Ohio; Earl Whedon, Sheridan, Wyo.; Charles Lukens, Toledo, Ohio; Thurber Le Win, Buffalo; Otto Barkan, San Francisco, and Warren D. Horner, San Francisco.

THURSDAY, MAY 14—MORNING

Dr. Albert C. Snell, Rochester, N. Y., read a paper on "A Statistical Study of Functional Muscle Tests in Axial Myopia." Discussed by Drs. Bennett Y. Alvis, St. Louis; Thomas D. Allen, Chicago; Alfred Bielschowsky, Hanover, N. H., and Albert C. Snell, Rochester, N. Y.

The chairman, Dr. John Green, St. Louis, called for an executive session to consider a resolution.

It was moved by Dr. Arthur J. Bedell, Albany, N. Y., duly seconded and carried, that the following resolution be presented to the House of Delegates Thursday afternoon:

WHEREAS, At the 1934 session of the American Medical Association a resolution emanating from this section was approved by the House of Delegates whereby we registered our disapproval of the employment of optometrists by hospitals; and

WHEREAS, At the Atlantic City session of this section we presented a resolution to the House of Delegates of the American Medical Association which in substance stated that we were opposed to the association of our members and those of the optical trade; and

WHEREAS, This resolution was adopted by the House of Delegates; and

WHEREAS, There are attempts to force some ophthalmologists to instruct students of optometry; and

WHEREAS, We believe this unwise, unethical and inadvisable; therefore, be it

Resolved, That we, the Section on Ophthalmology, instruct our delegate to the House of Delegates to present this resolution as an expression of our views with the hope that this action will be officially approved and given wide publicity through the pages of THE JOURNAL.

The executive session was terminated on motion, duly seconded and carried.

Dr. Webb W. Weeks, New York, read a paper on "Critical Analysis of Glaucoma Operations."

Dr. John M. Wheeler, New York, read a paper on "Iridectomy with Cyclodialysis for Reduction of Ocular Tension."

These two papers were discussed by Drs. Harry S. Gradle, Chicago; Philip D. O'Connor, Chicago; John O. McReynolds, Dallas, Texas; Frank E. Burch, St. Paul; Otto Barkan, San

Francisco; Sanford Gifford, Chicago; Warren D. Horner, San Francisco; Webb W. Weeks, New York, and John M. Wheeler, New York.

Dr. Nathan K. Lazar, Chicago, read a paper on "Early Eye Complications in Meningococcic Meningitis." Discussed by Drs. Archibald L. Hoyne, Chicago; Parker Heath, Detroit; Henry C. Haden, Houston, Texas; Albert H. Mann, Texarkana, Texas, and Nathan K. Lazar, Chicago.

At the Demonstration Session the following were shown:  
Dr. Clifford B. Walker, Los Angeles, presented new methods in galvanic and diathermic treatment of retinal detachment.

Dr. Grady E. Clay, Atlanta, Ga., presented grafts from the prepuce and labia minora for the conjunctiva and restoration of the socket.

Dr. Otto Barkan, San Francisco, presented an operation for chronic primary glaucoma and for opening Schlemm's canal under direct vision using a contact glass.

Dr. Everett C. Moulton, Fort Smith, Ark., presented a case of bilateral anterior lenticonus.

Dr. Walter S. Atkinson, Watertown, N. Y., presented a retrobulbar injection within the muscular cone or cone injection.

Dr. Charles N. Spratt, Minneapolis, presented the use of Callahan tubes in the treatment of lacrimal stenosis and chronic dacryocystitis.

Dr. Walter B. Lancaster, Boston, presented a magnet.

Dr. Leo Loeb Mayer, Chicago, presented a neon flash illuminated perimeter.

Dr. William H. Luedde, St. Louis, presented a transparent exophthalmometer.

Dr. T. D. Allen, Chicago, presented a simple cone for tangent screen.

Dr. Conrad Berens, New York, presented a lens for patients with detachment of the retina, and a retractor to be used in operations for detachment of the retina.

Dr. Parker Heath, Detroit, presented a set of instruments for lid treatment.

FRIDAY, MAY 15—MORNING  
*Executive Session*

Dr. Harry S. Gradle, Chicago, presented the report of the Committee on Compensation Tables. The report was adopted and the committee continued.

Dr. Edward Jackson, Denver, presented the report of the American Committee on Optics and Visual Physiology. The report was accepted.

The report of the Committee on the Knapp Testimonial Fund was presented by the treasurer, Dr. Parker Heath, Detroit. The report was accepted.

For the Committee on Awarding the Knapp Medal, Dr. William E. Shahan, St. Louis, reported that no award would be made this year.

The report of the Committee on the American Board of Ophthalmology was read by Dr. John Green, St. Louis. The report was accepted.

The report of Dr. Jonas S. Friedenwald, Baltimore, for the Committee on National Museum of Ophthalmic Pathology was read by Dr. Parker Heath, Detroit. The report was accepted.

The report of Chairman Thomas B. Holloway, Philadelphia, for the Committee from the Section to Cooperate with the National Committee for the Prevention of Blindness was read by Dr. Parker Heath, Detroit. The report was accepted.

Dr. Albert N. Lemoine, Kansas City, Mo., read the report of the Committee on Scientific Exhibit from the Section. The report was accepted.

Dr. Emory Hill, Richmond, Va., reported as section delegate to the House of Delegates.

There was no report from the Committee on Museum of Ophthalmic History; the committee was continued.

The report of the Committee on Ophthalmic Standards was presented by Dr. Clifford B. Walker, Los Angeles. The report was accepted and the committee continued.

The following officers were elected: chairman, Dr. William L. Benedict, Rochester, Minn.; vice chairman, Emory Hill, Richmond, Va.; secretary, Dr. Parker Heath, Detroit, continued in office.

Dr. S. J. Beach, Portland, Maine, was appointed as member of the American Board of Ophthalmology to fill the one year term expired of Dr. John Green.

Dr. Walter B. Lancaster, Boston, was reappointed to fill a vacancy on the American Committee (Joint) on Optics and Visual Physiology.

Dr. Georgiana Dvorak Theobald, Oak Park, Ill., was appointed to fill the vacancy of chairman of the Committee for Scientific Exhibit from the Section.

The chairman announced that there was no award of the Ophthalmic Research Medal of the American Medical Association this year.

The following members were elected to serve as the Knapp Medal Award Committee: Drs. E. V. L. Brown, Chicago; C. A. Clapp, Baltimore, and Frederick H. Verhoeff, Boston, chairman.

Dr. Albert L. Brown, Cincinnati, read a paper on "Effect of Intra-Ocular Typhoid Antibody Concentration on Experimental Corneal Ulcers." Discussed by Drs. Charles A. Bahn, New Orleans; Phillips Thygeson, Iowa City, and Albert L. Brown, Cincinnati.

Dr. Bertha A. Klien, Chicago, read a paper on "Malformations of the Posterior Segment of the Human Eye: An Embryologic Interpretation." Discussed by Drs. Henry C. Haden, Houston, Texas; Derrick T. Vail, Cincinnati, and Bertha A. Klien, Chicago.

Drs. Norman P. Scala, Washington, D. C., and Ernest A. Spiegel, Philadelphia, presented a paper on "The Cortical Innervations of Ocular Movements." Discussed by Drs. Alfred Bielschowsky, Hanover, N. H., and Ernest A. Spiegel, Philadelphia.

Dr. Harvey D. Lamb, St. Louis, read a paper on "Clinical and Anatomic Observations in Fellow Eyes with Chronic Tuberculous Uveitis." Discussed by Drs. Beulah Cushman, Chicago; Lawrence T. Post, St. Louis, and Harvey D. Lamb, St. Louis.

Dr. J. L. Bressler, Houston, Texas, read a paper on "A Study of More Than Two Hundred Postoperative Strabismus Cases." Discussed by Drs. Conrad Berens, New York; Albert N. Lemoine, Kansas City, Mo., and J. L. Bressler, Houston, Texas.

SECTION ON LARYNGOLOGY, OTOTOLOGY  
AND RHINOLOGY

WEDNESDAY, MAY 13—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr. Ralph A. Fenton, Portland, Ore.

Dr. Lyman G. Richards, Boston, read a paper on "Pitfalls in the Diagnosis and Treatment of Retropharyngeal Abscess in Children." Discussed by Drs. Samuel Iglauer, Cincinnati; Horace R. Lyons, Chicago; E. Frank Chase, Seattle; Gabriel Tucker, Philadelphia; William D. Black, St. Louis, and Lyman G. Richards, Boston.

Dr. Edward Cecil Sewall, San Francisco, read a paper on "Chronic Sinusitis: The Source and Carrier of the Common Cold." Discussed by Drs. Virgil W. McCarty, Kansas City, Mo.; T. R. Gittins, Sioux City, Iowa; Howard C. Ballenger, Winnetka, Ill.; Robert F. Ridpath, Philadelphia; Herman Semenov, Los Angeles, and Edward C. Sewall, San Francisco.

The application of Dr. Herman Brown, D.D.S., Irvington, N. J., was approved for Associate Fellowship in the American Medical Association.

Dr. Harris P. Mosher, Boston, read a paper on "Osteomyelitis of the Frontal Bone." Discussed by Drs. Ernest Sachs, St. Louis; John J. Shea, Memphis, Tenn.; O. Jason Dixon, Kansas City, Mo.; Joseph E. J. King, N. Y., and Harris P. Mosher, Boston.

Dr. Marvin M. Cullom, Nashville, Tenn., read a paper on "The Chronicity of Sinus Disease and Its Relation to Middle Ear Infection and Deafness." Discussed by Drs. Willis F.

Manges, Philadelphia; Carrol L. Smith, Spokane, Wash; O. S. Gilliland, Kansas City, Mo., and Marvin M. Cullom, Nashville

Dr Henry M. Goodyear, Cincinnati, read a paper on "The Etiology and Treatment of Hemorrhage of the Nose and Throat" Discussed by Drs Frank R. Spencer, Boulder, Colo., Sam E. Roberts, Kansas City, Mo., Thomas C. Galloway, Evanston, Ill., and Henry M. Goodyear, Cincinnati

#### THURSDAY, MAY 14—AFTERNOON

Dr Ralph A. Fenton, Portland, Ore., read the chairman's address, entitled "The Physiologic Approach to Otolaryngology"

Dr Albert Kuntz, St. Louis, read a paper on "The Autonomic Nervous System in Relation to Otolaryngology" Discussed by Drs Leo Stone, Topeka, Kan.; Gordon F. Harkness, Davenport, Iowa; Harris H. Vail, Cincinnati, and Albert Kuntz, St. Louis

Drs Loyal Davis and Edwin J. Blonder, Chicago, presented a paper on "The Galvanic Filling Reaction in Patients with Verified Intracranial Neoplasms"

Drs George M. Coates, Benjamin H. Shuster and Herman B. Slotkin, Philadelphia, presented a paper on "The Vestibular (Barany) Tests in the Diagnosis and Localization of Intracranial Lesions"

These two papers were discussed by Drs Winchell McK. Craig, Rochester, Minn.; Claude T. Uren, Omaha; John C. McKinley, Minneapolis; Sam E. Roberts, Kansas City, Mo.; Edwin J. Blonder, Chicago, and George M. Coates, Philadelphia

Dr Porter P. Vinson, Rochester, Minn., read a paper on "The Diagnosis and Treatment of Primary Malignant Disease of the Tracheobronchial Tree" Discussed by Drs John D. Kernan, New York; Edward H. Skinner, Kansas City, Mo.; Millard F. Arbuckle, St. Louis; Edwin N. Broyles, Baltimore, and Porter P. Vinson, Rochester, Minn.

Drs Samuel J. Crowe, and Edwin N. Broyles, Baltimore, presented a paper on "Late Results Following Operations for the Cure of Carcinoma of the Larynx" Discussed by Drs Gabriel Tucker, Philadelphia; Murdock S. Euen, Atlanta, Ga.; Gordon B. New, Rochester, Minn.; Louis H. Clerf, Philadelphia; E. Lee Myers, St. Louis, and Edwin N. Broyles, Baltimore

#### FRIDAY, MAY 15—AFTERNOON

The following officers were elected: chairman Robert F. Ridpath, Philadelphia; vice chairman Leroy A. Schall, Boston; secretary, Gordon B. New, Rochester, Minn.

Dr John J. Shea, Memphis, Tenn., reported for the American Board on Otolaryngology that they had held two examinations during 1935, one in New York City before the American Medical Association meeting, and the other before the meeting of the American Academy of Ophthalmology and Otolaryngology in Cincinnati. There were 146 candidates examined, of whom 113 passed and forty-five failed, the total number certificated to date being 2,411. It is of interest historically to see the growth of the examining boards now numbering nine with three in the stage of formation. The trail was originally blazed by the Ophthalmological Board and the Board of Otolaryngology. It is worthy of record to state that the idea of forming an advisory board for the various specialties originated in the Board of Otolaryngology. The advisory board is holding rigidly to the original conception that it should be an advisory board and not one of regulation. The advisory board in conjunction with the Council on Medical Education and Hospitals of the American Medical Association has limited the specialties in medicine to twelve. The report was received and placed on file.

Dr H. Marshall Taylor, Jacksonville, Fla., gave the report of the Committee on Hygiene of Swimming. The report was received and filed.

Dr Herman Semenov, Los Angeles, read a paper on "Otitis Media in Infants and Adults. A Histopathologic Study" Discussed by Drs William A. Wagner, New Orleans; Louis K. Guggenheim, St. Louis, and Herman Semenov, Los Angeles.

Dr H. I. Profant, Santa Barbara, Calif., read a paper on "Petrositis"

Dr Wells P. Eagleton, Newark, N. J., read a paper on "Osteomyelitis of the Inferior Surface of the Petrous Pyramid"

These two papers were discussed by Drs George M. Coates, Philadelphia; Harold I. Lillie, Rochester, Minn.; Mervin C. Myerson, New York; H. J. Profant, Santa Barbara, Calif.; and Wells P. Eagleton, Newark, N. J.

Dr James B. Costen, St. Louis, read a paper on "Neuralgias and Ear Symptoms Associated with Disturbed Function of the Temporomandibular Joint" Discussed by Drs Roland M. Klemme, St. Louis; Wendell G. Scott, St. Louis; Sam E. Roberts, Kansas City, Mo.; and James B. Costen, St. Louis.

Drs Walter B. Hoover and James L. Poppen, Boston, presented a paper on "Glossopharyngeal Neuralgia" Discussed by Drs J. Jay Keegan, Omaha; French K. Hansel, St. Louis, and Walter B. Hoover, Boston.

#### SECTION ON PEDIATRICS

##### WEDNESDAY, MAY 13—AFTERNOON

The meeting was called to order at 2:10 by the chairman, Dr. Horton R. Casparis, Nashville, Tenn.

Dr. Horton R. Casparis, Nashville, Tenn., read the chairman's address, entitled "Some of the Preventive Aspects of the Mental Health Problem"

Dr. Lvarts A. Graham, St. Louis, read a paper on "Surgical Aspects of Chronic Lung Infections in Children"

Drs Chevalier Jackson and Chevalier L. Jackson, Philadelphia, presented a paper on "Acute Infective Laryngotracheobronchitis of Children" Discussed by Drs Joseph Brennemann, Winnetka, Ill.; Clifford G. Grulee, Evanston, Ill.; Isaac A. Abt, Chicago; Ralph M. Tyson, Philadelphia, and Chevalier L. Jackson, Philadelphia.

Drs Adolph G. DeSanctis and Edward W. Peterson, New York, presented a paper on "Appendicitis in Children: A Survey of Three Hundred Cases" Discussed by Drs Rupert F. Carter, New York, and Leslie O. Ashton, New York.

Dr Percival Nicholson, Ardmore, Pa., read a paper on "Mechanical Lesions of the Appendix in Children as a Basis for Appendicitis" Discussion on the previous paper continued, in conjunction with discussion of Dr. Nicholson's paper, by Drs Walter Estell Lee, Philadelphia; Roland Hill, St. Louis; W. Ambrose McGee, Richmond, Va.; L. R. De Buys, New Orleans; Clifford Sweet, Oakland, Calif.; Joseph Brennemann, Winnetka, Ill.; Adolph G. DeSanctis, New York, and Percival Nicholson, Ardmore, Pa.

The chairman appointed Drs Clifford Sweet, Oakland, Calif.; Oscar Reiss, Los Angeles, and Leslie Moore, Dallas, Texas, as a resolutions committee.

Dr Robert A. Strong, New Orleans, read a paper on "Nanthomatosis (Schuller-Christian's Disease)" Discussed by Drs H. R. Wahl, Kansas City, Mo.; John Zahorsky, St. Louis, and Robert A. Strong, New Orleans.

##### THURSDAY, MAY 14—AFTERNOON

Dr Jean V. Cooke, St. Louis, read a paper on "Active Artificial Immunization in Diphtheria: The Relative Effectiveness of Various Antigens, and the Duration of the Immunity" Discussed by Drs Charles R. Barr, Philadelphia; J. V. Greenbaum, Cincinnati; H. F. Helmholtz, Rochester, Minn., and Jean V. Cooke, St. Louis.

Drs C. A. Neymann and S. L. Osborne, Chicago, presented a paper on "The Treatment of Chorea by Means of Electroparalysis" Discussed by Drs Maurice L. Blatt, Chicago, and C. A. Neymann, Chicago.

Dr Albert W. Snoke, San Francisco, read a paper on "The Classification and Prognosis of Glomerular Nephritis in Childhood" Discussed by Drs H. F. Helmholtz, Rochester, Minn., and Albert W. Snoke, San Francisco.

Dr Julius H. Hess, Chicago, read a paper on "The Chicago City-Wide Plan for the Care of Premature Infants" Discussed by Drs Maurice L. Blatt, Chicago, and William J. Orr, Buffalo.

Dr Aphrodite J. Hofsommer, Webster Groves, Mo., read a paper on "Lip Reading and the Intelligence Quotient of the Hard of Hearing Child" Discussed by Drs Horace Newhart,

Minneapolis; Horton R. Casparis, Nashville, Tenn., and Aphrodite J. Hofsommer, Webster Groves, Mo.

Dr. John Hart Davis, Cleveland, read a paper on "Segmental Neuralgia in Childhood Simulating Visceral Disease." Discussed by Drs. John A. Toomey, Lakewood, Ohio; Hugh L. Dwyer, Kansas City, Mo., and John Hart Davis, Cleveland.

#### FRIDAY, MAY 15—AFTERNOON

The following officers were elected: chairman, Dr. Ralph M. Tyson, Philadelphia; vice chairman, Dr. Aldrich C. Crowe, Ocean City, N. J.; secretary, Dr. Albert D. Kaiser, Rochester, N. Y.; executive committee: Dr. A. Graeme Mitchell, Cincinnati; Dr. Horton R. Casparis, Nashville, Tenn., and Dr. Ralph M. Tyson, Philadelphia; delegate, Dr. William Weston, Columbia, S. C.; alternate, Dr. A. Graeme Mitchell, Cincinnati; representative to serve on American Board of Pediatrics, Dr. Frank P. Gengenbach, Denver.

Dr. Frank C. Neff, Kansas City, Mo., presented the Report of the Committee on the Jacobi Fund as follows:

Dr. Olin West, who is, as you know, the Secretary and General Manager of the American Medical Association, has written to me that the Association cannot continue to publish the bound volumes of the Transactions of the various sections unless there come at least 350 orders for the particular section volume. It seems to many of us that it would be unfortunate to have an interruption in the archives of this section. The subscribers to the Jacobi Fund have made it possible thus far to continue our Transactions. It will be necessary either for the Jacobi Fund to underwrite the loss which the Association undergoes or there will be no continuance of our available printed records.

The Jacobi Committee, therefore, will undertake to secure enough subscriptions so that at least 350 copies of the Transactions may be assured the publishers. For this reason we are asking the friends of the section to subscribe in greater numbers, and we are reducing the amount asked to \$3 in the hope that many more will care to aid the fund and secure the volume. The committee is also asking that the number of men on the committee be reduced to three, instead of five, making it easier to have committee meetings. The personnel of the committee, therefore, will consist of each retiring chairman of this section, who will hold office for three years. It is expected within another year or two to make the secretary of the section, who actually holds office for three years, the active secretary and treasurer of the Jacobi Fund during that term. We would like to have a motion from the floor at the conclusion of this report regarding your wishes as to the Transactions, and the other changes suggested.

We wish to emphasize at this time the announcement which is appearing in the medical journals of the dedication of the monument to the memory of Abraham Jacobi, which is to take place on Saturday, June 13, at 2 p. m., at the beautiful shore village of Bolton Landing, Lake George, N. Y. This spot can be reached by bus or highway, and any physicians who may wish to do so are invited to attend the final session of the American Pediatric Society at that village Saturday morning, June 13, at 9:30, remaining for the dedication of the Jacobi Memorial in the afternoon. An interesting program has been prepared with well known pediatricians and educators, who will speak during the dedication. The Jacobi Memorial Fund is sponsor for the erection of this monument, to the memory of the much beloved pioneer who held the first chair in the teaching of pediatrics in America and who was an honored president of the American Medical Association. Dr. Frederic W. Schlutz, Chicago, of this section will be the presiding officer.

The finances of the Jacobi Fund are in excellent condition. A report thereof will be sent for publication by the American Medical Association and will appear, we hope, in another issue of the Transactions.

THE COMMITTEE OF THE ABRAHAM JACOBI  
MEMORIAL FUND, SECTION ON PEDIATRICS.  
J. I. DURAND, Seattle, 1936,  
Chairman.

FREDERIC W. SCHLUTZ, Chicago, 1937.  
ALFRED A. WALKER, Birmingham, Ala., 1938.  
GRAEME MITCHELL, Cincinnati, 1939.  
FRANK C. NEFF, Kansas City, Mo.,  
Secretary.

On motion of Dr. Oscar Reiss, Los Angeles, regularly seconded, it was voted that the report be adopted.

Dr. Norman Ward Clein, Seattle, read a paper on "Allergy as the Cause of Frequent Colds and Chronic Coughs in Children." Discussed by Drs. Ralph Bowen, Oklahoma City; George Piness, Los Angeles; James C. Overall, Nashville, Tenn.; F. M. Pottenger Jr., Monrovia, Calif., and Norman Ward Clein, Seattle.

Dr. Clifford Sweet, Oakland, Calif., read a paper on "Voluntary Food Habits of Normal Children." Discussed by Drs. W. C. C. Cole, Detroit; J. D. Boyd, Iowa City, and Clifford Sweet, Oakland, Calif.

Dr. Joseph C. Regan, Brooklyn, read a paper on "Changes in Acid Base Equilibrium in Whooping Cough: Relation to the Underlying Pathogenesis of the Disease—Therapeutic Significance." Discussed by Drs. Frank C. Neff, Kansas City, Mo.; W. Ambrose McGee, Richmond, Va., and Joseph C. Regan, Brooklyn.

Drs. Emil Bogen, Olive View, Calif., and M. A. Gifford, Bakersfield, Calif., presented a paper on "Immunization Against Infantile Paralysis." Discussed by Drs. J. P. Leake, Washington, D. C.; M. A. Gifford, Bakersfield, Calif.; Percival Nicholson, Ardmore, Pa.; S. D. Kramer, Brooklyn, and Emil Bogen, Olive View, Calif.

Dr. Paul H. Harmon, Chicago, read a paper on "Significance of Poliocidal Substances in Resistance and Recovery from Poliomyelitis." Discussed by Drs. Sydney O. Levinson and Paul H. Harmon, Chicago.

Dr. Archibald L. Hoyne, Chicago, read a paper on "Intravenous Treatment of Meningococcic Meningitis with Meningococcus Antitoxin." Discussed by Drs. Albert G. Bower, Glendale, Calif.; Gerald F. Kempf, Indianapolis; Gilbert J. Levy, Memphis, Tenn., and Archibald L. Hoyne, Chicago.

## SECTION ON PHARMACOLOGY AND THERAPEUTICS

### WEDNESDAY, MAY 13—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. Chauncey D. Leake, San Francisco.

On motion by Dr. Leonard G. Rowntree, Philadelphia, seconded and carried, it was voted that Dr. H. A. Shoemaker, professor of pharmacology, University of Oklahoma, be recommended to the House of Delegates as an Associate Fellow in the Association.

On motion by Dr. Leonard G. Rowntree, Philadelphia, seconded and carried, it was voted that approval be given to the resolution approving the action of the House of Delegates in petitioning Congress to allot at least 5,000,000 cubic feet of helium annually for medicinal purposes.

On motion by Dr. Rowntree, seconded and carried, a resolution to the House of Delegates of the American Medical Association was approved that the proper American Medical Association agencies make public whatever information is available regarding the medical aspects of chemical contraceptives.

On motion of Dr. Irving Wright, New York, seconded and carried, it was voted to endorse the plea for a Section on Anesthesia and to protest against expanding the Section on Pharmacology and Therapeutics to include anesthesia.

It was moved by Dr. Charles W. Dunn, Philadelphia, seconded and carried, that the House of Delegates be asked to petition Congress to apply the same regulations to the advertising of drugs as now apply to the labeling of them.

Drs. Charles Mazer and S. Leon Israel, Philadelphia, presented a paper on "Studies on the Optimal Dosage of Estrogenic Substances." Discussed by Drs. J. P. Pratt, Detroit; Marguerite S. Williams, Tucson, Ariz.; Elmer L. Sevringhaus, Madison, Wis.; Chauncey D. Leake, San Francisco, and Charles Mazer, Philadelphia.

Drs. Willard O. Thompson, Phoebe K. Thompson, Samuel G. Taylor III and William S. Hoffman, Chicago, presented a paper on "An Extract of the Adrenal Cortex Effective in Addison's Disease." Discussed by Drs. Russell M. Wilder, Rochester, Minn.; Leonard G. Rowntree, Philadelphia, and Willard O. Thompson, Chicago.

Drs. Leonard G. Rowntree and N. H. Einhorn, Philadelphia, and A. M. Hanson, Faribault, Minn., presented a paper on "The Role of the Thymus and Pineal Gland in Growth and Development." Discussed by Drs. Chauncey D. Leake, San

Francisco; George E. Wakerlin, Louisville, Ky.; John Z. Brown, Salt Lake City; Willard O. Thompson, Chicago, and Leonard G. Rowntree, Philadelphia.

Dr. Wolfgang Heubner, Berlin, Germany, read a paper on "Need for International Scientific Nomenclature for Therapeutic Substances." Discussed by Drs. Bernard Fantus, Chicago; John Z. Brown, Salt Lake City; W. F. Von Oettingen, Wilmington, Del.; P. N. Leech, Chicago; Chauncey D. Leake, San Francisco, and Wolfgang Heubner, Berlin, Germany.

Drs. D. E. Jackson and Helen L. Jackson, Cincinnati, presented a paper on "Experimental and Clinical Observations Regarding Angina Pectoris and Some Related Symptoms." Discussed by Drs. Lewis Gunther, Los Angeles; H. B. Haag, Richmond, Va.; Morris H. Nathanson, Minneapolis; George E. Wakerlin, Louisville, Ky.; Drew Luten, St. Louis, and D. E. Jackson, Cincinnati.

Drs. George R. Herrmann and George M. Decherd Jr., Galveston, Texas, presented a paper on "Further Studies on the Mechanism of Diuresis, with Especial Reference to the Action of Some Newer Diuretics." Discussed by Drs. Joseph M. Hayman Jr., Cleveland; Edward J. Stieglitz, Chicago; Benjamin Jablons, New York, and George R. Herrmann, Galveston, Texas.

Dr. Chauncey D. Leake, San Francisco, read the chairman's address, entitled "The Practical Pharmacology of Central Nervous System Depressant Drugs."

It was moved by Dr. Samuel M. Gordon, Chicago, seconded by Charles W. Dunn, Philadelphia, and carried, that the Section on Pharmacology and Therapeutics endorse the principle that discoverers of substances, simple or complex, possessing possible therapeutic uses communicate first with the Council on Pharmacy and Chemistry in order to determine whether or not they agree with the fundamental sound rules on nomenclature adopted by the Council before introducing coined names into the literature.

#### THURSDAY, MAY 14, MORNING

A joint meeting was held with the Section on Practice of Medicine. For a report of the proceedings, see the minutes of that section.

#### FRIDAY, MAY 15—MORNING

The following officers were elected: chairman, Dr. N. C. Gilbert, Chicago; vice chairman, Dr. Russell L. Haden, Cleveland; secretary, Dr. Irving Wright, New York; delegate, Dr. Cary Eggleston, New York; alternate, Dr. N. M. Keith, Rochester, Minn.; executive committee, Drs. Carl H. Greene, New York, Chauncey D. Leake, San Francisco, and N. C. Gilbert, Chicago.

It was regularly moved, seconded and carried that the section extend a vote of thanks to Dr. Russell L. Haden, Cleveland, for his three years of work as secretary of the section.

Drs. Walter L. Palmer and Paul S. Woodall, Chicago, presented a paper on "Cinchophen—Is There a Safe Method of Administration?" Discussed by Drs. Manfred W. Comfort, Rochester, Minn.; D. R. Cimenko, Cold Spring Harbor, N. Y.; R. Garfield Snyder, New York; Chauncey D. Leake, San Francisco, and Walter L. Palmer, Chicago, Ill.

Dr. Milton Plotz, Brooklyn, read a paper on "Postprandial Insulin: Individualizing Time of Administration of Insulin." Discussed by Drs. Ralph H. Major, Kansas City, Mo., and Russell M. Wilder, Rochester, Minn.

Drs. John Russell Twiss and Carl H. Greene, New York, presented a paper on "Results of Dietary and Medical Treatment in Disease of the Gallbladder." Discussed by Drs. George B. Eusterman, Rochester, Minn.; Chauncey D. Leake, San Francisco, and John Russell Twiss, New York.

Drs. Norman A. David, Cincinnati, and George A. Emerson, Morgantown, W. Va., presented a paper on "The Present Status of Research and Teaching in Pharmacology." Discussed by Drs. H. B. Haag, Richmond, Va.; Charles W. Greene, Columbia, Mo.; Carl A. Dragstedt, Chicago; George E. Wakerlin, Louisville, Ky.; D. R. Cimenko, Cold Spring Harbor, N. Y.; Chauncey D. Leake, San Francisco, and George A. Emerson, Morgantown, W. Va.

Dr. Bayard T. Horton, Rochester, Minn., read a paper on "Hypersensitiveness to Cold, with Local and Systemic Manifestations of a Histamine-Like Character: Its Amenability to Treatment." Discussed by Drs. Chauncey D. Leake, San Francisco; Isidore Kinkelman, Elgin, Ill.; A. C. Tenney, Chicago; Morris H. Nathanson, Minneapolis, and Bayard T. Horton, Rochester, Minn.

Dr. Carl A. Dragstedt, Chicago, read a paper on "A Pharmacologic Study of the Toxemia Theory of Surgical Shock." Discussed by Drs. Chauncey D. Leake, San Francisco, and Carl A. Dragstedt, Chicago.

## SECTION ON PATHOLOGY AND PHYSIOLOGY

#### WEDNESDAY, MAY 13—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr. Henry C. Sweany, Chicago.

The chairman appointed as a nominating committee, Drs. William Carpenter MacCarty, Rochester, Minn.; Harry J. Corper, Denver, and Israel Davidsohn, Chicago.

Dr. Henry C. Sweany, Chicago, read the chairman's address, entitled "Pathologic Interpretations of Roentgenologic Shadows in Pneumoconiosis."

Dr. Israel Davidsohn, Chicago, read a paper on "Serologic Diagnosis of Infectious Mononucleosis." Discussed by Drs. Richard H. Jaffé, Chicago; A. S. Giordano, South Bend, Ind., and Israel Davidsohn, Chicago.

Dr. Richard H. Jaffé, Chicago, read a paper on "Chronic Thyroiditis."

Dr. Arthur E. Hertzler, Halstead, Kan., read a paper on "End Results of Very Radical Thyroidectomies."

These two papers were discussed by Drs. Lindon Seed, Chicago; Leon Asher, Berne, Switzerland; Anton J. Carlson, Chicago; Richard H. Jaffé, Chicago, and Arthur E. Hertzler, Halstead, Kan.

Dr. Leon Asher, Berne, Switzerland, read a paper on "Nervous System and Internal Secretions." No discussion.

Drs. Harry J. Corper, Maurice L. Cohn and A. P. Damerow, Denver, presented a paper on "Specific Artificial Immunity in Tuberculosis." Discussed by Drs. Emil Bogen, Olive View, Calif.; Henry C. Sweany, Chicago, and Harry J. Corper, Denver.

Dr. Henry N. Harkins, Chicago, read a paper on "Surgical Shock in Peritonitis Due to Bile and to Liver Autolysis." Discussed by Drs. Thomas G. Orr, Kansas City, Mo.; Edward C. Mason, Oklahoma City; M. Pinson Neal, Columbia, Mo.; H. M. Trusler, Indianapolis; Anton J. Carlson, Chicago; Norman E. Freeman, Boston, and Henry N. Harkins, Chicago.

Dr. Edward J. Stieglitz, Chicago, read a paper on "The Blood Nitrite." Discussed by Drs. Anton J. Carlson, Chicago, and Edward J. Stieglitz, Chicago.

#### THURSDAY, MAY 14—AFTERNOON

The following papers were read as a symposium on "Vitamins":

Dr. C. G. King, Pittsburgh: "Chemistry of Vitamin C."

Dr. H. A. Mattill, Iowa City: "Chemistry of Vitamin A."

Dr. Richard J. Black, New York: "Chemistry of the Vitamin B Complex."

Dr. Charles E. Bills, Evansville, Ind.: "New Forms and Sources of Vitamin D."

Dr. S. B. Wolbach, Boston: "The Pathologic Changes Resulting from Vitamin Deficiencies."

Dr. John B. Youmans, Nashville, Tenn.: "The Present Status of Vitamin Deficiencies in Practice."

Dr. Anton J. Carlson, Chicago: "Physiology of Vitamins."

These seven papers were discussed by Drs. Arthur F. Abt, Chicago; Anton J. Carlson, Chicago, and S. B. Wolbach, Boston.

#### FRIDAY, MAY 15—AFTERNOON

The following officers were elected: chairman, Dr. W. E. Garrey, Nashville, Tenn.; vice chairman, Dr. R. R. Kracke, Emory University, Ga.; secretary, Dr. J. J. Moore, Chicago; delegate, Dr. D. J. Davis, Chicago; alternate, Dr. J. J. Moore, Chicago; executive committee, Drs. Elias P. Lyon, Minneapolis; Henry C. Sweany, Chicago, and W. E. Garrey, Nashville, Tenn.

Secretary Moore made a report for the committee that was appointed last year to meet with the committee from the American Society of Clinical Pathologists, as follows:

This committee was empowered to act for the certification of pathologists and reports issued by them.

during the year. A set of by-laws was formulated by this joint committee, which has been accepted by the advisory board of the Boards for Specialties. A preliminary meeting was held in Kansas City with the members of the board appointed by the American Society of Clinical Pathologists. At this preliminary meeting, the incorporation of the American Board of Pathology in Michigan was authorized.

Dr. A. H. Sanford, Rochester, Minn., was nominated temporary chairman, and Dr. Frank A. Hartman, Columbus, Ohio, temporary secretary-treasurer of the board.

It is hoped that the Board of Pathology will be giving examinations at the Atlantic City meeting of the American Medical Association, or probably it will be active enough to give an examination some place this fall.

On motion duly made, seconded and carried, it was voted to adopt the report of the committee as presented.

Dr. Gregory Schwartzman, New York, read a paper on "The Phenomenon of Local Tissue Reactivity to Bacterial Filtrates: The Role of Altered Vascular Response in Certain Human Diseases." Discussed by Dr. Gregory Schwartzman, New York.

Drs. Milton B. Cohen, Benjamin S. Kline and Anna May Young, Cleveland, presented a paper on "The Clinical Diagnosis of Periarthritis Nodosa." Discussed by Drs. Henry C. Sweany, Chicago, and Milton B. Cohen, Cleveland.

Dr. William Carpenter MacCarty, Rochester, Minn., read a paper on "Identification of the Cancer Cell." Discussed by Dr. William Carpenter MacCarty, Rochester, Minn.

Dr. James P. Simonds, Chicago, read a paper on "The Effects of Intravenous Injections of Salt Solution in Collapse Due to Mechanical Impounding of Blood in the Splanchnic Region." No discussion.

Dr. Samuel M. Feinberg, Chicago, read a paper on "Seasonal Hay Fever and Asthma Due to Molds." Discussed by Drs. Henry C. Sweany, Chicago; George R. Herrmann, Galveston, Texas, and Samuel M. Feinberg, Chicago.

Dr. Jack Clayton Norris, Atlanta, Ga., read a paper on "Syphilis of the Myocardium and Coronary Arteries." Discussed by Drs. James L. Dubrow, Des Moines, Iowa; George R. Herrmann, Galveston, Texas; Morris H. Nathanson, Minneapolis; Henry C. Sweany, Chicago, and Jack Clayton Norris, Atlanta, Ga.

Drs. Frank W. Hartman and Andrew H. Dowdy, Detroit, presented a paper on "The Physiologic Effects of Fever Therapy as Related to the Preparation and Various Sedatives Employed." Discussed by Dr. James L. Dubrow, Des Moines, Iowa.

## SECTION ON NERVOUS AND MENTAL DISEASES

### WEDNESDAY, MAY 13—MORNING

The meeting was called to order at 9:15 by the chairman, Dr. Hans H. F. Reese, Madison, Wis.

Dr. Walter Freeman, Washington, D. C., presented the following resolution:

WHEREAS, There is need for a wider and more equal distribution of facilities for the care and treatment of the mentally ill; and

WHEREAS, The standards of such care may be improved by the collection and study of data pertaining to mental hospital services in the United States; and

WHEREAS, The measures and facilities for training personnel in nervous and mental diseases are of very great importance in bringing about improved standards; and

WHEREAS, The joint cooperative committee has been organized for the conduct of a national survey of mental hospital services; and

WHEREAS, That committee has invited the Section on Nervous and Mental Diseases of the American Medical Association to designate two representatives of that section to serve with the committee; therefore be it

Resolved, That the House of Delegates of the American Medical Association approves the designation of two members of its Section on Nervous and Mental Diseases to serve as members of the cooperative committee for the survey of public mental hospital services in the United States.

On motion regularly made and seconded, the foregoing resolution was approved, to be transmitted to the House of Delegates.

Drs. J. Grafton Love and James W. Kernohan, Rochester, Minn., presented a paper on "Epidermoid Tumors of the Brain." Discussed by Drs. Ernest Sachs, St. Louis; R. Glen Spurling,

Louisville, Ky.; Joseph E. J. King, New York; Walter E. Dandy, Baltimore, and J. Grafton Love, Rochester, Minn.

Dr. Henry W. Newman, San Francisco, read a paper on "Encephalography with Ethylene." Discussed by Drs. John J. Keegan, Omaha; Mabel G. Masten, Madison, Wis.; J. Grafton Love, Rochester, Minn.; Temple Fay, Philadelphia, and Henry W. Newman, San Francisco.

Drs. R. Glen Spurling and Frank H. Mayfield, Louisville, Ky., presented a paper on "Neoplasms of the Spinal Cord: Report of a Series of Forty-Two Surgical Cases." Discussed by Drs. Percival Bailey, Chicago; Frank R. Teachenor, Kansas City, Mo., and R. Glen Spurling, Louisville, Ky.

Dr. Walter E. Dandy, Baltimore, read a paper on "Newer Aspects of Mènière's Disease: Diagnosis and Treatment." Discussed by Drs. Frank R. Teachenor, Kansas City, Mo.; Francis C. Grant, Philadelphia, and Walter E. Dandy, Baltimore.

Dr. Francis C. Grant, Philadelphia, read a paper on "Alcohol Injection in the Treatment of Major Trigeminal Neuralgia." Discussed by Drs. Walter E. Dandy, Baltimore; J. Grafton Love, Rochester, Minn.; Peter Bassoe, Chicago; Ernest Sachs, St. Louis; James Rudolph Jaeger, Denver; A. L. Skoog, Kansas City, Mo., and Francis C. Grant, Philadelphia.

Dr. Edgar A. Kahn, Ann Arbor, Mich., read a paper on "The Treatment of Encapsulated Brain Abscess: A Method Whereby the Wall Is Brought To or Above the Surface Preliminary to Drainage." Discussed by Drs. R. Glen Spurling, Louisville, Ky.; Joseph E. J. King, New York; Walter E. Dandy, Baltimore; Temple Fay, Philadelphia; James Rudolph Jaeger, Denver; Percival Bailey, Chicago, and Edgar A. Kahn, Ann Arbor, Mich.

### THURSDAY, MAY 14—MORNING

The following papers were read as a symposium on "The Action Potentials of the Brain."

Drs. Hallowell Davis and Pauline A. Davis, Boston: "I. In Normal Persons and in Normal States of Cerebral Activity."

Dr. George Kreezer, Vineland, N. J.: "II. In Certain Types of Mental Deficiency."

Drs. Frederic A. Gibbs, William G. Lennox and Erna L. Gibbs, Boston: "III. In Epilepsy: (1) Significance for Diagnosis and Localization; (2) Effect of Drugs and of Conditions Which Influence Seizures."

These three papers were discussed by Drs. L. E. Travis, Iowa City; George H. Bishop, St. Louis; Ernest A. Spiegel, Philadelphia; Temple Fay, Philadelphia; Hallowell Davis, Boston; George Kreezer, Vineland, N. J.; Frederic A. Gibbs, Boston, and William G. Lennox, Boston.

Dr. A. E. Bennett, Omaha, read a paper on "Fever Therapy in *Tuberculosis Dorsalis*: The Relief of Gastric Crises and Lightning Pains by the Use of the Kettering Hypertherm." Discussed by Drs. Franklin G. Ebaugh, Denver; Henry W. Woltman, Rochester, Minn., and A. E. Bennett, Omaha.

Drs. Clarke H. Barnacle, Franklin G. Ebaugh and Jack R. Ewalt, Denver, presented a paper on "A Comparative Study of Artificial Hyperpyrexia and Therapeutic Malaria in the Treatment of Dementia Paralytica: A Preliminary Report." Discussed by Drs. A. E. Bennett, Omaha; Paul A. O'Leary, Rochester, Minn.; Walter Freeman, Washington, D. C.; William Nelson, St. Louis; Hans H. F. Reese, Madison, Wis., and Clarke H. Barnacle, Denver.

### FRIDAY, MAY 15—MORNING

The following officers were elected: chairman, Dr. Henry R. Viets, Boston; vice chairman, Dr. B. Landis Elliott, Kansas City, Mo.; secretary, Dr. Paul C. Bucy, Chicago; delegate, Dr. Tom B. Throckmorton, Des Moines; alternate, Dr. Edward Delehanty, Denver; executive committee: Drs. H. Douglas Singer, Chicago; Hans H. F. Reese, Madison, Wis.; Henry R. Viets, Boston.

Dr. Walter Freeman, Washington, D. C., made the following report, as representative of the section on the American Board of Psychiatry and Neurology:

Since the Atlantic City session of the American Medical Association in 1935 the American Board of Psychiatry and Neurology has held two meetings for the examination and certification of candidates. At the meeting in New York, Dec. 29 and 30, 1935, thirty-seven candidates were certified in psychiatry, nine candidates in neurology and thirty-two candidates in both psychiatry and neurology. At the meeting held in St. Louis, May 8 and 9, 1936, twenty-nine candidates were

certified in psychiatry, six candidates were certified in neurology and twenty-nine candidates were certified in both psychiatry and neurology.

Lists of the physicians certified have been published in the *Archives of Neurology and Psychiatry* and the *American Journal of Psychiatry*.

At the annual meeting in New York, Dec. 29, 1935, the following officers and directors were elected: president, Dr. H. Douglas Singer, Chicago; vice president, Dr. C. Macfie Campbell, Boston; secretary-treasurer, Dr. Walter Freeman, Washington, D. C.; Directors: Dr. Louis Casamajor, New York; Dr. Clarence O. Cheney, New York; Dr. Franklin G. Ebaugh, Denver; Dr. George W. Hall, Chicago; Dr. J. Allen Jackson, Danville, Pa.; Dr. Adolf Meyer, Baltimore; Dr. Lewis J. Pollock, Chicago; Dr. Edwin G. Zabriskie, New York; Dr. Lloyd H. Ziegler, Albany, N. Y.

The term of office of Dr. Lloyd H. Ziegler, nominee from the Section on Nervous and Mental Diseases to the American Board of Psychiatry and Neurology, has expired, and the nomination for his successor is in order.

A committee on graduate education has been appointed to study the facilities for postgraduate work in psychiatry and neurology.

Dr. Tom B. Throckmorton, Des Moines, Iowa, delegate, made his report and stated that the House of Delegates had acted favorably on the resolution referred to it by the section for the appointment of two representatives on the committee to work in conjunction with the United States Public Health Service in making a survey of public mental hospitals in the United States.

Dr. Lloyd H. Ziegler, Albany, N. Y., was chosen as a member of the American Board of Psychiatry and Neurology for a term of four years.

Drs. Franklin G. Ebaugh, Denver, and J. Allen Jackson, Danville, Pa., were chosen as members of the Joint Committee for the Study and Survey of Public Mental Hospitals in the United States.

Dr. Hans H. F. Reese, Madison, Wis., read the chairman's address, entitled "The History of Scalping and Its Clinical Aspects."

Dr. Charles H. Kimberly, Stockbridge, Mass., read a paper on "Psychoneurotic Depressions." Discussed by Drs. William Nelson, St. Louis, and Charles H. Kimberly, Stockbridge, Mass.

Dr. Charles Bradley, East Providence, R. I., read a paper on "A Children's Hospital for Neurologic and Behavior Disorders: Five Years' Experience at the Emma Pendleton Bradley Home." Discussed by Drs. William G. Lennox, Boston; William Nelson, St. Louis, and Charles Bradley, East Providence, R. I.

Dr. Homer P. Rush, Portland, Ore., read a paper on "Interdependence Between the Visceral Nervous System and the Endocrine System." Discussed by Dr. T. Homer Coffen, Portland, Ore.

Dr. J. M. Nielsen, Los Angeles, read a paper on "Unilateral Cerebral Dominance as Related to Mind-Blindness: The Minimal Lesion Capable of Causing Visual Agnosia for Objects." Discussed by Drs. A. L. Skoog, Kansas City, Mo.; William Nelson, St. Louis; Hans H. F. Reese, Madison, Wis., and J. M. Nielsen, Los Angeles.

Drs. Louis L. Tureen, Sidney I. Schwab and Joseph J. Gitt, St. Louis, presented a paper on "Toxic Focal Lesions in the Central Nervous System." Discussed by Drs. Peter Bassoe, Chicago; Walter Freeman, Washington, D. C., and Louis L. Tureen, St. Louis.

## SECTION ON DERMATOLOGY AND SYPHILOLOGY

### WEDNESDAY, MAY 13—MORNING

The meeting was called to order at 9:10 by the chairman, Dr. Harry R. Foerster, Milwaukee.

Dr. C. W. Finnerud, Chicago, reported for the Scientific Exhibit Committee a balance of \$145.93 and announced that the proposed exhibit for the next annual session was one on diseases of the mouth. The chair appointed an auditing committee consisting of Dr. Howard T. Phillips, Wheeling, W. Va., and Dr. Michael Ebert, Chicago, to audit the account of the Scientific Exhibit Committee.

Dr. C. Guy Lane, Boston, read the report of the American Board of Dermatology.

Dr. Harold N. Cole, Cleveland, reported for the Committee on the International Congress at Budapest, at which an International Society was formed, which has already compiled a directory of dermatologists of the entire world and is now working on an illustrated atlas for a universal system of terms for use in dermatology. Dr. Howard Fox, New York, supplemented Dr. Cole's report with a brief explanation of the objects of the International Dermatological Society.

Resolutions of sympathy were adopted on the death of Dr. Josef Jadassohn (on motion of Dr. John Eric Dalton, Indianapolis) and Dr. Jeffrey C. Michael, Houston, Texas (on motion of Dr. Howard Morrow, San Francisco) and the secretary was instructed to transmit them to the families of the deceased.

Dr. Harry R. Foerster, Milwaukee, read the chairman's address, entitled "Some Observations on Industrial Dermatology."

Drs. Herbert S. Alden and Jack W. Jones, Atlanta, Ga., presented a paper on "A Modification of Therapy with Gold Compounds in Lupus Erythematosus." Discussed by Drs. James K. Howles, New Orleans; M. E. Obermayer, Chicago; Martin Engman Jr., St. Louis; John Howard King, Nashville, Tenn.; D. W. Goldstein, Fort Smith, Ark.; Wiley M. Sams, Miami, Fla.; Herbert Rattner, Chicago, and Herbert S. Alden, Atlanta, Ga.

Dr. Hamilton Montgomery, Rochester, Minn., read a paper on "Histopathology of Various Types of Cutaneous Tuberculosis." Discussed by Drs. Duncan O. Poth, San Antonio, Texas; Marion B. Sulzberger, New York; Richard L. Sutton Jr., Kansas City, Mo.; C. W. Finnerud, Chicago; Herbert S. Alden, Atlanta, Ga.; Donald M. Pillsbury, Philadelphia, and Hamilton Montgomery, Rochester, Minn.

Drs. James W. Jordon and Earl D. Osborne, Buffalo, presented a paper on "Besnier-Boeck's Disease." Discussed by Drs. J. P. Guequierre, Philadelphia; Marion B. Sulzberger, New York; Moses Scholtz, Los Angeles, and James W. Jordon, Buffalo.

Drs. Fred Wise, Charles R. Rein and David L. Satenstein, New York, presented a paper on "Lichen Ruber Moniliformis: Report of a Hitherto Undescribed Variety of a Rare Dermatitis." Discussed by Drs. F. M. Jacob, Pittsburgh; Hamilton Montgomery, Rochester, Minn.; L. H. Winer, Minneapolis; Fred D. Weidman, Philadelphia, and Charles R. Rein, New York.

Drs. James T. Wayson, Honolulu, H. I., and Fred D. Weidman, Philadelphia, presented a paper on "Aleukemic Reticulosis: An Additional Member of the So-Called Cutaneous Lymphoblastomas."

Dr. Francis W. Lynch, St. Paul, read a paper on "Cutaneous Lesions Associated with Monocytic Leukemia and Reticulo-Endotheliosis."

These two papers were discussed by A. B. Loveman, Louisville, Ky.; Arthur W. Stillians, Chicago; Hamilton Montgomery, Rochester, Minn.; D. W. Goldstein, Fort Smith, Ark.; M. G. Bohrod, Peoria, Ill.; Fred D. Weidman, Philadelphia, and Francis W. Lynch, St. Paul.

### THURSDAY, MAY 14—MORNING

The chairman appointed Dr. Howard Morrow, San Francisco, to fill the vacancy on the executive committee caused by the death of Dr. Jeffrey C. Michael, Houston, Texas.

Dr. Michael Ebert, Chicago, reported that the auditing committee appointed to audit the accounts of the Scientific Exhibit Committee had found them correct.

Dr. Marion B. Sulzberger, New York, presented the following report for the Committee on Industrial Dermatoses:

Your committee met yesterday under the chairmanship of Dr. C. Guy Lane, Boston. Your committee recommends that a central clearing house be established for the recording and dissemination of information on industrial dermatoses. It recommends that its studies be continued, in cooperation with the Section on Preventive and Industrial Medicine and Public Health with the United States Public Health Service and with the American Dermatological Association, for the purpose of establishing a cooperative approach to the problems of industrial skin diseases. It further recommends that the committee

be empowered to appoint local subcommittees in various states or districts to gather information and to report operations to this central section committee.

The report was adopted on motion of Dr. C. W. Finnerud, Chicago, regularly seconded and carried.

Drs. Eugene A. Hand and Udo J. Wile, Ann Arbor, Mich., presented a paper on "The Treatment of Lip Cancer: A Clinical Survey of Four Hundred Cases Treated by Different Methods." Discussed by Drs. Everett S. Lain, Oklahoma City; Richard L. Sutton Sr., Kansas City, Mo.; James F. Percy, Los Angeles; Merlin T.-R. Maynard, San Jose, Calif.; H. J. Templeton, Oakland, Calif.; Harry P. Jacobson, Los Angeles; Everett C. Fox, Dallas, Texas; C. F. Lehmann, San Antonio, Texas, and Udo J. Wile, Ann Arbor, Mich.

Drs. Adolph Rostenberg Jr. and Marion B. Sulzberger, New York, presented a paper on "Some Patch Test Observations Based on Five Years' Experience in More Than Nine Hundred Patients with More Than Ten Thousand Tests." Discussed by Drs. M. E. Obermayer, Chicago; S. W. Becker, Chicago; Paul A. O'Leary, Rochester, Minn.; Adolph Rostenberg Jr., New York, and Marion B. Sulzberger, New York.

Drs. Donald M. Pillsbury and Thomas H. Sternberg, Philadelphia, presented a paper on "The Relation of Diet to Skin Infection: A Study of the Influence of High and Low Carbohydrate and High Fat Intakes and Starvation on Experimental Pyogenic Infections in Dogs." Discussed by Drs. John F. Madden, St. Paul; Arthur Schoch, Dallas, Texas; Theodore Cornbleet, Chicago; Victor E. Levine, Omaha; Moses Scholtz, Los Angeles, and Donald M. Pillsbury, Philadelphia.

Drs. E. William Abramowitz, New York, and Maurice H. Noun, Des Moines, Iowa, presented a paper on "Fixed" Drug Eruptions." Discussed by Drs. Marque O. Nelson, Tulsa, Okla., and Maurice H. Noun, Des Moines, Iowa.

Dr. Carl W. Laymon, Minneapolis, read a paper on "Extra-cellular Cholesterinosis." Discussed by Drs. C. Guy Lane, Boston; Hamilton Montgomery, Rochester, Minn., and Carl W. Laymon, Minneapolis.

Dr. James Herbert Mitchell, Chicago, read a paper on "Streptococcic Dermatoses of the Ears." Discussed by Drs. Clinton W. Lane, St. Louis; S. W. Becker, Chicago; Anthony C. Cipollaro, New York; Samuel Ayres Jr., Los Angeles; D. T. Gandy, Houston, Texas; Moses Scholtz, Los Angeles, and James Herbert Mitchell, Chicago.

Dr. Theodore Cornbleet, Chicago, read a paper on "Vitamin C and Pigment." Discussed by Drs. S. W. Becker, Chicago; Donald M. Pillsbury, Philadelphia, and Theodore Cornbleet, Chicago.

#### FRIDAY, MAY 15—MORNING

The following officers were elected: chairman, Dr. Paul A. O'Leary, Rochester, Minn.; vice chairman, Dr. Charles C. Dennie, Kansas City, Mo.; secretary, Dr. Bedford Shelmire, Dallas, Texas; delegate, Dr. Clyde L. Cummer, Cleveland; alternate, Dr. Harold N. Cole, Cleveland; member of the American Board of Dermatology for four consecutive one-year terms, Dr. C. Guy Lane, Boston; chairman, Scientific Exhibit Committee, Dr. Clark W. Finnerud, Chicago; executive committee, Dr. Howard Morrow, San Francisco; Dr. Harry R. Foerster, Milwaukee; Dr. Paul A. O'Leary, Rochester, Minn.

Drs. J. J. Eller and K. A. Kazanjian, New York, presented a paper on "Clinical Evaluation of a New Trichophyton Extract: 'Dermatomycol.'" Discussed by Drs. Harry P. Jacobson, Los Angeles; Marion B. Sulzberger, New York; Joseph Grindon Jr., St. Louis; Norman Epstein, San Francisco; W. F. Spiller, Galveston, Texas, and J. J. Eller, New York.

Dr. E. W. Netherton, Cleveland, read a paper on "Arsphenamine Resistant Early Syphilis in Two Instances of Conjugal Infection." Discussed by Drs. John Eric Dalton, Indianapolis; Arthur W. Stillians, Chicago; Harry M. Robinson, Baltimore, and E. W. Netherton, Cleveland.

Drs. Max S. Wien and Minnie Oboler Perlstein, Chicago, presented a paper on "Ulcerative Lesions of the Skin in Lymphogranuloma Inguinale." Discussed by Drs. C. C. Tomlinson, Omaha; Harry M. Robinson, Baltimore; Samuel Goldblatt, Cincinnati; Paul A. O'Leary, Rochester, Minn.; Andrew L. Glaze, Birmingham, Ala.; Marion B. Sulzberger, New York, and Max S. Wien, Chicago.

Dr. R. A. Vonderlehr, Washington, D. C., read a paper on "Untreated Syphilis in the Male Negro: A Comparative Study of Treated and Untreated Cases." Discussed by Drs. Charles

C. Dennie, Kansas City, Mo.; Harry M. Robinson, Baltimore; Arthur G. Schoch, Dallas, Texas; James K. Howles, New Orleans, and R. A. Vonderlehr, Washington, D. C.

Drs. J. R. Driver, George W. Binkley and Maurice Sullivan, Cleveland, presented a paper on "Cod Liver Oil Ointments in the Treatment of Indolent Ulcers." Discussed by Drs. Everett C. Fox, Dallas, Texas; Paul Foster, Los Angeles; Harry P. Jacobson, Los Angeles; Adolph Rostenberg Jr., New York; Merlin T.-R. Maynard, San Jose, Calif.; D. W. Goldstein, Fort Smith, Ark.; Fred D. Weidman, Philadelphia; John Downing, Boston; Norman Epstein, San Francisco; Everett Seale, Houston, Texas; J. J. Eller, New York, and J. R. Driver, Cleveland.

On behalf of the section the chairman extended the thanks of the members for the hospitality and arrangements provided by the Kansas City members. There followed the induction of officers, after which the meeting adjourned.

### SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

#### WEDNESDAY, MAY 13—AFTERNOON

The meeting was called to order at 2:15 by the chairman, Dr. R. R. Sayers, Washington, D. C.

The chairman announced the appointment of Drs. J. N. Baker, Montgomery, Ala., and Irl C. Riggan, Richmond, Va., to the executive committee to take the places of Drs. Wilson G. Smillie, Boston, and Robert H. Riley, Baltimore, absent.

Dr. R. R. Sayers, Washington, D. C., read the chairman's address, entitled "Industrial Hygiene Problems in the United States."

Dr. George H. Gehrmann, Wilmington, Del., read a paper on "Papilloma and Carcinoma of the Urinary Bladder in Dye Workers." Discussed by Drs. Victor D. Washburn, Wilmington, Del.; J. N. Baker, Montgomery, Ala.; W. F. von Oettingen, Wilmington, Del., and George H. Gehrmann, Wilmington, Del.

Drs. W. C. Dreessen and R. R. Jones, Washington, D. C., presented a paper on "Anthracosilicosis." Discussed by Drs. R. R. Sayers, Washington, D. C.; R. R. Jones, Washington, D. C., and W. C. Dreessen, Washington, D. C.

Dr. Henry Field Smyth, Philadelphia, read a paper on "Safe Practices in the Industrial Use of Carbon Tetrachloride." Discussed by Drs. Paul A. Davis, Akron, Ohio; W. F. von Oettingen, Wilmington, Del.; W. J. McConnell, New York, and Henry Field Smyth, Philadelphia.

Drs. H. H. Schrenk and W. P. Yant, Pittsburgh, presented a paper on "A New Procedure for the Control of Benzene Poisoning." Discussed by Drs. Henry Field Smyth, Philadelphia; Paul A. Davis, Akron, Ohio, and H. H. Schrenk, Pittsburgh.

#### THURSDAY, MAY 14—AFTERNOON

Dr. J. P. Leake, Washington, D. C., read a paper on "Poliomyelitis: Present Knowledge and Its Bearing on Control." Discussed by Drs. James D. Trask, New Haven, Conn.; Sidney D. Kramer, Brooklyn; Paul H. Harmon, Chicago, and J. P. Leake, Washington, D. C.

Dr. Theodore C. Hempelmann, St. Louis, read a paper on "Immediate Treatment and After-Care of Poliomyelitis Patients." Discussed by Drs. A. G. Bower, Los Angeles; Paul H. Harmon, Chicago, and Theodore C. Hempelmann, St. Louis.

Dr. V. H. Bassett, Savannah, Ga., read a paper on "Rabies and What to Do for the Person Bitten." Discussed by Drs. Edwin H. Schorer, Kansas City, Mo.; J. P. Leake, Washington, D. C.; Thurman B. Rice, Indianapolis, and V. H. Bassett, Savannah, Ga.

Drs. A. E. Keller, Crit Pharris and W. H. Gaub, Nashville, Tenn., presented a paper on "The Opsonocytaphagic, Allergic and Agglutination Reactions in the Diagnosis of Undulant Fever." Discussed by Drs. W. S. Leathers, Nashville, Tenn.; J. N. Baker, Montgomery, Ala., and John B. Youmans, Nashville, Tenn.

Drs. T. H. D. Griffiths and Henry Hanson, Jacksonville, Fla., presented a paper on "Significance of an Epidemic of Dengue." Discussed by Drs. V. H. Bassett, Savannah, Ga., and T. H. D. Griffiths, Jacksonville, Fla.

Mr. O. C. Durham, Chicago, read a paper on "The Evaluation of the Ragweed Hay Fever Resort Areas of North America." Discussed by Dr. Warren T. Vaughan, Richmond, Va., and Mr. O. C. Durham, Chicago.

#### FRIDAY, MAY 15—AFTERNOON

The following officers were elected: chairman, Dr. L. D. Bristol, New York; vice chairman, Dr. Joseph F. Bredeck, St. Louis; secretary, Dr. Irl C. Riggan, Richmond, Va.; executive committee: Dr. Robert H. Riley, Baltimore; Dr. R. R. Sayers, Washington, D. C., and Dr. L. D. Bristol, New York; delegate, Dr. Stanley H. Osborn, Hartford, Conn.

Dr. Stanley H. Osborn, Hartford, Conn., made his report as delegate.

On motion made by Dr. Stanley H. Osborn, Hartford, Conn., seconded by Dr. E. G. Brown, Topeka, Kan., it was voted that the incoming chairman of the section appoint a committee on accident control and safety to study the various medical aspects of accident control and make recommendations to the next annual meeting, with the suggestion that a resolution thereupon be presented to the House of Delegates through the section delegate.

Dr. Joseph F. Bredeck, St. Louis, read a paper on "What Service Does a Health Department Render to the Practicing Physician?" Discussed by Drs. Stanley H. Osborn, Hartford, Conn., and Joseph F. Bredeck, St. Louis.

Dr. E. G. Brown, Topeka, Kan., read a paper on "The Functions of a State Health Department." Discussed by Drs. Walter L. Bierring, Des Moines, Iowa, and E. G. Brown, Topeka, Kan.

Dr. W. W. Bauer, Chicago, read a paper on "The Physician's Place in the Public Health Program." Discussed by Drs. George M. Lyon, Huntington, W. Va.; Stanley H. Osborn, Hartford, Conn., and W. W. Bauer, Chicago.

Dr. L. D. Bristol, New York, read a paper on "Medical Aspects of Accident Control." Discussed by Drs. John H. Ogilvie, Kansas City, Mo.; Louis J. Hirschman, Detroit; Stanley H. Osborn, Hartford, Conn., and L. D. Bristol, New York.

Dr. H. T. Dean, Washington, D. C., read a paper on "Chronic Endemic Dental Fluorosis." Discussed by Dr. Carl F. Jordan, Des Moines, Iowa.

#### SECTION ON UROLOGY

##### WEDNESDAY, MAY 13—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr. John H. Morrissey, New York.

Drs. George H. Ewell, Madison, Wis., and Charles R. Marquardt and James C. Sargent, Milwaukee, presented a paper on "Hydrocele: Its Treatment by the Injection Method." Discussed by Drs. Nelse F. Ockerblad, Kansas City, Mo., and H. W. E. Walther, New Orleans.

Dr. T. D. Moore, Memphis, Tenn., read a paper on "Ureteropelvic Obstruction of the Noncalculous Type in Hydronephrosis." Discussed by Drs. Roy B. Henline, New York; Neil S. Moore, St. Louis; John R. Caulk, St. Louis; Waltman Walters, Rochester, Minn.; Frederic E. B. Foley, St. Paul; Myron J. Hahn, Boston, and T. D. Moore, Memphis, Tenn.

Dr. Charles C. Higgins, Cleveland, read a paper on "Present Status of Dietary Regimens in Treatment of Urinary Calculi."

Dr. Anson L. Clark, Oklahoma City, read a paper on "Present Status of Dietary Regimens in Urinary Infections."

These two papers were discussed by Drs. William F. Braasch, Rochester, Minn.; Richard Chute, Boston; Charles C. Higgins, Cleveland; John K. Ormond, Detroit, and Anson L. Clark, Oklahoma City.

Dr. Walter G. Maddock, Ann Arbor, Mich., read a paper on "Water Balance in Surgical Patients." Discussed by Drs. Leonard G. Rowntree, Philadelphia; A. J. Scholl, Los Angeles, and Walter G. Maddock, Ann Arbor, Mich.

Dr. D. K. Rose, St. Louis, read a paper on "The Present Status of Cystometry." Discussed by Drs. Lloyd G. Lewis, Baltimore; A. Lloyd Stockwell, Kansas City, Mo.; Richard Chute, Boston, and D. K. Rose, St. Louis.

##### THURSDAY, MAY 14—AFTERNOON

Dr. Frederic E. B. Foley, St. Paul, read a paper on "Aseptic Ureterosigmoidostomy." Discussed by Nelse F. Ockerblad, Kansas City, Mo.

Dr. John H. Morrissey, New York, read the chairman's address.

Dr. C. A. Owens, Omaha, read a paper on "The Value of Fever Therapy in the Treatment of Gonorrhea."

These two papers were discussed by Drs. L. G. Stuhler, Rochester, Minn.; John K. Ormond, Detroit; Anson L. Clark, Oklahoma City; O. A. Nelson, Seattle; H. L. Kretschmer, Chicago, and C. A. Owens, Omaha.

Dr. Gershom J. Thompson, Rochester, Minn., read a paper on "Transurethral Surgery: Changing Conceptions During the Past Five Years."

Dr. N. G. Alcock, Iowa City, read a paper on "Results of Transurethral Prostatic Resection."

These two papers were discussed by Drs. George R. Livermore, Memphis, Tenn.; H. L. Kretschmer, Chicago; William J. Engel, Cleveland; Louis M. Orr Jr., Orlando, Fla.; A. G. Fleischman, Des Moines, Iowa; John F. Patton, St. Louis; Otto J. Wilhelmi, St. Louis; Hermon C. Bumpus Jr., Pasadena, Calif.; Charles J. McDevitt, Cincinnati; Gershom J. Thompson, Rochester, Minn., and N. G. Alcock, Iowa City.

Dr. Vincent J. O'Connor, Chicago, read a paper on "Intraprostatic Injection: An Experimental Study by Vincent O'Connor and Robert L. Ladd." Discussed by Drs. Earl Ewert, Chicago, and Vincent J. O'Connor, Chicago.

#### FRIDAY, MAY 15—AFTERNOON

The following officers were elected: chairman, Henry W. E. Walther, New Orleans; vice chairman, Nelse F. Ockerblad, Kansas City, Mo.; secretary, William P. Herbst Jr., Washington, D. C.; delegate, Hermon C. Bumpus Jr., Pasadena, Calif.; executive committee, John H. Morrissey, New York; Stanley R. Woodruff, Jersey City, N. J., and Henry W. E. Walther, New Orleans.

The following papers were read as a symposium on "Sterility."

Dr. Richard Chute, Boston: "Endocrine Factors in Sterility." Discussed by Drs. Moses Swick, New York, and Richard Chute, Boston.

Dr. Samuel R. Meaker, Boston: "The Gynecologic Aspect of Human Sterility."

Dr. Robert S. Hotchkiss, New York: "Methods of Sperm Analysis, with the Valuation of Therapeutic Procedures."

Dr. Francis R. Hagner, Washington, D. C.: "Plastic Operative Treatment for Relief of Sterility in the Male."

These three papers were discussed by Drs. Victor D. Lespinasse, Chicago; Lawrence R. Wharton, Baltimore; Miley B. Wesson, San Francisco; J. H. Turner, Houston, Texas; Samuel R. Meaker, Boston; Robert S. Hotchkiss, New York, and Francis R. Hagner, Washington, D. C.

Dr. Jesse Ullman Reaves, Mobile, Ala., read a paper on "Granuloma Inguinale vs. Lymphogranuloma Inguinale." Discussed by Drs. H. T. Hayes, Houston, Texas; J. H. Turner, Houston, Texas; Max S. Wien, Chicago; Paul R. Stalnaker, Houston, Texas; Victor D. Lespinasse, Chicago, and Jesse Ullman Reaves, Mobile, Ala.

Dr. M. A. Nicholson, Duluth, Minn., read a paper on "Analysis of Indications for and Results of Cystoscopic Examination." Discussed by Dr. R. W. Barnes, Los Angeles.

#### SECTION ON ORTHOPEDIC SURGERY

##### WEDNESDAY, MAY 13—AFTERNOON

The meeting was called to order at 2:05 by the chairman, Dr. Arthur T. Legg, Boston.

Dr. J. Albert Key, St. Louis, read a paper on "Results Obtained by the Subcutaneous Fixation of Fractures of the Neck of the Femur." Discussed by Drs. Edwin W. Ryerson, Chicago; Fred Knowles, Fort Dodge, Iowa; Fred J. Gaenslen, Milwaukee; Kellogg Speed, Chicago, and J. Albert Key, St. Louis.

Dr. Joseph I. Mitchell, Memphis, Tenn., read a paper on "Fractures of the Neck of the Femur in Children." Discussed by Drs. Paul C. Colonna, New York; S. L. Haas, San Francisco; Ralph G. Carothers, Cincinnati, and Joseph I. Mitchell, Memphis, Tenn.

Dr. Paul B. Magnuson, Chicago, read a paper on "The Evaluation of the Various Methods of Treatment Advanced for Fractures of the Neck of the Femur." Discussed by Drs.

Frank D. Dickson, Kansas City, Mo.; Willis C. Campbell, Memphis, Tenn.; C. Fred Ferciot, Lincoln, Neb.; J. Albert Key, St. Louis; Laurence Jones, Kansas City, Mo., and Paul Magnuson, Chicago.

Dr. Albert B. Ferguson, New York, read a paper on "A New Lateral Roentgenogram of the Femoral Neck." Discussed by Drs. Fred J. Gaenslen, Milwaukee; S. Perry Rogers, Chicago, and Albert B. Ferguson, New York.

Dr. Arthur T. Legg, Boston, read the chairman's address, entitled "The Early Orthopedic Treatment of Poliomyelitis."

Dr. Fred H. Albee, New York, read a paper on "Massive Resection and Bone Graft Replacement in Sarcoma of the Long Bone." Discussed by Dr. Arthur Steindler, Iowa City.

#### THURSDAY, MAY 14—AFTERNOON

Dr. Marcus H. Hobart, Evanston, Ill., read a paper on "Osteomyelitis at Cook County Hospital, with an Appraisal of Orr's Treatment." Discussed by Drs. R. J. Dittrich, Fort Scott, Kan.; Jacob Kulowski, St. Joseph, Mo.; J. E. M. Thomson, Lincoln, Neb.; Edwin W. Ryerson, Chicago; John Prentiss Lord, Omaha, and Marcus H. Hobart, Evanston, Ill.

Dr. Carl E. Badgley, Ann Arbor, Mich., read a paper on "Osteomyelitis of the Ilium, Acute and Chronic." Discussed by Drs. W. B. Carrell, Dallas, Texas, and Carl E. Badgley, Ann Arbor, Mich.

Dr. Guy A. Caldwell, Shreveport, La., read a paper on "Osteomyelitis of the Spine." Discussed by Dr. M. E. Pusitz, Topeka, Kan.

Dr. Robert C. Robertson, Chattanooga, Tenn., read a paper on "Acute Hematogenous Osteomyelitis: An Analysis of Seventy-Five Cases." Discussed by Drs. Edwin W. Ryerson, Chicago; Joseph I. Mitchel, Memphis, Tenn.; Robert L. Preston, New York; James B. Weaver, Kansas City, Mo., and Robert C. Robertson, Chattanooga, Tenn.

Drs. John C. Wilson and Francis M. McKeever, Los Angeles, presented a paper on "Growth Changes in Bone as a Result of Osteomyelitis in Children." Discussed by Dr. D. B. Phemister, Chicago.

Dr. Sylvan L. Haas, San Francisco, read a paper on "Late Infection Following the Use of Wire and Pins in Bone." Discussed by Drs. Roger Anderson, Seattle; W. K. West, Oklahoma City, and Sylvan L. Haas, San Francisco.

#### FRIDAY, MAY 15—AFTERNOON

The following officers were elected: chairman, Dr. Fremont A. Chandler, Chicago; vice chairman, Dr. John Dunlop, Pasadena, Calif.; secretary, Dr. Robert V. Funsten, University, Va.; delegate, Dr. Henry W. Meyerding, Rochester, Minn.; alternates: Drs. Roland Hammond, Providence, R. I.; James S. Speed, Memphis, Tenn.; executive committee: Drs. Robert D. Schrock, Omaha; Arthur T. Legg, Boston; Fremont A. Chandler, Chicago.

Dr. Fremont A. Chandler, Chicago, was continued as a member of the American Board of Orthopedic Surgery.

The report of the secretary was given by Dr. Robert V. Funsten and was adopted.

Dr. Joseph S. Barr, Boston, read a paper on "Tuberculosis of the Hip in Children." Discussed by Drs. Arthur Steindler, Iowa City; John C. Wilson, Los Angeles; Halford Hallock, New York, and Joseph S. Barr, Boston.

Dr. Melvin S. Henderson, Rochester, Minn., read a paper on "The Massive Bone Graft." Discussed by Drs. Oscar L. Miller, Charlotte, N. C.; Fremont A. Chandler, Chicago; W. K. West, Oklahoma City, and Melvin S. Henderson, Rochester, Minn.

Drs. Samuel Kleinberg and Joseph Buchman, New York, presented a paper on "The Operative versus the Manipulative Treatment of Slipped Femoral Epiphysis, with a Description of a Curative Operation." Discussed by Dr. Samuel Kleinberg, New York.

Drs. Louis B. Laplace and Jesse T. Nicholson, Philadelphia, presented a paper on "The Physiologic Effects of the Correction of Faulty Posture." Discussed by Dr. John G. Kuhns, Boston.

Dr. Arthur G. Davis, Erie, Pa., read a paper on "A Conservative Treatment of Habitual Dislocations of the Shoulder." Discussed by Drs. Edson B. Fowler, Evanston, Ill., and Arthur G. Davis, Erie, Pa.

## SECTION ON GASTRO-ENTEROLOGY AND PROCTOLOGY

WEDNESDAY, MAY 13—MORNING

The meeting was called to order at 9 o'clock by the chairman, Dr. Ernest H. Gaither, Baltimore.

The chairman read the following letter from Dr. Anthony Bassler, New York:

Nov. 20, 1935.

At the next meeting of the section, please submit the following. After its adoption kindly send me the name of the person who is selected.

A suitable resolution would be:

The International Society of Gastro-Enterology is forming an American committee to select and communicate with those who are to be the members from this country. The committee is being made up by representatives of the various gastro-enterologic organizations in the United States. Among these is the Section on Gastro-Enterology and Proctology of the American Medical Association. Thus far those on the committee request the section to select and appoint a representative to this committee, if possible one who is not a member of other gastro-enterologic organizations.

On motion made by Dr. Louis J. Hirschman, Detroit, seconded by Dr. Descum C. McKenney, Buffalo, it was voted that for clarification the matter be referred through the section delegate, Dr. Curtice Rosser, Dallas, Texas, to the House of Delegates of the American Medical Association, for information and report back on Friday morning, May 15, since the invitation was issued to a constituent part of the American Medical Association.

Dr. Descum C. McKenney, Buffalo, read a paper on "Multiple Polyposis of Colon, Familial Factor and Malignant Tendency." Discussed by Drs. John J. Corbett, Detroit; Thomas E. Jones, Cleveland, and Descum C. McKenney, Buffalo.

Drs. Charles W. Mayo and E. G. Wakefield, Rochester, Minn., presented a paper on "Disseminated Polyposis of the Colon." Discussed by Drs. Frank H. Lahey, Boston; Walter A. Fansler, Minneapolis; H. W. Soper, St. Louis, and E. G. Wakefield, Rochester, Minn.

Dr. H. W. Soper, St. Louis, read a paper on "Clinical Significance of Indicanuria." Discussed by Drs. A. L. Levin, New Orleans; H. W. Soper, St. Louis, and E. G. Wakefield, Rochester, Minn.

Dr. Nelson G. Russell, Buffalo, read a paper on "The Relation of Gastro-Enterology to General Medicine." Discussed by Drs. George B. Eustermann, Rochester, Minn., and Nelson G. Russell, Buffalo.

Drs. Russell S. Boles and Jefferson H. Clark, Philadelphia, presented a paper on "Alcohol and Cirrhosis of the Liver: Clinical and Pathologic Considerations." Discussed by Drs. Leonard G. Rowntree, Philadelphia; Harry L. Bockus, Philadelphia, and Russell S. Boles, Philadelphia.

Drs. David R. Meranze and Maurice M. Rothman, Philadelphia, presented a paper on "The Relationship of the Plasma Phosphatase Value in the Blood in the Differential Diagnosis of Obstructive and Hepatocellular Jaundice." Discussed by Drs. Leonard G. Rowntree, Philadelphia; J. Russell Twiss, New York, and Maurice M. Rothman, Philadelphia.

Drs. Harry L. Bockus and Henry J. Tumen, Philadelphia, presented a paper on "Serum Proteins in Hepatic Diseases." Discussed by Dr. Manfred W. Comfort, Rochester, Minn.

#### THURSDAY, MAY 14—MORNING

Dr. Ernest H. Gaither, Baltimore, read the chairman's address, entitled "Recent Advances in Gastro-Enterology."

Drs. Rudolf Schindler, Marie Ortmayer and John F. Renshaw, Chicago, presented a paper on "Chronic Gastritis." Discussed by Drs. William Carpenter MacCarty, Rochester, Minn.; Leon Bloch, Chicago; George B. Eusterman, Rochester, Minn., and Rudolf Schindler, Chicago.

Dr. Warren T. Vaughan, Richmond, Va., read a paper on "The Leukopenic Index as a Diagnostic Method in the Study of Food Allergy." Discussed by Drs. L. P. Gay, St. Louis; Herbert J. Rinkel, Kansas City, Mo.; Albert H. Rowe, Oakland, Calif., and Warren T. Vaughan, Richmond, Va.

Drs. C. C. Tucker and C. A. Hellwig, Wichita, Kan., presented a paper on "The Etiology of Pruritus Ani: Clinical and Histologic Manifestations in Forty-Three Cases." Discussed by Drs. Harry E. Bacon, Philadelphia; Curtice Rosser, Dallas, Texas; Hamilton Montgomery, Rochester, Minn.; Louis J. Hirschman, Detroit; Victor C. Tucker, San Antonio, Texas; G. S. Hanes, Louisville, Ky., and C. C. Tucker, Wichita, Kan.

Dr. Marion C. Pruitt, Atlanta, Ga., read a paper on "The Surgical Treatment of Pruritus Ani." Discussed by Drs. Harvey B. Stone, Baltimore; Louis J. Hirschman, Detroit; G. S. Hanes, Louisville, Ky., and Marion C. Pruitt, Atlanta.

Dr. George B. Eusterman, Rochester, Minn., read a paper on "The Clinical Significance of Negative Roentgen Examinations in Patients with Chronic Dyspepsia." Discussed by Drs. Edward H. Skinner, Kansas City, Mo., Nelson G. Russell, Buffalo, and Rudolf Schindler, Chicago.

#### FRIDAY, MAY 15—MORNING

The following officers were elected: chairman, Dr. Louis A. Buie, Rochester, Minn.; vice chairman, Dr. Harry L. Bockus, Philadelphia; secretary, Dr. A. H. Aaron, Buffalo; executive committee: Dr. Walter A. Fansler, Minneapolis; Dr. Ernest H. Gaither, Baltimore, and Dr. Louis A. Buie, Rochester, Minn. Delegate, Dr. Curtice Rosser, Dallas, Texas; alternate, Dr. Frank G. Runyeon, Reading, Pa.; chairman of Committee on Section Exhibit, Dr. J. Arnold Bagen, Rochester, Minn.

Dr. Curtice Rosser, Dallas, Texas, made his report as delegate to the House of Delegates. On motion made by Dr. Louis A. Buie, Rochester, Minn., seconded by Dr. Bernard Sachs, Omaha, it was voted to accept the report.

On motion made by Dr. Curtice Rosser, Dallas, seconded by Dr. Sara M. Jordan, Boston, the following resolution was adopted:

WHEREAS, The International Society of Gastro-Enterology is forming an American committee to select and communicate with those who are to be the members from this country, and this committee is being made up by representatives of the various gastro-enterologic organizations in the United States, among these being the Section on Gastro-Enterology and Proctology of the American Medical Association, and those on the committee having requested the section to select and appoint a representative to this committee; it is hereby

Resolved, That this section, through its present chairman, appoint such a representative.

Dr. Henry A. Rafsky, New York, was appointed a member of the American Committee of the International Society of Gastro-Enterology, in accordance with the foregoing resolution.

On motion made by Dr. Russell S. Boles, Philadelphia, seconded by Dr. Louis A. Buie, Rochester, Minn., it was voted to reimburse Dr. A. F. R. Andresen, Brooklyn, for one half of his expenses in connection with the establishment of the American Board of Gastro-Enterology.

On motion made by Dr. A. F. R. Andresen, Brooklyn, seconded by Dr. Sidney A. Portis, Chicago, and many others, it was voted that the secretary send to Dr. Frank Smithies, Chicago, the greetings of the section, an expression of appreciation for all he has done for medicine, gastro-enterology and the Section on Gastro-Enterology and Proctology of the American Medical Association, and wishing him a speedy recovery.

Dr. Louis J. Hirschman, Detroit, read a paper on "The Importance of Routine Examination of the Colon." Discussed by Dr. Descum C. McKenney, Buffalo.

Dr. Samuel Morein, Providence, R. I., read a paper on "Diaphragmatic Hernia: Symptomatology, Diagnosis and Treatment." Discussed by Drs. I. R. Jankelson, Boston; Harry A. Singer, Chicago, and Samuel Morein, Providence, R. I.

Dr. Sara M. Jordan, Boston, read a paper on "A Review of the Gastric Ulcer Problem." Discussed by Drs. Russell S. Boles, Philadelphia; Sidney A. Portis, Chicago; Henry A. Rafsky, New York; Walter L. Palmer, Chicago; William Carpenter MacCarty, Rochester, Minn., and Sara M. Jordan, Boston.

Dr. Frank D. Gorham, St. Louis, read a paper on "Treatment of Intractable Peptic Ulcer by Intramuscular Injections of Metallic Bismuth."

Dr. David J. Sandweiss, Detroit, read a paper on "Comparative Value of Dietetic, Surgical and Parenteral Treatment in Peptic Ulcer."

These two papers were discussed by Drs. A. F. R. Andresen, Brooklyn; Sara M. Jordan, Boston; George B. Eusterman, Rochester, Minn.; Italo F. Volini, Chicago; Russell S. Boles, Philadelphia, and John H. Fitzgibbon, Portland, Ore.

Dr. G. V. Brindley, Temple, Texas, read a paper on "Carcinoma of the Rectum: Factors Affecting Its Cure." Discussed by Drs. Curtice Rosser, Dallas, Texas; Fred W. Rankin, Lexington, Ky., and G. V. Brindley, Temple, Texas.

Dr. J. W. Thompson, St. Louis, read a paper on "Secondary Resections in Recurring Carcinoma of the Colon." Discussed by Drs. C. J. Hunt, Kansas City, Mo., and C. F. Dixon, Rochester, Minn.

## SECTION ON RADIOLOGY

WEDNESDAY, MAY 13—MORNING

The meeting was called to order at 8:55 by the chairman, Dr. Edward L. Jenkinson, Chicago.

Dr. Albert Soiland, Los Angeles, delegate from the section to the House of Delegates of the American Medical Association, read the following report of the Reference Committee on Sections and Section Work:

With respect to the resolution presented by Dr. Albert Soiland, of the Section of Radiology, and adopted by the Section on Radiology, as follows:

WHEREAS, The answers published in the Department of Queries and Minor Notes of THE JOURNAL of the AMERICAN MEDICAL ASSOCIATION, being unsigned, are readily construed as representing the official opinion of the American Medical Association, thus giving them a standing and authority which would otherwise not obtain; and

WHEREAS, The answers are obviously on occasion merely the expression of individual opinion and should be interpreted in the light of that fact; and

WHEREAS, Without such interpretation the answers are misleading and deceptive and capable of working a serious injustice to many who may hold opinions at variance with those expressed; therefore be it

Resolved, That the Section on Radiology of the American Medical Association recommends to the House of Delegates that appropriate steps be taken to make plain to the casual readers of THE JOURNAL the status of and responsibility for the answers published in the Department of Queries and Minor Notes.

Your committee is reliably informed that the Department of Queries and Minor Notes of THE JOURNAL is one of the most popular features of our official organ, eagerly consulted by the rank and file of our membership. Your committee is further informed that the answers to questions appearing in this section of THE JOURNAL are furnished by a group of outstanding men selected because of their familiarity with the particular problems raised by the questioner. Notwithstanding, your committee, after consultation with the editor of THE JOURNAL, recommends that in the future there be inscribed at the head of this section of THE JOURNAL a statement setting forth that the answers given to the queries, although believed to be scientifically accurate, do not represent the consensus of any official body of the Association, unless so stated in the answer.

Dr. Soiland read the following report of the Reference Committee on Medical Education, regarding resolutions of Drs. F. F. Borzell, Philadelphia, and Albert Soiland, Los Angeles, regarding the practice of radiology and its division into professional and technical services and the resolution of the California Medical Association regarding other technical and professional services:

We recommend as follows:

1. We reiterate the principle enunciated by the House of Delegates at Cleveland in 1934 "that the practice of radiology, whether for diagnostic or therapeutic purposes, constitutes the practice of medicine." The action of the House of Delegates in 1925 establishing a section on radiology confirms this principle.

2. We further recommend that all services connected with the practice of radiology be under the direct control and supervision of the medical profession, and this same principle pertains to other technical and professional services.

Dr. Edward L. Jenkinson, Chicago, read the chairman's address, entitled "Cholecystography."

The following papers were read as a "Gastro-Intestinal Symposium":

Dr. Hollis E. Potter, Chicago: "The Use of Pressure Devices in X-Ray Diagnosis of Peptic Ulcer."

Drs. William J. Hoffman and George T. Pack, New York: "Cancer of the Duodenum: A Clinical and Radiologic Study of Sixteen Cases."

Dr. E. P. Pendergrass, Philadelphia: "Some Observations on the Physiology and Pathology of the Small Intestine."

Dr. James T. Case, Chicago: "Comparison of Methods of Roentgen Examinations of the Colon."

These four papers were discussed by Drs. B. R. Kirklin, Rochester, Minn.; Harry M. Weber, Rochester, Minn.; E. V. Powell, Temple, Texas; Ross Golden, New York; Hollis E. Potter, Chicago, and James T. Case, Chicago.

Drs. Sherwood Moore and Wendell G. Scott, St. Louis, presented a paper on "Roentgenkymography: Its Clinical and

Physiologic Value in Diseases of the Heart and Chest." Discussed by Dr. M. C. Sosman, Boston.

#### THURSDAY, MAY 14—MORNING

Dr. Wilbur Bailey, Los Angeles, read a paper on "Anomalies and Fractures of the Vertebral Articular Processes."

Dr. W. Warner Watkins, Phoenix, Ariz., read a paper on "Bony Anomalies in Wrist and Foot."

These two papers were discussed by Drs. Arthur Steindler, Iowa City; Fremont A. Chandler, Chicago; Leo G. Rigler, Minneapolis; Wilbur Bailey, Los Angeles, and W. Warner Watkins, Phoenix, Ariz.

The following papers were read as a symposium on "Lymph Gland Pathology":

Dr. Plinn F. Morse, Detroit: "Classification of Lymph Node Enlargements."

Dr. B. K. Wiseman, Columbus, Ohio: "The Character and Significance of the Blood Picture in the Lymphadenopathies."

Dr. F. W. O'Brien, Boston: "The Roentgen Treatment of the So-Called Malignant Lymphomas."

Dr. Leo G. Rigler, Minneapolis: "Leukemia of the Stomach Producing Hypertrophy of the Gastric Mucosa."

These four papers were discussed by Drs. Ross Golden, New York; Israel Davidsohn, Chicago; B. K. Wiseman, Columbus, Ohio, and F. W. O'Brien, Boston.

#### FRIDAY, MAY 15—MORNING

The following officers were elected: chairman, Dr. Ross Golden, New York; vice chairman, Dr. B. R. Kirklin, Rochester, Minn.; secretary, Dr. John T. Murphy, Toledo, Ohio; executive committee: Dr. John W. Pierson, Baltimore; Dr. Edward L. Jenkinson, Chicago; Dr. Ross Golden, New York; delegate, Dr. E. H. Skinner, Kansas City, Mo.; alternate, John W. Pierson, Baltimore; member of the Board of Radiology, Dr. Lyell C. Kinney, San Diego, Calif.; delegate to the fifth International Congress of Radiology, Dr. W. F. Manges, Philadelphia; alternate, Dr. John T. Murphy, Toledo, Ohio.

It was moved that the House of Delegates of the American Medical Association be petitioned to permit the Section on Radiology to form a committee for the purposes of classifying hospitals as to their departments of radiology. The motion was lost for want of a second.

Dr. James F. Kelly, Omaha, read a paper on "The Present Status of the X-Rays as an Aid in the Treatment of Gas Gangrene." Discussed by Drs. E. H. Skinner, Kansas City, Mo.; John J. Faust, Tyler, Texas; W. Warner Watkins, Phoenix, Ariz., and James F. Kelly, Omaha.

Drs. Fred M. Hodges and R. A. Berger, Richmond, Va., presented a paper on "Roentgen Therapy of Some Acute, Sub-

acute and Chronic, More or Less Localized Infections." Discussed by Drs. Edward H. Skinner, Kansas City, Mo.; F. F. Borzell, Philadelphia; J. James Duffy, Denison, Iowa; L. R. Sante, St. Louis; W. Edward Chamberlain, Philadelphia; Leo G. Rigler, Minneapolis; Rollin H. Stevens, Detroit; William H. Sargent, Oakland, Calif., and R. A. Berger, Richmond, Va.

Drs. J. Cash King and Leo C. Harris Jr., Memphis, Tenn., presented a paper on "Cystic Disease of the Lung." Discussed by Drs. L. R. Sante, St. Louis; James L. Dubrow, Des Moines, Iowa; Carleton B. Peirce, Ann Arbor, Mich.; Leo G. Rigler, Minneapolis, and J. Cash King, Memphis, Tenn.

Dr. Robert P. Ball, Chattanooga, Tenn., read a paper on "Needle (Aspiration) Biopsy of Bone Lesions." Discussed by Dr. Harold G. F. Edwards, Shreveport, La.

Drs. Carleton B. Peirce and Isadore Lampe, Ann Arbor, Mich., presented a paper on "Giant Cell Bone Tumor: Further Observations on the Response to Surgical and Radiation Therapy."

### SECTION ON MISCELLANEOUS TOPICS Session on Tuberculosis

#### WEDNESDAY, MAY 13—AFTERNOON

The meeting was called to order at 2 o'clock by the chairman, Dr. James Alexander Miller, New York, who stated that the session was being held as an experiment to determine the demand felt by the members for having a special section of the American Medical Association on tuberculosis.

Dr. James Alexander Miller, New York, read the chairman's address, entitled "Resistance in Tuberculosis."

Dr. Max Pinner, Oneonta, N. Y., read a paper on "Pathogenesis of Tuberculosis."

These two papers were discussed by Drs. Henry C. Sweany, Chicago; F. M. Pottenger Sr., Monrovia, Calif.; James Alexander Miller, New York, and Max Pinner, Oneonta, N. Y.

Dr. J. Burns Amberson Jr., New York, read a paper on "Case Finding Methods and Early Diagnosis in Tuberculosis." Discussed by Drs. George H. Hoxie, Kansas City, Mo.; William Devitt, Allenwood, Pa.; Sam H. Snider, Kansas City, Mo.; H. I. Spector, St. Louis, and J. Burns Amberson Jr., New York.

Dr. Le Roy S. Peters, Albuquerque, N. M., read a paper on "Sanatorium Care of the Tuberculous." Discussed by Drs. A. M. Forster, Colorado Springs, Colo.; C. M. Hendricks, El Paso, Texas (read by Secretary Charles H. Cocke, Asheville, N. C.), and Victor Strong Randolph, Phoenix, Ariz.

Dr. J. J. Singer, St. Louis, read a paper on "Collapse Therapy in Pulmonary Tuberculosis." Discussed by Drs. J. W. Cutler, Philadelphia; O. E. Egbert, El Paso, Texas, and J. J. Singer, St. Louis.

## THE SCIENTIFIC EXHIBIT

The Scientific Exhibit at the Kansas City session was characterized by the devotion with which the demonstrators in the various booths remained at their tasks under difficult circumstances and the continuous and sustained interest shown by the ever present crowds in the aisles. There were 150 exhibits prepared by individuals under the auspices of the various sections of the Scientific Assembly; twenty exhibits in the Educational Classification were prepared by national organizations and government agencies; there were four exhibits from the headquarters of the American Medical Association and two special exhibits subsidized by the Board of Trustees.

The special exhibit on diabetes was presented under the auspices of the following committee: E. P. Joslin, chairman, Boston; Charles H. Best, Toronto; Louis I. Dublin, New York; Ralph H. Major, Kansas City, Mo.; Howard F. Root, Boston; Bernard Smith, Los Angeles, and Russell M. Wilder, Rochester, Minn., with the assistance of Cecil Striker, Shields Warren, Alexander Marble and C. N. H. Long. In addition, thirty-four physicians gave short talks on the subject of diabetes in a room adjoining the exhibits, where also motion pictures on diabetes were shown at various intervals during the week.

The special exhibit on fractures was presented under the auspices of a committee consisting of Kellogg Speed, chairman,

Chicago; Frank D. Dickson, Kansas City, Mo., and Walter Estell Lee, Philadelphia, assisted by an advisory committee consisting of Isidore Cohn, New Orleans; H. Earle Conwell, Birmingham, Ala.; Frederic J. Cotton, Boston; William Darach, New York; Richard B. Dillehunt, Portland, Ore.; Eldridge L. Eliason, Philadelphia; Leo Eloesser, San Francisco; George W. Hawley, Bridgeport, Conn.; Melvin S. Henderson, Rochester, Minn.; James M. Hitzrot, New York; William L. Keller, Washington, D. C.; Roy D. McClure, Detroit; Frank R. Ober, Boston; Dallas B. Phemister, Chicago; J. Spencer Speed, Memphis, Tenn., and John C. Wilson, Los Angeles. Fifty-two physicians from various parts of the country assisted with the demonstrations. Acknowledgment is made to the Surgeon General of the United States Army and to Col. E. M. Blanchard and men from Station Hospital, Kansas City, for the very efficient service which they rendered in connection with the fracture exhibit. Appreciation is also expressed to the management of St. Luke's Hospital, Kansas City, for the cooperation rendered in furnishing nurses and supplies for the exhibit.

Other features of the Kansas City session included a small group of exhibits on traffic accidents, stressing especially emer-

agency treatment; a group of fifteen exhibits from the University of Kansas School of Medicine, presenting a wide range of subjects, and motion picture programs by the Section on Ophthalmology and by the Section on Orthopedic Surgery, shown in spaces adjoining the exhibits of those two sections.

## REPORT OF THE COMMITTEE ON AWARDS

The Committee on Awards made the following report:

### CLASS I

[Awards in Class I are made for exhibits of individual investigation, which are judged on the basis of originality and excellence of presentation.]

The gold medal to Charles B. Huggins, W. J. Noonan and B. H. Blocksom, Department of Surgery, University of Chicago, Chicago, for original investigation on the distribution of red and yellow bone marrow and the reticulo-endothelial system in the bone marrow.

The silver medal to G. C. Supplee and S. Ansbacher, Research Division, The Borden Company, New York, for original investigations on the development of pure lactoflavin, an entity of the water soluble vitamin B complex.

The bronze medal to Alvan L. Barach, Presbyterian Hospital, New York, for original investigations on the rôle of helium and oxygen in various types of dyspnea.

Certificates of merit, Class I, are awarded to the following (alphabetically arranged):

Arthur F. Abt, Chester J. Farmer and Elizabeth Smith, Northwestern University Medical School, Chicago, for exhibit illustrating the metabolism of cevitamic acid of infants and children.

Frederic A. Gibbs, William G. Lennox, Hallowell Davis, Erna L. Gibbs and Albert Grass, Harvard Medical School, Boston, for exhibit illustrating the electro-encephalograph and its application to the study of epilepsy.

Wendell G. Scott and Sherwood Moore, Edward Mallinckrodt Institute of Radiology, Washington University School of Medicine, St. Louis, for exhibit illustrating the clinical and physiologic value of kymography in diseases of the heart and chest.

Phillips Thygeson and Francis I. Proctor, University of Iowa, Iowa City, for exhibit illustrating the differential diagnosis of trachoma.

In addition, the following exhibits are deemed worthy of honorable mention (alphabetically arranged):

That of Archibald L. Hoyne, Municipal Contagious Disease Hospital, Board of Health and Cook County Hospital, Chicago, and N. S. Ferry, Parke, Davis and Company, Detroit, for an exhibit on meningococcus antitoxin in the treatment of epidemic meningitis.

That of H. O. Mahoney and Barry J. Anson, Northwestern University Medical School, Chicago, for an exhibit illustrating a radiographic study of anatomic sections.

That of O. H. Robertson and W. D. Sutliff, Department of Medicine, University of Chicago, Chicago, for an exhibit illustrating the results of a clinical and experimental study of the lesion of lobar pneumonia.

### CLASS II

[Awards in Class II are made for exhibits which do not exemplify purely experimental studies and which are judged on the basis of excellence of presentation.]

The gold medal to Rudolf Schindler, Marie Ortmyer and John F. Renshaw, University of Chicago, Chicago, for excellence of presentation of an exhibit on chronic gastritis as studied by gastroscopy.

The silver medal to John O. Bower, J. C. Burns and H. A. Mengle, Department of Research Surgery, Temple University School of Medicine and General Hospital, Philadelphia, for an exhibit illustrating the treatment of spreading peritonitis complicating acute appendicitis.

The bronze medal to Hamilton Montgomery, Mayo Clinic, Rochester, Minn., for excellence of presentation of an exhibit illustrating the histopathology of various types of cutaneous tuberculosis.

Thirty-eight papers read before the various sections of the Scientific Assembly were also accompanied by material in the Scientific Exhibit, thus giving an opportunity to the individuals who had heard the papers to consult the authors and go over the work at leisure.

Certificates of merit, Class II, are awarded to the following (alphabetically arranged):

R. Russell Best, N. Frederick Hicken and Howard B. Hunt, Departments of Anatomy, Surgery and Roentgenology, University of Nebraska College of Medicine, Omaha, for excellence of presentation of an exhibit illustrating cholangiographic studies of the gallbladder and biliary ducts.

W. James Gardner, Neurosurgical Division, Cleveland Clinic, Cleveland, for excellence of presentation of an exhibit on hereditary brain tumors.

George Levene and Henry H. Lerner, Robert Dawson Evans Memorial for Clinical Research and Preventive Medicine, Massachusetts Memorial Hospitals, Boston, for excellence of presentation of an exhibit illustrating the roentgenoscopic appearance of the heart.

W. Eugene Wolcott, Des Moines, Iowa, for excellence of presentation of an exhibit illustrating circulation in the head and neck of the femur.

### HONORABLE MENTION

In addition, the following exhibits are deemed worthy of honorable mention (alphabetically arranged):

That of E. C. Hamblen and B. Carter, Department of Obstetrics and Gynecology, Duke University Hospital and School of Medicine, Durham, N. C., for an exhibit on studies of the endometrium in functional abnormalities of menstruation and its response to endocrine therapy.

That of Bayard T. Horton, George E. Brown (deceased) and Grace Roth, Mayo Foundation for Medical Education and Research, Rochester, Minn., for an exhibit on hypersensitiveness to cold.

A special certificate of merit is awarded to the New York State Institute for the Study of Malignant Diseases, Buffalo, for its exhibit on cancer.

In addition, the exhibit of the Advisory Board for Medical Specialties and of the American Society for the Control of Cancer are deemed worthy of honorable mention.

### SPECIAL COMMENDATIONS

Particular commendation is made of the remarkable exhibit by members of the Mayo Clinic, Rochester, Minn., on diseases of the thyroid gland.

Special commendation is also made of the exhibit by the University of Kansas School of Medicine; of the exhibit on undulant fever by the United States Public Health Service; of the exhibit on screw worm myiasis of man and animals by the Bureau of Entomology and Plant Quarantine of the United States Department of Agriculture; of the exhibit on color photography by the Army Medical Museum, Washington, D. C.

The Committee commends especially the many individual exhibitors who have developed exhibits from their own resources and have taken a constant and active part in demonstrating their exhibits to visitors.

### SPECIAL EXHIBITS (SUBSIDIZED)

The Committee on Awards particularly commends the special exhibits sponsored by the American Medical Association and expresses grateful appreciation to Dr. E. P. Joslin and his committee for the comprehensive exhibit and demonstrations on diabetes, and to Dr. Kellogg Speed and his committee for the instructive exhibit on fractures with practical demonstrations.

### RECOMMENDATIONS

The Committee on Awards believes that the method of correlating the Scientific Exhibit with the Scientific Assembly by the appointment of section exhibit representatives is of advantage and should be continued.

The Committee appreciates the difficulties encountered in securing proper accommodations for the Scientific Exhibit; it ventures to recommend, however, that special consideration be given to this problem in future years so that sufficient space may be available to accommodate the increasing number of physicians who visit the exhibit and so that a suitable environment may be secured which will be in keeping with the high standard of the exhibits.

The Committee recommends to the Committee on Scientific Exhibit that the present gold medal be known as the Billings Medal and that other medals be designed for the various awards to be known by definite names.

The Committee believes that the American Medical Association owes a debt of gratitude to the Committee on Scientific

Exhibit of the Board of Trustees, to the Advisory Committee, and to Dr. Thomas G. Hull, director in charge of the Scientific Exhibit.

The Committee cannot commend too highly the arrangements, general and special, the efficient management, the instructiveness and the scientific as well as practical value of the exhibit. The exhibitors, in many cases at personal sacrifice, present exhibits prepared by modern methods and devices for the illustration of recent advances in the various fields of medicine.

LUDVIG HEKTOEN, Chairman, Chicago.

A. H. AARON, Buffalo.

WALTER FREEMAN, Washington, D. C.

THOMAS PARRAN JR., Washington, D. C.

W. W. WASSON, Denver.

## RESULTS OF THE GOLF TOURNAMENT

Two hundred and nine medical golfers from all parts of the United States played the interesting Mission Hills and the Kansas City Country Club courses in Kansas City on the occasion of the twenty-second annual tournament of the American Medical Golfing Association, Monday, May 11. Most of the entrants played thirty-six holes, enjoying eighteen over one course in the morning and the second round over the other links in the afternoon. Perfect weather was scored and all records were broken with a maximum attendance, greatest number of prizes and lowest championship scores. The 110 trophies and prizes were awarded after the golfers' dinner at Mission Hills club house, presided over by Dr. M. M. Cullom of Nashville, Tenn., president of the A. M. G. A. Dr. Clarence Capell of Kansas City, chairman of the golf committee, made the presentations. Speakers at the banquet included Drs. Logan-Clendening of Kansas City and Ernest Kelley of Omaha.

### DR. ROY EMANUEL OF OKLAHOMA IS CHAMPION

The championship was won by Dr. Roy Emanuel of Chickasha, Okla., who turned in an 82-74—156 for the thirty-six holes. He received the famous Will Walter Trophy, named in honor of the organizer and dean of the A. M. G. A. The Handicap Championship was won by Dr. W. C. Scheidt of Celina, Ohio, who bagged the Detroit Trophy, presented by the Detroit hosts in 1916. The Eighteen Hole Championship went to Dr. F. T. Gallagher of Cleveland, who took home the Golden State Trophy; the second prize in this event was won by Dr. W. L. Sucha of Omaha, the third prize by Dr. E. F. DeVilbiss of Kansas City, the fourth prize by Dr. D. W. Darwin of Woodward, Okla., and the fifth prize by Dr. W. J. Woolston of Pasadena, Calif. The Eighteen Hole Handicap Championship was awarded to Dr. C. B. Voigt of Mattoon, Ill., who won the Ben Thomas Trophy, the second prize to Dr. S. B. Berkley of Canton, Ohio, the third prize to Dr. J. J. Ryan of St. Paul, the fourth prize to Dr. W. R. Clinton of Detroit, the fifth prize to Dr. C. N. Linquist of Kansas City and the sixth prize to Dr. Henry Harkins of Chicago.

### DRS. CANTRELL AND NICOLL ARE TROPHY WINNERS

The Maturity Event, limited to Fellows over 60 years of age, for the best net score on the first eighteen holes was won by Dr. C. D. Cantrell of Kansas City, who received the Minneapolis Trophy; the second prize went to Dr. J. A. Hendrick of Shreveport, La., the third prize to Dr. W. E. Baker of Des Moines, the fourth prize to Dr. M. M. Cullom of Nashville, the fifth prize to Dr. Walter J. Wilson of Detroit, the sixth prize to Dr. J. P. DeWitt of Canton, Ohio, the seventh prize to Dr. W. D. Black of St. Louis and the eighth prize to Dr. J. B. Sampsell of Van Wert, Ohio.

Dr. Homer K. Nicoll of Chicago, president of the A. M. G. A. in 1934, won the Old Guard Championship, awarded to past-presidents, and received the Wendell Phillips Trophy. Second prize went to Dr. E. G. Zabriskie of New York, president in 1931, and the third prize to Dr. Charles Lukens of Toledo, president in 1935.

### SIX FLIGHTS, GROSS AND NET

The Championship Flight low gross was won by Dr. L. W. Pumphrey of Pittsburgh, who gained the St. Louis Trophy. Other winners were Drs. W. F. Manges of Philadelphia, J. P.

Loudon of Yakima, Wash., J. L. Lattimore of Topeka, Paul Tipton of Omaha, G. R. Love of Oconomowoc, Wis., and H. T. Jones of Lawrence, Kan. The net prize in this flight went to Dr. D. A. Williams of Kansas City, who won the President's Trophy, a sterling silver pitcher presented by Dr. M. M. Cullom; other winners were Drs. J. D. Fouts of Dayton, J. J. Hovorka of Emporia, G. W. Underwood of Dallas, E. R. Dewese of Kansas City and R. P. Bell of Cleveland.

The First Flight gross winners were Drs. H. L. D. Kirkham of Houston, Texas, D. H. Houston of Seattle, H. M. Roberts of Kansas City, C. D. Snyder of Winfield, Kan., James Greenwood of Houston and Q. O. Gilbert of Oakland, Calif. First prize among the nets was the Chairman's Trophy, presented by Dr. Clarence Capell and won by Dr. O. A. Cowart of Bristow, Okla. Other prizes were won by Drs. E. M. Sutton of Salina, Kan., A. C. Smith of Wooster, Ohio, T. S. Finney of Wichita, W. K. Fast of Atchison, C. V. Edwards of Council Bluffs and F. E. Wrightman of Sabetha, Kan.

The Second Flight gross winners were Drs. D. E. Eggleston of Kingman, Kan., C. P. Rutledge of Shreveport, E. D. Maloney of Omaha, H. S. Browne of Ponca City, Okla., F. G. Mays of Washington, Mo., J. P. Brennan of Pendleton, Ore., and Joseph Hanson of Sarasota, Fla. Net prizes went to Drs. L. M. Otis of Celina, Ohio, O. E. Satter of Prairie du Chien, Wis., J. M. Shaw of Wichita and M. R. Haley of Dayton.

The Third Flight gross winners were Drs. H. A. Gestring of Kansas City, W. S. Larrabee of Tulsa, W. W. Gist of Kansas City, D. A. Duncan of Shreveport, Dan Hogan of Kansas City, J. W. Shirer of Pittsburgh and O. A. Brines of Detroit. Net winners in this flight were Drs. C. A. Nicoll of Panora, Iowa, J. W. Speelman of Pittsburgh, J. M. Lamme of Walsenburg, Colo., J. R. Ripton of Cleveland and P. H. Owens of Kansas City.

Fourth Flight gross winners were Drs. E. N. Gentry of Kansas City, J. J. Caveness of Oklahoma City, A. A. Olson of Wichita, W. J. Feehan of Kansas City, Kan., and H. M. Clark of Platte City, Mo. Winners of the net prizes were Drs. E. W. Shank of Dayton, L. A. O'Brien of Kansas City, E. T. Warren of Stuart, Iowa, J. A. McLaughlin of Greensburg, Kan., and H. L. Charles of Atchison, Kan.

Fifth Flight (net only) winners were Drs. W. J. Ryan of Duluth, J. R. Fowler of Spencer, Mass., E. E. Gingles of Onawa, Iowa, M. C. Green of Omaha, P. C. Quistgard of Kansas City and B. W. Rhamy of Fort Wayne, Ind.

### KICKERS' HANDICAP

The Blind Bogey, or Kickers' Handicap, was won by Dr. T. E. Hunt of Paris, Texas, who bagged the Milwaukee Trophy. Winners of the other prizes were Drs. J. E. Hutchinson of Denver, E. O. Baker of Wichita, W. R. Hornaday of Des Moines, L. L. Bresette of Kansas City, Kan., D. F. Byrd of Nashville, W. J. Harrison of Cheyenne, C. A. McGuire of Kansas City, Clayton Andrews of Lincoln, Neb., G. W. Jones of Clovis, N. M., and E. D. Ebright of Wichita.

The officers of the American Medical Golfing Association express thanks to the many friends of the association who helped make the Kansas City tournament such a notable suc-

cess. They are especially grateful to the Kansas City committee, who arranged all details so efficiently, and to the scores of prize donors, whose generosity is acknowledged.

#### ELECTION OF OFFICERS

Dr. W. Albert Cook of Tulsa, Okla., was elected president of the A. M. G. A. for the ensuing year; Dr. E. S. Edgerton, Wichita, was chosen first vice president and Dr. Clarence Capell of Kansas City second vice president. Dr. Cullom, retiring president, was made a member of the board of directors. The next tournament will be held in Atlantic City at the time of the 1937 annual session.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION, PUBLIC HEALTH, ETC.)

### ALABAMA

**Clinical Society Organized.**—Physicians from Mobile, Pensacola, Gulfport and Biloxi met in Mobile recently to organize the Gulf Coast Clinical Society. Dr. William R. Meeker, Mobile, was named chairman of the society and Dr. Mozart A. Lischkoff, Pensacola, secretary-treasurer. The society will hold its first clinical session in October.

### CALIFORNIA

**Hospital News.**—The federal government has appropriated \$60,000 to construct a special unit for Indians at Wish-iah Sanatorium, Auberry.

**Deaths from Cancer Increase.**—There were 8,435 cancer deaths registered in California in 1935 as compared with 7,971 in 1934, showing mortality rates, respectively, of 134.4 and 129.4 per hundred thousand of population. Cancer of the digestive tract and peritoneum was recorded in the deaths of 3,949 persons. Cancer of the uterus was second on the list, causing 921 deaths, while cancer of the breast was responsible for 863 deaths.

### COLORADO

**University News.**—Dr. Francis M. Pottenger, Monrovia, Calif., addressed a meeting at the University of Colorado School of Medicine, Denver, May 7, on "Physiological Approach to the Diagnosis and Treatment of Tuberculosis"; the lecture was given under the auspices of the recently inaugurated Phi Rho Sigma Lectureship.

**Society News.**—The Medical Society of the City and County of Denver was addressed, May 5, by Drs. George B. Kent and Atha Thomas on "Surgical Treatment of Thyroid Diseases" and "Difficult Fractures About the Ankle Joint" respectively. Dr. Clifford Lee Wilmoth, for several years a medical missionary in Ethiopia, gave an address on that country. Dr. Jesse W. White, Pueblo, discussed "Thyroid and Pregnancy" before the Pueblo County Medical Society, April 7. Dr. Nolie Mumey, Denver, discussed the history of medicine before the Larimer County Medical Society, May 6. Dr. Edward R. Phillips, Delta, discussed professional ethics before the Delta County Medical Society, April 24. Dr. Austin E. Miller was elected an honorary member of the society at this meeting; he now lives in McAllen, Texas.

### CONNECTICUT

**Dr. Long Named Successor to Professor Mendel.**—Dr. Cyril N. H. Long, director of the George S. Cox Medical Institute, University of Pennsylvania Hospital, Philadelphia, has been appointed professor of physiologic chemistry at Yale University School of Medicine, New Haven; he succeeds the late Lafayette B. Mendel as chairman of the laboratory of physiologic chemistry. Dr. Long graduated in 1928 from McGill University Faculty of Medicine. In 1932 he was made director of the Cox Institute. Dr. Long is well known for his research on the endocrine glands and on carbohydrate metabolism.

**Society News.**—At a meeting of the Tri-City Medical Society of Norwich, New London and Willimantic, recently, Dr. Richard B. Cattell, Boston, discussed "Management of

Surgical Diseases of the Colon and Rectum."—The New London County Medical Association was addressed April 2 by Dr. Charles F. Wilinsky, Boston, on the economic aspects of medicine. At a meeting of the radiologic section of the Connecticut State Medical Society in Hartford, April 9, a paper on "Roentgen Diagnosis of Regional Ileitis" was presented by Drs. Douglas J. Roberts and Ralph T. Ogden. Dr. George W. Corner, Rochester, N. Y., addressed the Yale Medical Society, May 13, in New Haven, on "The Hormone of the Corpus Luteum." He lectured, May 12, on "Medicine in the Poems of Chaucer."

**Health at Hartford.**—Telegraphic reports to the U. S. Department of Commerce from eighty-six cities with a total population of 37 million indicate that for the week ended May 23 the highest mortality rate (21.5) appears for Hartford, the rate for the group of cities as a whole being 11.7. The mortality rate for the corresponding period last year was 11.5 for Hartford and 11.6 for the group of cities as a whole. The annual rate for eighty-six cities for the twenty-one weeks of 1936 was 13.4 as against a rate of 12.5 for the corresponding period of the previous year. Caution should be used in the interpretation of these weekly figures, as they fluctuate widely. The fact that some cities are hospital centers for large areas outside the city limits or that they have a large Negro population may tend to increase the death rate.

### DISTRICT OF COLUMBIA

**Academy of Medicine Formed.**—The Academy of Medicine of Washington was organized at a meeting, April 28, "for the advancement of the science of medicine and to promote the mutual exchange of knowledge between medical and other scientific groups." Membership is limited to sixty ordinary resident members and thirty associate and nonresident members and is nonmedical as well as medical in the sense that no special emphasis has been given to the medical degree as compared with the doctor's degree in one of the medical or allied sciences. Since the academy will draw its membership from all medical and associated scientific groups, it will serve as a forum for exchange of ideas and discussion of problems of general interest in medical science. Officers are Dr. William A. White, president; Carl Voegtlin, Ph.D., vice president; Dr. William C. White, treasurer, and Dr. Errett C. Albritton, secretary. Directors are Dr. Aleš Hrdlička, Dr. Sterling Ruffin, Lyman J. Briggs, Ph.D., Dr. Earl B. McKinley and Dr. Matthew W. Perry.

### FLORIDA

**State Medical Election.**—Dr. Edward Jelks, Jacksonville, was chosen president-elect of the Florida Medical Association at its recent annual session aboard the S. S. Florida. Dr. Orion O. Feaster, St. Petersburg, was installed as president. The next annual session will be held at St. Petersburg.

### ILLINOIS

**Outbreak of Dysentery.**—The state health department announces that an outbreak of dysentery at Ohio, involving 150 persons, was attributed to a contaminated public water supply. A clogged sewer main caused sewage from the town to back up through an outlet drain into the partly emptied water reservoir. This contaminated water was then pumped into the public supply system.

**Personal.**—Roger Adams, Ph.D., professor of organic chemistry and head of the department, University of Illinois, Urbana, was presented with the Willard Gibbs medal at a banquet, May 22, given by the Chicago section of the American Chemical Society. Dr. Samuel P. Colehour has resigned as city health officer of Mount Carroll, and Dr. Lawrence Isenhardt has been named to succeed him. Dr. Walter S. Swan, Harrisburg, was elected to honorary membership in the Saline County Medical Society at a celebration, April 15, in honor of his eighty-second birthday. Dr. Frederick W. Risser, Strasburg, was given a reception by the local chamber of commerce, April 27, in recognition of his completion of fifty years in the practice of medicine.

### Chicago

**Society News.**—Dr. Clara Jacobson addressed the Chicago Council of Medical Women, June 5, on "Sedimentation Tests in Health and Disease." At a meeting of the Chicago Club for the Study of Arthritis, June 3, Drs. Eugene F. Traut and Emil G. Vrtiak presented a "Statistical Study of Allergy in Arthritis," and Edwin P. Jordan, "Pathology of Rheumatoid Arthritis."

**The Capps Prize.**—The Institute of Medicine of Chicago announces that the time limit for submission of manuscripts for the Joseph A. Capps Prize is December 31. The \$500 prize will be awarded for meritorious investigation in medicine or in the specialties of medicine; the investigation may be also in the fundamental sciences, provided the work has a definite bearing on some medical problem. Competition is open to graduates of Chicago medical schools who have received the degree of doctor of medicine during the year 1934 or thereafter. Manuscripts should be submitted to the secretary of the Institute of Medicine of Chicago, 122 South Michigan Avenue.

### INDIANA

**Society News.**—At a meeting of the Fountain-Warren Counties Medical Society in Perrysville, May 7, Dr. Wendell D. Little, Indianapolis, discussed "Gallstones and Infection of the Biliary Tract."—Dr. Edward C. Holmblad, Chicago, addressed the Muncie Academy of Medicine in Muncie, May 5, on traumatic surgery.—The Knox County medical and dental societies were addressed in Vincennes, May 5, by Dr. John W. Graves and J. T. Gregory, D.D.S., and Gerald D. Timmons, D.D.S., all of Indianapolis, on "Role of the Teeth in Foci of Infection." Dr. Timmons and Dr. James F. Reilly, Vincennes, also discussed Indiana's program for maternal and child health under the Social Security Act.—Dr. William F. Hughes, Indianapolis, was elected president of the Indiana Academy of Ophthalmology and Otolaryngology in Martinsville, April 8, and Dr. Marlow W. Manion, Indianapolis, secretary. The academy changed its constitution so that all future meetings may be held in Indianapolis. Dr. Lee Wallace Dean, St. Louis, was guest speaker on allergic rhinitis.—Dr. Robert R. Dieterle, Ann Arbor, Mich., discussed "The Duty of the Practicing Physician Toward the Psychoneurotic Patient" at a meeting of the Northeastern Indiana Academy of Medicine in Garrett, April 23.

### IOWA

**Twin Lakes District Meeting.**—The fourteenth annual assembly of the Twin Lakes District Medical Society will be held at Burns' Alhambra Pavilion, Twin Lakes, Rockwell City, June 11, with Dr. Paul W. Van Metre, Rockwell City, presiding. Dr. Olin West, Secretary and General Manager, American Medical Association, Chicago, will speak. Diagnostic clinics in general medicine, eye diseases, general surgery, gynecology and pediatrics will be presented by the following guests: Drs. Robert W. Keeton, professor and head of the department of medicine, University of Illinois College of Medicine, Chicago; Cecil S. O'Brien, professor and head of the department of ophthalmology, State University of Iowa College of Medicine, Iowa City; Claud F. Dixon of the division in surgery, Mayo Foundation, Rochester, Minn.; Ralph A. Reis, associate in obstetrics and gynecology, Northwestern University Medical School, Chicago, and Willis Stanley Gibson, associate professor of pediatrics at Northwestern. The Twin Lakes District Medical Society is composed of the county medical societies of Calhoun, Carroll, Greene, Hamilton, Humboldt, Ida, Sac, Kossuth, Pocahontas, Webster and Wright, affiliated for graduate clinical instruction.

### KANSAS

**Personal.**—Dr. Robert J. Lanning, Junction City, has been appointed county physician and health officer of Geary County, succeeding the late Dr. William S. Yates.—Dr. Franklin E. Schenck, Burlingame, was guest of honor at a banquet, April 16, given by the newly created Osage County Medical Society; he has been practicing in Burlingame for forty years.—A catalogue of paintings presented to the people of Wichita by Dr. and Mrs. Herman de B. Seebold, New Orleans, has recently been issued. The gift was in memory of Mrs. Seebold's father, Mr. William Henry Kinney.

### LOUISIANA

**State Medical Election.**—Dr. Charles M. Horton, Franklin, was chosen president-elect of the Louisiana State Medical Society at its annual meeting in Lake Charles, April 29, and Dr. Hiram W. Kostmayer, New Orleans, was inducted into the presidency. Vice presidents are Drs. Roy Carl Young, Covington; Allen W. Martin, Bogalusa, and Lionel Bienvenu, Opelousas. Dr. Paul T. Talbot, New Orleans, was reelected secretary-treasurer for two years, and Monroe was chosen as the place for the 1937 meeting. The organization of the Louisiana Gynecological and Obstetrical Society took place during this meeting, April 28. Officers are Drs. Peter Graffagnino,

president; Edward L. King, vice president, and Walter E. Levy, secretary; all are of New Orleans. Mrs. George D. Feldner, New Orleans, was chosen president-elect of the woman's auxiliary to the state medical society at a session, April 29, and Mrs. James Byron Vaughan, Monroe, was installed as president.

### MASSACHUSETTS

**State Medical Meeting at Springfield.**—The one hundred and fifty-fifth anniversary meeting of the Massachusetts Medical Society will be held at the Hotel Kimball and Municipal Auditorium in Springfield, June 8-10. The speakers will include the following physicians:

Edward A. Schumann, Philadelphia, Antepartum Hemorrhage.  
Louis Schwartz, New York, Industrial Dermatoses.  
Mont R. Reid, Cincinnati, Problems of Wound Healing.  
Alice Hamilton, Boston, Some New and Unfamiliar Industrial Poisons.  
Arlie V. Bock, Boston, Use and Abuse of Transfusion in Medical Practice.  
Joseph H. Marks, Fall River, Roentgen-Ray Findings in Diaphragmatic Hernia.

A symposium on medical economics will be held Tuesday afternoon, the round table discussion to be opened by Dr. Charles E. Mongan, Somerville, president of the society. Dr. George Blumer, David P. Smith clinical professor of medicine, Yale University School of Medicine, New Haven, will deliver the Shattuck lecture Monday evening; his subject will be "Trichinosis, with Special Reference to Changed Conceptions of the Pathology and Their Bearing on the Symptomatology." Dr. Reginald Fitz, Boston, Wade professor of medicine, Boston University School of Medicine, will present the annual discourse Wednesday afternoon, entitled "From Cow-Path to State Road."

### MICHIGAN

**Personal.**—Dr. Hugh W. Williams, assistant superintendent of the Oakland County Tuberculosis Sanatorium, Pontiac, has been named medical superintendent of the Oakland County Infirmary.—Dr. Guy R. Post, White Cloud, director of the tricity health unit of Newaygo, Oceana and Lake counties, has been named to a similar position with a newly organized unit in Mecosta and Osceola counties, with headquarters in Big Rapids.—Dr. Frederick H. Cole, Detroit, has been appointed a member of the state board of registration in medicine, succeeding Dr. John E. Handy, Caro, resigned.—Dr. Nina C. Wilkerson has been appointed health officer of Sturgis, succeeding Dr. Charles G. Miller.—Dr. Neal J. McCann has been named health officer of Ishpeming, succeeding Dr. Joseph P. Bertucci.

**Society News.**—Dr. Eugene B. Potter, Ann Arbor, discussed "Some Phases of Plastic Surgery and Treatment of the Late Stage of Burns" before the Calhoun County Medical Society, May 5.—Dr. Morris Fishbein, Chicago, editor of THE JOURNAL, addressed the Detroit Teachers' Association in Detroit, May 25, on "Food, Fads and Follies." Previous to the lecture he was guest of honor at a banquet in the club-rooms of the Wayne County Medical Society.—At a meeting of the Kent County Medical Society, May 27, Dr. Robert L. Novy, Detroit, discussed endocarditis.—At the annual meeting of the Wayne County Medical Society, May 18, Dr. Raymond B. Allen, dean, Wayne University School of Medicine, Detroit, discussed "Trends in Medical Education." Dr. Frederick B. Burke was chosen president-elect of the society and Dr. Thomas R. K. Gruber, Eloise, was installed as president.—Dr. Harry L. Huber, Chicago, discussed "Present-Day Problems in Allergy" before the Kalamazoo Academy of Medicine, May 19.

### MISSISSIPPI

**State Medical Election.**—Dr. William L. Little, Wesson, was named president-elect of the Mississippi State Medical Association at its annual meeting in Greenville, May 5-7, and Dr. Harvey F. Garrison Sr., Jackson, was installed as president. Vice presidents are Drs. Angus L. Emerson, Hernando; Guy C. Jarratt, Vicksburg, and Charles C. Hightower, Hattiesburg. The next annual meeting will be held in Meridian, May 11-13, 1937.

### MISSOURI

**Personal.**—Dr. Theodore R. Meyer, Paw Paw, since July 1, 1934, health officer of Van Buren County, Mich., has been appointed to a similar position in St. Louis County.

**Society News.**—At a meeting of the St. Louis Medical Society, May 19, under the auspices of the St. Louis health division, speakers included Dr. George H. Mathae on "Treatment of Arthritis with Mecholyol Iontophoresis." Dr. Joseph Grindon Sr. discussed "Some Examples of Contact Dermatitis"

before the society, April 21, and Dr. Norman Tobias, "Summer Skin Diseases in the St. Louis Area." A symposium on the heart was presented by Drs. Drew W. Luten, Oswald P. J. Falk and Julius Jensen.

### NEBRASKA

**Hospital News.**—Bryan Memorial Hospital, Lincoln, held its annual clinic day April 6. Guests were Drs. Clifford G. Grulee, Chicago, who discussed breast feeding; William H. Olmsted, St. Louis, nephritis; Richard L. Sutton, Kansas City, Mo., dermatologic diseases; William C. Menninger, Topeka, Kan., problems of the general practitioner with regard to mental health of his patients, and Nathan A. Womack, St. Louis, the biliary tract.

**A Half Century of Service.**—Dr. Charles F. Kirkpatrick, Ashland, was guest of honor at a public reception sponsored by the Ashland chamber of commerce, April 8, celebrating his fiftieth anniversary of medical practice in the town. He received a traveling bag as a memento. Dr. Kirkpatrick is 78 years old.—Physicians of Dodge and Saunders counties gave a dinner in honor of Dr. Andrews E. Stuart, Cedar Bluffs, April 1, in Fremont, in celebration of his completion of fifty years of practice in one community. His colleagues gave him a watch as a token of esteem.

### NEW JERSEY

**Society News.**—Dr. Edward Rose, Philadelphia, addressed the Gloucester County Medical Society, April 16, in Woodbury; his subject was "Basal Metabolism and Its Relation to Disease."—At a meeting of the Mercer County Medical Society in Trenton, April 8, Dr. Bernard D. Judovich, Philadelphia, discussed "First Lumbar Neuralgia."—A symposium on the treatment of mental diseases was presented before the Morris County Medical Society in Greystone Park, April 16; speakers were Drs. Laurence M. Collins, Edward I. Kessler, Thomas G. Peacock and Malcolm C. Taylor.—The Bergen County Medical Society held its spring festival at Bergen Pines, the county tuberculosis hospital at Ridgewood, May 13. A program of outdoor sports preceded the scientific meeting, at which speakers included Drs. Oddino Bernardini and William J. Grosfeld of the sanatorium staff, who discussed results of treatment of pulmonary tuberculosis and thoracic surgery, respectively.

### NEW YORK

**Society News.**—The medical societies of Nassau and Westchester counties held their second annual joint dinner meeting and golf tournament, May 26, at the Westchester Country Club, Rye.—Dr. Marion B. Sulzberger, New York, addressed the St. Lawrence County Medical Society, May 21, on "Relationship of Dermatology to General Medicine."

**Scarlet Fever from Raw Milk.**—Seventy-two cases of scarlet fever with one death, which occurred in Wayne County between February 5 and March 3, have been traced to raw milk, *Health News* reported May 4. All cases but one occurred among patrons of a dairy that supplied two thirds of the village of Red Creek with raw milk. Hemolytic streptococci were found in throat cultures from three of the dairyman's children. One cow had a mastitis, and her milk contained hemolytic streptococci. Pasteurization of the milk supply was begun February 28.

### New York City

**Newspaper Bars Physicians and Dentists from Advertising.**—The New York *American* announces that "the advertising of doctors and dentists, as well as other questionable medical advertising," is henceforth barred from its columns. The publishers believe this action will "maintain and further strengthen the ethical standards of both the medical profession and the advertising business."

**Personal.**—Dr. Herbert S. Gasser, director of the Rockefeller Institute for Medical Research, New York, has been elected a corresponding member of the Sociedad Argentina de Biología de Buenos Aires.—Dr. Clarence O. Cheney, who was recently appointed medical director of Bloomingdale Hospital, White Plains, has been appointed professor of clinical psychiatry at Cornell University Medical College and consulting psychiatrist at New York Hospital. Bloomingdale Hospital is associated with Cornell. Dr. Cheney resigned as professor of psychiatry at Columbia University College of Physicians and Surgeons May 1.—Dr. McKen Cattell has been appointed associate professor of pharmacology in charge of the department at Cornell University Medical College.—Dr. Franz Boas, professor of anthropology, Columbia University, since 1899, has been made professor emeritus.

**Award to Dr. Van Slyke.**—The Charles Mickle Fellowship of the University of Toronto has been awarded to Donald D. Van Slyke, Ph.D., member of the Rockefeller Institute for Medical Research, in recognition of his methods of blood analysis, gasometric micro-analysis and his work on respiratory and renal reactions, diabetes and nephritis. This fellowship is the annual income from an endowment fund of \$25,000 and is awarded to the scientist who has, in the opinion of the council of the university, done most during the preceding ten years to advance sound knowledge of a practical kind in medical art or science. Dr. Van Slyke received his doctor's degree at the University of Michigan in 1907 and became a fellow in physiologic chemistry at the Rockefeller Institute the same year. He was made a member in 1921. He has been president of the Harvey Society and of the Society of Biological Chemists.

**Antinoise Ordinance Adopted.**—An ordinance prohibiting unnecessary and disturbing noises was adopted by the board of aldermen April 22. The new law prohibits sounding of horns or signal devices on vehicles not in motion and on vehicles in motion except as danger signals. Playing radios or other musical instruments loudly enough to disturb neighbors between 11 p. m. and 7 a. m. is specifically forbidden, as is the keeping of noisy animals and birds. Building or demolition of buildings may not be carried on at night in either business or residential areas except in emergencies, for which the commissioner of buildings must give special permission. Excessive noise on streets where there are hospitals, schools and courts is also banned. Other noises mentioned in the ordinance include the use of vehicles that are unnecessarily noisy because they need repair or are carelessly loaded; noisy unloading or loading of vehicles; blowing of stationary boiler steam whistles except as work or danger signals; operation of any engine without a muffler; bellowing of street hawkers; use of a drum, loud speaker or other noisy device to attract attention to theaters, stores or peddlers, and the use of loud speakers or amplifiers on moving vehicles except by permission of the police department. First offenders are subject to \$1 fine or one day in jail; second offenders to a \$2 fine or two days' imprisonment and so on, to a maximum of a \$10 fine or ten days in jail for five or more offenses. All offenses after the first are counted only if they occur within a year after the first, however.

### NORTH CAROLINA

**University News.**—Dr. Edward R. Baldwin, Saranac Lake, N. Y., addressed the faculty and students of Duke University School of Medicine, Durham, recently, on "The History of Tuberculosis Research in America."

**State Medical Election.**—Dr. Wingate M. Johnson, Winston-Salem, was chosen president-elect of the Medical Society of North Carolina at the annual meeting in Asheville, May 6. Drs. Charles A. Woodard, Wilson, and John F. Brownsberger, Asheville, were elected vice presidents and Dr. Louis B. McBrayer, Southern Pines, reelected secretary. The next meeting will be in Winston-Salem.

### OHIO

**Health Departments Merge.**—The Hocking and Vinton county health departments have merged, forming a new district health department under the supervision of Dr. Walter B. Lacock, health commissioner of Hocking County. This is the first two county setup in the state, it is reported, although cities and counties have been permitted to combine their health services in the past. Dr. Herbert D. Chamberlain, McArthur, who served as health officer of Vinton County, will retire from this post under terms of the merger.

**Personal.**—Dr. George P. Tyler, Ripley, celebrated the fiftieth anniversary of his graduation from the Medical College of Ohio, Cincinnati, March 10.—Dr. Dean H. Minnis, Warrensville, has been appointed superintendent at Pleasant View Sanatorium, Amherst, to succeed Dr. Aaron H. Smith, who recently resigned to return to private practice.—John Uri Lloyd, Cincinnati, one time president of the American Pharmaceutical Association, died in Los Angeles, April 9, aged 85.

**Flood Emergency Program.**—The state department of health reports that flood conditions in the eastern and southern parts of the state caused an emergency in health activities. Dr. Francis E. Mahla, Columbus, assistant director of health, with several members of the state department's staff, went to the flooded district to aid local health commissioners. About 15,000 persons were inoculated against typhoid; 1,251 wells and 689 cisterns were chlorinated; four springs were cleaned and chlorinated. At the time of the report there had been

no case of typhoid directly attributed to flooded wells. A small epidemic resulted from use of a well that was not in the flooded territory but was used because the flood had shut off the regular water supply.

## OREGON

**Committee to Study Treatment of the Insane.**—The state board of control has appointed a committee to study conditions for the treatment of the mentally afflicted, in order that a program of curative and preventive work may be outlined. Dr. Richard B. Dillehunt, dean, University of Oregon Medical School, Portland, is chairman of the committee. The program will be presented at the next session of the legislature.

**Drive Against Venereal Disease.**—A statewide campaign to control venereal disease in Oregon has been instituted under the direction of the state health officer, Dr. Frederick D. Stricker, according to *Northwest Medicine*. Physicians have been requested to cooperate. The law in Oregon requires the reporting of all venereal diseases to the state health department. In the present campaign, persons suspected of having venereal disease may be isolated at the discretion of the local health officer.

## PENNSYLVANIA

**State Radiologists' Meeting.**—The Pennsylvania Radiological Society was to hold its annual meeting in Williamsport, June 5-6. The following speakers, among others, were to appear on the program:

Dr. Gerald D. Bliss, Altoona, Irradiation Treatment of Acute Infections.

Dr. Edgar C. Baker, Youngstown, Ohio, Clinical Parathyroid Function.

Dr. William J. Corcoran, Scranton, Differential Diagnosis of Conditions About the Hip Joint.

Dr. Forrest L. Schumacher, Pittsburgh, Roentgen Study of the Mastoid.

Dr. Eugene P. Pendergrass, Philadelphia, Roentgen Diagnosis of Gall-bladder Disease.

Dr. Peter B. Mulligan, Ashland, Roentgen Study of Genito-Urinary Conditions.

**Society News.**—Dr. William James Gardner, Cleveland, addressed the New Kensington Academy of Medicine in New Kensington, April 20, on "Treatment of the Late Sequelae of Cerebral Trauma."—Dr. Harry A. Duncan, Philadelphia, addressed the Cambria County Medical Society, Johnstown, May 14, on "Office Gynecology."—Drs. Earl D. Osborne, Buffalo, and Henry W. F. Woltman, Rochester, Minn., addressed the Lycoming County Medical Society, Williamsport, May 8, on "Treatment of Syphilis" and "Neuritis" respectively. The guest speakers conducted clinics in the morning at Williamsport Hospital.—Drs. John H. Fager Jr. and Edgar S. Everhart addressed the Dauphin County Medical Society, Harrisburg, in April on "Diagnosis and Treatment of Prostatic Conditions" and "Fever Therapy in Syphilis and Gonorrhea" respectively.—Dr. Emil Novak, Baltimore, addressed the Fayette County Medical Society, Uniontown, May 15, on "Uses and Abuses of Gynecological Organotherapy."

## Philadelphia

**Society News.**—Speakers before the Philadelphia Academy of Surgery, May 4, were Drs. Edward J. Klopp and James M. Surver, on "Cancer of the Colon and Rectum," and Drs. John H. Gibbon Jr. and Edward D. Churchill, "Physiology of Massive Pulmonary Embolism."—Dr. Marshall N. Fulton, Boston, addressed the College of Physicians of Philadelphia, May 6, on "Use of Mercury as a Diuretic" and Drs. Charles C. Wolferth and Alexander Margolies, "Mechanism and Clinical Interpretation of Heart Sounds."—At a meeting of the Obstetrical Society of Philadelphia, May 7, speakers were Drs. Spencer Leon Israel, on "Ovarian Rupture Causing Intra-peritoneal Hemorrhage"; George M. Laws, "Spina Bifida Occulta, with Special Reference to Uterine Prolapse," and George A. Ulrich, "Use of Internal Podalic Version in Obstetrics."—Among speakers before the Philadelphia Roentgen Ray Society, May 7, were Drs. John T. Farrell Jr., on "Primary and Metastatic Pulmonary Malignancy"; Russel F. Miller, "A Roentgenologic Study of Sympathicoblastoma" and Bernard P. Widmann, "A Radiologic Conception of the Reticulo-Endothelial System."—Dr. Disraeli W. Kobak, Chicago, addressed the Philadelphia County Medical Society, May 27, on "Influence of Short Wave Radiation on Constituents of the Blood," and Drs. Eugene M. Landis and Lewis H. Hitzrot, on "Evaluation of Suction Pressure in Peripheral Vascular Disease."—Dr. Temple Fay discussed the mechanism of headache and Drs. Francis C. Grant and Robert A. Groff, tumors of the tuberculum sellae at the meeting of the Philadelphia Neurological Society, May 22.—At a meeting of the Metabolic Association of Philadelphia, May 22, Dr. Irvine H. Page,

New York, discussed arteriosclerosis and hypertension, and Dr. Virgil H. Moon, pathologic and general considerations of arteriosclerosis.

## SOUTH CAROLINA

**New Health Officers.**—Several new health officers for counties and districts have recently been appointed, according to newspaper reports. They include the following:

Dr. Gordon R. Westrope, Columbia, to Cherokee County.  
Dr. John Y. O'Daniel, Erwin, Tenn., to Marlboro County.  
Dr. George Fletcher Reeves, Goldsboro, N. C., to Colleton County.  
Dr. Edward P. White, Gaffney, to Richland County.  
Dr. William Burns Jones, Columbia, to Chester and Union counties.  
Dr. Thomas B. Phinizy, Augusta, Ga., to Bamberg, Allendale and Barnwell counties.

## TEXAS

**Personal.**—Dr. Bernhard E. Knolle, Industry, was recently the guest of honor at a barbecue at the Brenham Country Club celebrating his fiftieth anniversary in the practice of medicine. Dr. Knolle's sons, Drs. Waldo A. and Roger E. Knolle, were hosts and Dr. Richard E. Nicholson was toastmaster.—Dr. Edythe P. Hershey, director of health in the Dallas public schools, has been appointed director of the child health and maternity divisions of the state health department, it is reported.—Dr. Robert J. Jaehne, Austin, was recently named health officer of Travis County, it is reported.—Dr. Charles S. Carter, Bells, has been appointed to the board of medical examiners to succeed the late Dr. Marquis E. Daniel, Honey Grove.

## UTAH

**Society News.**—The Salt Lake County Medical Society has recently created a speakers' bureau to supply authoritative speakers in response to requests from lay groups and to give radio talks when the opportunity may arise. Dr. Edward S. Pomeroy is chairman of the bureau.—Drs. Leland R. Cowan and Ozra J. LaBarge, Salt Lake City, addressed the Central Utah Medical Society at Mount Pleasant, April 1.—Dr. Lewis Weston Oaks, Provo, addressed the Utah County Medical Society in April on allergy.—The council of the Utah State Medical Association visited the Cache Valley Medical Society, recently. Dr. William R. Tyndale, Salt Lake City, president of the state association, made an address on amebiasis; Dr. Louis E. Viko, Salt Lake City, president-elect, spoke on medical economics, and others discussed organization problems.

## VIRGINIA

**Pediatric Society Meeting.**—The annual clinic of the Virginia Pediatric Society was held at the Medical College of Virginia, Richmond, May 29. The program included a symposium on disorders of the respiratory tract, a clinical-pathologic discussion of pediatric cases and an address by Dr. Albert Compton Broders, Richmond, on "Malignancy in Children."

**New Health Officers.**—Dr. Mack I. Shanholtz, Beckley, W. Va., has been appointed director of the health district comprising Bristol and Washington counties, with headquarters at Bristol. Dr. Charles L. Savage, Charlottesville, has been appointed director of the Buchanan-Russell-Tazewell Health District, with headquarters at Richlands. Dr. John B. H. Bonner, Beaumont, was appointed director of the Sussex County Health District in April, with headquarters at Stony Creek.

## GENERAL

**Conference on Teaching of Psychiatry.**—The fourth conference on psychiatric education called by the division of psychiatric education of the National Committee for Mental Hygiene was held at Phipps Clinic, Baltimore, under the chairmanship of Dr. Adolf Meyer, director of the clinic, April 8-10. Thirty-eight medical schools were represented by 110 teachers of psychiatry. Discussions centered around types of teaching organization, especially the content of undergraduate courses; opportunities for teaching in state hospitals, consultation work, outpatient work, child guidance and social service and other fields.

**Dr. Wheeler Awarded Dana Medal.**—Dr. John M. Wheeler, professor of ophthalmology, Columbia University College of Physicians and Surgeons and director of the Institute of Ophthalmology at the Columbia-Presbyterian Medical Center, New York, was presented with the Leslie Dana gold medal for "outstanding achievements in the prevention of blindness and the conservation of vision" at a dinner in his honor in St. Louis, May 9. Dr. Wheeler was selected for the award by the National Society for the Prevention of Blindness in cooperation with the St. Louis Society for the Blind, which offers the prize

annually. Dr. Wheeler graduated from the University of Vermont School of Medicine in 1905. He has held his positions with Columbia and Presbyterian since 1928 and in 1934 was president of the American Academy of Ophthalmology and Oto-Laryngology.

**Association for Study of Goiter.**—The annual meeting of the American Association for the Study of Goiter will be held at the Drake Hotel, Chicago, June 8-10. Speakers will include the following physicians:

James B. Collip, Montreal, Canada.  
Jacob Lerman and William T. Salter, Boston, Role of Natural and Artificial Thyroid Proteins.  
John de J. Pemberton, Rochester, Hyperthyroid Reactions.  
Frederick A. Collier and Walter G. Maddock, Ann Arbor, Mich., Liver Function in Relation to Hyperthyroidism.  
James H. Hutton, Chicago, Response of Exophthalmic Goiter or Graves' Disease to Irradiation of the Pituitary and Adrenals.  
Arthur E. Hertzler, Halstead, Kan., End Results of Total Ectomies in Interstitial Goiters, Cardiotoxic States and Spontaneous Myxedema.

Tuesday morning clinics will be held at Augustana, Cook County and Presbyterian hospitals. The annual dinner will be addressed by Dr. Julius R. Yung, Terre Haute, Ind., president of the association, and Gordon Jennings Laing, LL.D., dean of the division of humanities, University of Chicago.

**Medical Bills in Congress.**—*Changes in Status:* H. R. 12374 has been reported to the House, proposing to authorize the President to provide employment for unemployed citizens of the United States to discover and develop the mineral resources, and to provide medical care and hospitalization for such persons. H. R. 12793 has been reported to the House, proposing, among other things, to amend the Harrison Narcotic Act so as to provide for the registration of persons using narcotics in a laboratory for the purposes of research, instruction or analysis and to impose a special tax on such registrants of \$1 per annum. *Bills Introduced:* H. R. 12839, introduced (by request) by Representative Bacon, New York, proposes to extend the status of veterans of the World War to persons enlisted and serving in war zones on United States Shipping Board vessels during the World War. H. R. 12890, introduced by Representative Colmer, Mississippi, proposes to extend the benefits for veterans of the Spanish-American War, including the Philippine Insurrection and the China Relief Expedition, to contract veterinarians.

**Meeting of Association for Advancement of Science.**—The section on medical sciences (N) of the American Association for the Advancement of Science will meet during the annual session of the parent organization, June 16-18, in Rochester, N. Y. The remainder of the meeting of the national society will be held in Ithaca. The main feature of the program of the section will be a memorial session in honor of Dr. Theobald Smith. This session, a joint one with the Central New York Branch of the Society of American Bacteriologists, will be opened with an address by Simon Henry Gage of Cornell University, entitled "Theobald Smith: Investigator and Man." A joint meeting will also be held with the Western New York Branch of the Society of Experimental Biology and Medicine. Speakers to appear on the two day program of the section will include:

Rudolph J. Anderson, Ph.D., New Haven, Chemical Studies on Wax Fractions of the Tubercle Bacillus.  
Dr. Augustus B. Wadsworth, Albany, Practical Problems in the Serum Test of Bacterial Infections.  
Dr. George P. Berry and Helen M. Dedrick, A.B., Rochester, Transformation of the Virus of Rabbit Fibroma (Shope) into That of Infectious Myxomatosis (Sanarelli).  
Dr. I. Newton Kugelmass, New York, Modifying Milk for Infants' Digestion.

**Society News.**—Dr. Mabel M. Akin, Portland, Ore., was chosen president-elect of the Medical Women's National Association at the annual meeting in Kansas City, May 11, and Dr. Catharine Macfarlane, Philadelphia, was installed as president. Other officers elected were Drs. Olga F. Stastny, Omaha, Marie E. Esmond, Kansas City, and Lillian C. Irwin, Seattle, vice presidents, and Dr. Julia Faith Skinner Fetterman, Philadelphia, secretary. At the fifth annual meeting of the Harvey Cushing Society in Rochester, Minn., May 15-16, Dr. Kenneth G. McKenzie, Toronto, was chosen president; Dr. Richard Meagher, New York, vice president, and Dr. Louise C. Eisenhardt, New Haven, secretary. Dr. Ernest Sachs, St. Louis, was chosen an honorary member. The next annual meeting will be held in Philadelphia. Dr. Thomas R. Boggs, Baltimore, was elected president of the Association of American Physicians at its annual meeting in Atlantic City, May 6; Dr. George R. Minot, Boston, was made vice president and Dr. Hugh J. Morgan, Nashville, Tenn., secretary.

**Fraudulent Instrument Repair Man.**—Numerous complaints have been received from physicians in North Carolina, Virginia and Tennessee describing an impostor who has been

soliciting work in repairing and replating surgical instruments. In North Carolina the name of the man was reported to be Postly, representing "Postly and Company," supposedly of Knoxville, Tenn. From a number of physicians he obtained instruments to be repaired, saying that his firm had a branch in Atlanta managed by his brother. The victims paid him in advance 25 cents per instrument. When the instruments were not returned within a reasonable length of time, they wrote to Atlanta and to Knoxville. Letters to Atlanta were returned, but those sent to Knoxville did not come back to the writers. Inquiries of the Knoxville postoffice revealed that Postly had mail addressed to 118 Market Street, a nonexistent street number, but received it through general delivery. The North Carolina physicians described the man as about 50 years old, of slight build and average height, not well dressed. Letters from Virginia and Tennessee tell a similar story except that the name used was Hinton and the firm "Hinton and Company," alleged to be in Louisville, Ky. They describe the man as about 50 years old, weighing about 150 pounds, 5 feet 10 inches tall, wearing glasses. One report said that his lenses are both minus 4, rimless, octagonal; that he has gray eyes and sandy hair, thin on top, and that he talks well and is interested in Egyptology. The chief of police in Louisville advised that there is no Hinton and Company at 518 South Fourth Street and no such name in the city directory.

## CANADA

**Public Health Organizations Hold Joint Meeting.**—The State and Provincial Health Authorities of North America, the Canadian Public Health Association, the Western Branch of the American Public Health Association, the Canadian Tuberculosis Association and the British Columbia Public Health Association will meet in Vancouver, B. C., June 22-27. The various groups will hold separate meetings for the most part, but there will be a general session Wednesday morning, June 24, at which the presidents of the various organizations will give their official addresses. This session will be followed by a luncheon at which speakers will be Drs. Thomas Parran, surgeon general of the U. S. Public Health Service, Washington, D. C., and John J. Heagerty, chief executive assistant, department of pensions and national health, Ottawa. The same evening there will be a public meeting, at which speakers will be the Hon. D. Pattullo, premier of British Columbia; George M. Weir, provincial secretary and minister of health of British Columbia, and Dr. Hugh A. Farris, St. John, N. B. Drs. Stanley H. Osborn, Hartford, Conn., and John G. Fitzgerald, Toronto, will speak at a joint luncheon Thursday, June 25.

## FOREIGN

**Summer School in Psychology.**—The fifth annual summer school in psychology at the University of Vienna Psychological Institute for English-speaking students will be conducted July 13-August 8. Information may be obtained from Henry Beaumont, Ph.D., department of psychology, University of Kentucky, Lexington, or directly from Egon Brunswik, at the psychologic institute, Liebiggasse 5, Vienna 1, Austria.

**New Medical Institute in Australia.**—The Australian government and the University of Adelaide are collaborating in the establishment of an Institute of Medical Science, it is reported. The government is contributing £15,000 to match a similar amount privately subscribed. Dr. Edward Weston Hurst, who is a member of the Lister Institute and reader in pathology at the University of London, has been appointed by the Australian government as director of the institute.

**Personal.**—Prof. Herbert H. Woollard, since 1929 professor of anatomy at St. Bartholomew's Hospital Medical College, has been appointed to the university chair of anatomy tenable at University College. Sir Patrick Laidlaw has been appointed by the British Medical Research Council to be deputy director of the National Institute for Medical Research and head of the department of pathology and bacteriology. The Cross of Officer of the Legion of Honor has been conferred on Sir Henry Wellcome, London, by the president of the French Republic.

## CORRECTION

**Outbreak of Epidemic Jaundice.**—The article by Willett, Sigoloff and Pfau entitled "An Institutional Outbreak of Epidemic Jaundice," in THE JOURNAL, May 9, was indexed on the inside cover page of that issue as "jaundice, epidemic, traced to holy water fonts." The index reference is misleading in that the relationship of the Leptospira found in the water to the dissemination of the outbreak could not be ascertained.

#### Some Schools Closed for Want of Children

The continual fall in the English birth rate has become a commonplace, but it is realized only by statisticians that it has for some time been below the level necessary for the reproduction of the present population, so that a decline, slow at first but more rapid after twenty years, is a necessary result of the present birth rate. A profound change has already taken place in the age constitution of the English population. While the birth rate has been falling, improved sanitation has prolonged life, with the result that the proportion of old persons in the population has increased and the proportion of children diminished. In 1901, 11.4 per cent of the population of England and Wales were children under 5 years of age and 10.6 per cent were persons over 55. By 1911 the percentage of children had fallen to 10.7 and of those over 55 years of age had increased to 11.6. The estimate for 1928 was 8 per cent of children under 5 years and 15.8 per cent of persons over 55 years. It is estimated that, by 1941, 7.5 per cent of the population will be children and more than 19 per cent persons over 55. The fall in the number of children is revealed by startling figures just published by the London County Council, which has had to close some of its schools. In the year 1914-1915 there were 727,052 children in these schools. In the present year there are only 510,000 and it is estimated that in 1936-1937 the number will fall to 475,000, a reduction of nearly 30 per cent in twenty-two years.

The fall in the birth rate began about sixty years ago and has since steadily progressed. In the decade 1871-1880 the average annual rate was 35.4 per thousand of population, and in the successive decades 32.4, 29.9, 27.2 and 21.8. After that the rates for individual years are available. Omitting the years in which considerable disturbance was produced by the war, from 1922 to 1927 the rates were 20.4, 19.7, 18.8, 18.3, 17.8 and 16.6. Thus in 1926 the rate was 17.8, almost exactly half what it was fifty years ago. In 1933 the birth rate reached its lowest point, 14.4, and was so near the death rate that the net increase of population was only 2.1 per thousand. From the beginning of the nineteenth century until the great war the population of England increased by 12.5 per thousand annually, a rate greater than that of any other country in Europe. From 1914 to 1924 the annual increase was only 4.7 and from 1924 to 1934 it was 4.4. The fall in the first period was due to high war mortality and decrease of fertility; in the second period, to further decrease of fertility.

But all these figures do not reveal the seriousness of the position. A slight increase of population still exists. What few people realize is that, while a population may increase for some time, its fertility may already be reduced to a level which means, if unchanged, ultimate extinction. This has occurred in England. To understand the position, recourse must be had to a new index of population growth, introduced by Kuczynski and termed "the net reproduction rate." This is defined as the average number of females that will be born to every new-born girl. It can easily be calculated on the assumption that the fertility and death rates of a particular year continue and so continue to be applicable to the life of the girls born in that year. If the average number of girls born to every new-born girl is one, each will be replaced by another in the next generation, and the population will remain stationary. If the average number is less than one, the population will decrease. Now the net reproduction rate of England and Wales for 1933 is

0.734. If the present rates are maintained, there will be in the next generation only about three fourths of the present number of new-born girls, and this reduction will be repeated in the succeeding generations.

An exhaustive study of the effect of the present trends in fertility and mortality on the future population of England and Wales, by Dr. Enid Charles, has been published by the London and Cambridge Economic Service. She points out that, if the present rates continue, the extinction of the population is only a matter of time. To forecast what will actually occur, she considers three hypotheses: (1) that the fertility and mortality rates continue as in 1933; (2) that the recent fall in these rates will continue; (3) that mortality continues to fall and that fertility remains constant at the 1931 level. According to the first hypothesis a decline in population will begin in 1943; according to the second, in 1939; according to the third, between 1960 and 1965. But there will be no spectacular change before twenty years has elapsed. Thereafter the fall will be rapid on any assumption that seems plausible in the light of experience. According to the first hypothesis the population will be halved a century hence; according to the second, it will be reduced to one tenth; according to the third, to about four fifths.

#### The Campaign Against Noise

The campaign against noise goes on. The claim is now made that London possesses the only hotel in Europe which is noise proof and air conditioned. Double windows, set in continuous heavy steel frames, exclude all noise. By a ventilating system fresh air, cleaned and maintained at an equable temperature, enters and is withdrawn through vents at floor level. In regard to these improvements Lord Horder, chairman of the Anti-Noise League, said that noise is going "to do us in" unless we do something about it. Modern life was full of stresses and strains, and it was essential to do everything possible to absorb unnecessary and provocative noise. The modern machine that we had devised would overcome us unless we controlled it.

The noise of aircraft is also receiving attention. The Anti-Noise League has been in communication with the Air Ministry and the Aeronautical Research Committee with regard to complaints received by it, mostly in connection with civil flying and particularly training and taxi aircraft. In a letter to the Secretary of State for Air, the league stated that widespread suffering was caused by low flying. The work in hospitals has been interfered with and annoyance has been caused during a funeral service. To the Aeronautical Research Committee it was suggested that airplanes on short flights should be required to have silencers affixed to their engines. The Air Ministry is taking cooperative action with the operating companies with view to reducing the evil.

#### New X-Ray Apparatus

A new x-ray apparatus which marks an important advance in technic has been installed at two London hospitals—St. George's and Brompton. By it roentgenograms of remarkably clear definition may be taken with an exposure of one-thirtieth second. Ordinary stationary apparatus requires exposures of at least one-tenth second and portable apparatus one of at least two seconds. The new instrument is portable. The inventor is Dr. A. Bouwers of Eindhoven, Holland. It has the advantage that it may be operated from the electric mains.

#### The Exploitation of the Deaf

The National Institute for the Deaf has issued a booklet on the exploitation of the deaf. The object is not to discourage the use of mechanical or electrical aids to hearing or to limit their sale by reputable firms but to draw attention to the extravagant and unjustifiable claims made for extensively advertised appliances. Inquirers in ever increasing numbers

report to the institute unscrupulous misrepresentation. The institute advises the deaf to consult an ear specialist, either privately or at a hospital, as to whether an aid is required. They are warned against advertisements which promise perfect hearing irrespective of the cause, degree of deafness or age of the sufferer. They are advised to sign no contract without having read it carefully and to avoid firms that do not allow for an adequate trial of any aid.

### Tubercle Bacilli in Gastric Contents in Children

At the January 24 meeting of the Société médicale des hôpitaux, Debré, Saenz, Broca and Costil emphasized that although it is not difficult to find tubercle bacilli in the stomach contents, the method is not so frequently employed as it deserves to be. The two methods recommended in the search for tubercle bacilli are the culture methods and animal inoculation. The sources of error are virtually negligible, as their experience has shown. In twenty-one cases of frank pulmonary lesions, as well as in tuberculous bronchopneumonia and miliary tuberculosis, the tubercle bacilli were found by culture or animal inoculation. In nontuberculous pulmonary lesions occurring in children, with positive skin reactions, the examination of the gastric contents for tubercle bacilli was negative in eleven cases. In ten cases of incipient pulmonary tuberculosis, there were six positive results. These six positive cases are of special interest because the physical examination was negative and in three of these six there was an absence of cough.

In twelve cases of erythema nodosum there were nine positive results; i. e., tubercle bacilli were found in the gastric contents. In seven of the nine positive cases the radiographic examination revealed an initial pulmonary focus. Debré, Saenz, Broca and Costil stated that the search for tubercle bacilli in the gastric contents is a method of diagnosis which deserves to be used in children as well as in adults who do not have any expectoration. The method is especially indicated in erythema nodosum, tuberculous meningitis, miliary tuberculosis and incipient tuberculosis. It is useful in cases in which the exposure to a tuberculous infection dates back only three or four months; i. e. before a tuberculin reaction can be expected to be positive.

A second paper by Lesné, Saenz, Dreyfus-Sée, Launay and Salambiez gave the results of the search by culture or animal inoculation for tubercle bacilli in the gastric contents in thirty-five children. In two thirds of the cases the tubercle bacilli were found in the gastric contents. Children below the age of 3 years seldom cough or expectorate; hence finding the bacilli by culture or inoculation in the gastric contents is of great diagnostic importance. All children below the age of 3 who show positive skin reactions should be isolated, because frequently toys or spoons become contaminated by tubercle bacilli in the saliva or nasopharyngeal secretions, as has been shown by Lesné and Langle in 70 per cent of tuberculous infants. Every institution that cares for children ought to separate those less than 3 years of age having positive from those having negative skin reactions.

A single examination of the gastric contents, either by culture or by animal inoculation, has sufficed to yield a positive result in every case of primary infection. Stained specimens of the gastric contents have been negative, although such children will occasionally show a few bacilli on staining of the sputum.

The recent advances in the clinical and radiologic diagnosis of such cases of primary infection in children makes it obligatory to separate these children in families, schools and sanatoriums from those who are in a receptive condition. Children

with primary infection should not be exposed to the dangers of superinfection which a stay in a sanatorium, where there are patients with cavities and whose expectoration contains many bacilli, would involve. Hence these children with primary infection constitute a special group who on the one hand must be prevented from infecting healthy children and, on the other, protected against additional infection by the more severely affected. These primary cases should be excluded from institutions receiving children with negative skin reaction, who are particularly susceptible to infection. Children with a positive reaction who do present either radiologic or clinical evidence and whose gastric secretions do not reveal the presence of bacilli can as in the past be considered noncontagious. They cannot be excluded from institutions receiving children with negative skin reactions.

In the discussion, Armand-Delille stated that his observations confirmed those cited by the authors of both papers.

Rist emphasized the value of examination of the gastric contents, in adults, for tubercle bacilli. One can readily follow the course of a case of pulmonary tuberculosis and thus determine its cure, by repeated examination of the gastric contents.

At the January 31 meeting, Armand-Delille read a paper on the same subject. His results were as follows: In fifty-two cases of the ulcerative type of pulmonary tuberculosis, fifty-two (100 per cent) positive results. In fifty cases of the infiltrating type of pulmonary tuberculosis, fifty-eight, or 76 per cent, positive results. In seventeen cases of miliary pulmonary tuberculosis, nine, or 53 per cent, positive results. In primary infection of infants, twenty-two, or 52 per cent, positive results. On the other hand, of 185 children sent for diagnosis who gave normal radiographic results and of whom 150 had positive skin reactions, the gastric contents were positive in only one. Armand-Delille praised the work of Saenz and Costil of the Pasteur Institute in developing the technic of the culture method for finding tubercle bacilli.

The search for tubercle bacilli in the gastric contents of children has been the subject of papers read in recent months before various societies in Paris. The latest of these was by Armand-Delille and Kerambrum at the March 10 meeting of the Académie de médecine. They have employed the Meunier method since 1927, in conjunction with homogenization as suggested by Bezançon and Philibert as a diagnostic resource in children and in certain adults, especially in young women when there is little expectoration. In 1,300 children there were 96.4 per cent positive results in pulmonary tuberculosis with cavity formation and 13.5 per cent positive results in serofibrinous pleurisy without demonstrable involvement of the lung itself. In cases suggestive of pulmonary tuberculosis but in which the stained sputum specimens were negative, there were seventeen positive and fourteen negative results on inoculating guinea-pigs with the gastric contents. Cultures on the Petroff medium have not given satisfactory results. With the Loewenstein or Petragani mediums in eleven cases, the guinea-pig and culture were both positive in two of these eleven cases, whereas in four of the eleven the culture was positive but the guinea-pig inoculation was negative. In five of the eleven, the guinea-pig test was positive and the culture negative. In 586 cases in which expectoration and physical signs were positive but roentgen examination was negative, the examination of the gastric contents was positive in only three.

### Bone Graft to Increase Diameter of Contracted Pelvis

A report of eight cases in which a contracted pelvis was enlarged by bone grafts following symphysiotomy, with one normal delivery already recorded, was made at the March 17 meeting of the Académie de médecine by Yves Delagénière of Mans. In October 1933 six cases were reported at the French Surgical Congress, in which a definite enlargement of

the pelvis followed the insertion of osteoperiosteal grafts placed in the interspace between the pubic rami, a few weeks after symphysiotomy had been performed. Since this first communication, two additional operations have been performed. In his present paper he reports one of the more recent successful cases. A primipara, aged 19 years, was admitted to the maternity, Oct. 19, 1934. The bag of waters had ruptured and labor had begun four days previously. Delivery with the aid of forceps had been attempted but the head was arrested above the pelvic inlet. As the anteroposterior diameter was only 8.5 cm., Delagénière decided to perform a symphysiotomy. A separation of about 3.5 cm. having been attained, forceps were applied and a living child weighing 2,500 Gm. (about 5 pounds) was delivered. A phlebitis as a puerperal complication necessitated sending the patient home for two months before attempting the insertion of osteoperiosteal grafts in the space between the two pubic bones. Two grafts each 7 cm. in length and 1.5 cm. in width were taken from the right tibia and inserted transversely in a 4 cm. wide interval corresponding to the former pubic symphysis. The patient returned home and the plaster cast was removed six weeks after the operation. She returned in December 1935 stating that she was eight months pregnant. The anteroposterior diameter measured 10.5 cm. Early in February 1936 a normal delivery lasting only three hours occurred. The child weighed  $6\frac{1}{2}$  pounds (about 3 Kg.). Examination of the eight patients operated by Delagénière revealed a separation of 3.5 cm. at the pubic symphysis without any complaints on walking or standing. As to the time at which the bone grafting should be performed, this can be done from ten to fifteen days after the symphysiotomy provided the temperature during the puerperium has not risen above 38 C. (100 F.); otherwise it is advisable to wait for two months. Following the bone grafting to enlarge the interpubic space, the patient should be kept in bed for six or eight weeks without any cast unless the interspace is more than 3.5 cm., when a light plaster girdle is advisable.

#### The Health of Applicants for Marriage Loans

The new policy of marriage loans has given rise to many medical questions, which have now in part been answered. The first comprehensive statistical report on the health of applicants for marriage aid has recently been published by the hereditary and racial hygiene section of the national bureau of health. This survey covers the year from July 1, 1934, to June 30, 1935. During this period there were received at the national bureau of health, where all such material is centralized, a total of 333,776 applications. Of this number, 97.28 per cent were considered acceptable; 2.72 per cent of the applications, however, were rejected on medical grounds. Noteworthy is the classification of the grounds for rejection under three main heads. The figures are as follows: Of the 27.2 per thousand rejected, 18.3, that is, two thirds of the total number, were rejected as afflicted with hereditary or acquired disease; a further 5.9, that is, about two ninths of the total number of rejections, were based on hereditary taint although the rejected were healthy phenotypes, and a final 2.9, forming one ninth of the total, were rejected because of the unfitness of the prospective marriage partner. Rejected applicants in the last named group receive a certification of fitness when and if they select another and healthier marriage partner. These figures are generally constant for the various political divisions of Germany as well as for the seasons of the year. There were in all 4,255 male and 4,810 female applicants rejected during the period covered by the report, a ratio of 100 males to each 113 females.

More than half (51.38 per cent) of all the rejections were based on congenital feeble-mindedness. Other hereditary diseases coming within the scope of the legislation, with their percental proportions to the total number of rejections, were schizophrenia 5.95 per cent, epilepsy 4.29, inherited bodily deformity 3.62, hereditary blindness and other visual disturbances 1.16, manic depressive insanity 1.06. Further may be mentioned alcoholism and other additions 1.39 per cent, psychopathic disorders 4.5, diabetes 1.11, diseases of the heart and blood vessels 2.37, nervous disorders 1.54, tuberculosis 5.49, suggestive type tuberculosis 1.67, syphilis 5.33, gonorrhea 1.58, sterility or incapacity for bearing children 2.64 and, finally, other conditions endangering a fruitful marriage 1.25 per cent. All others listed under particular specified diseases amount to less than 1 per cent. Criminality, for example, accounts for 0.62 per cent.

In 81.9 per cent of cases involving feeble-mindedness the applicants presented the congenital defect, while in 18.1 per cent of the cases the applicants were healthy phenotypes with defective heredity. Likewise in cases involving hereditary bodily deformities and psychopathic states the first category, that of the diseased phenotypes, preponderates; among the cases involving deformity the ratio is 87.7 per cent diseased phenotypes: 12.3 per cent healthy phenotypes; among cases involving psychopathic states the corresponding ratio is 75.3 per cent: 24.7 per cent. On the other hand, certain hereditary disorders show a preponderance of healthy phenotypes among the rejected; thus, schizophrenia 93.8 per cent healthy phenotypes, hereditary epilepsy 84 per cent healthy phenotypes, alcoholism 76.4 per cent healthy phenotypes to 23.6 alcohol addicts.

There is still a final subheading called "Uncertain Disease Conditions and Other Grounds for Rejection." Of the 134 persons included in the group, 12.68 per cent presented "unfavorable coincidences of minor defects" and 44.78 per cent were rejected on nonmedical grounds (racial extraction and political untrustworthiness, for example).

Persons rejected because of the unsuitability of the prospective marriage partner are considered as a separate class. There were 1,025 such rejections, representing 11.3 per cent of the total number.

This survey is of unique interest as the first of its kind. Whether or not these figures will remain constant when compared with data for longer periods of time cannot be foretold.

The number of marriage loans granted from August 1933 to the end of 1935 was 523,000 according to the most recent calculations of the national bureau of statistics (*THE JOURNAL*, Dec. 14, 1935, p. 1999). The law stipulates that for each child born a reduction of the principal of the debt shall be made; such partial remission of the obligation was made in 298,631 cases during the same period. In the year 1935 alone 156,788 marriage loans were repaid, the number of discounts for living births amounting to 155,060.

#### Voluntary Castration

A decree has just been issued by the minister of the interior and the minister of justice which seeks to regulate the question of voluntary castration. It applies to men who are guilty of crimes and misdemeanors imputable to degenerate sexual impulses. Such cases might involve homosexuality, for example, as well as such offenses as sodomy, indecent liberties with children, rape and exhibitionism. Persons may be castrated on their own consent when judicial opinion and forensic medical opinion concur in the advisability of this measure. The purpose of castration is to free the offender from the degenerate sexual impulse which it is feared would otherwise lead to the perpetration of further acts of a similar nature. Whether in a given case the official medical examiner will discuss with

the accused the question of voluntary castration or whether such discussion takes place only if the accused himself has expressed a willingness to be castrated will be determined according to the merits of the individual case. Since the organism is seriously affected both physically and psychically by castration, a careful examination must precede any such intervention. A written declaration must be submitted by the person involved, which may subsequently be withdrawn by him at any time. It is explicitly pointed out that the voluntary nature of the request must not be impaired by any suggestion of compulsion either direct or indirect. It is further expressly forbidden that a suspension of sentence be made in any way contingent on the offender's willingness to undergo castration. On the other hand, there is nothing in the law to prevent the granting of a suspension of sentence in these cases if the court has reason to believe that the future law-abiding conduct of the offender is guaranteed.

## NETHERLANDS

(From Our Regular Correspondent)

April 24, 1936

### The Development of Mental Hygiene

A report by Dr. E. F. Meyers on "The Development of Mental Hygiene" has been submitted to the International Bureau of Public Hygiene. Mental hygiene should remain the province of the physician. This report contains some valuable data. Jan. 1, 1935, the total population of the Netherlands was around 8,392,000, among whom were 23,700 insane persons undergoing asylum treatment either wholly or partly at governmental expense. Expenditures for this purpose amount to some 18,000,000 florins per annum. The number of persons with mental disorders committed for treatment has shown a steady increase independent of the growth of the population as a whole. This is demonstrated by the following table from the official report of inspection:

Year	Population of the Netherlands	Population of Asylums and Psychiatric Institutes	Percentual Proportion per 10,000 Inhabitants
1919	6,831,231	15,894	23.3
1925	7,416,418	19,065	25.7
1930	7,920,388	22,178	28.0

There are now forty-three institutions for the insane within the kingdom, of which eighteen are under nonsectarian auspices while the remainder are largely reserved for Protestants or Roman Catholics. One establishment is operated exclusively for Jewish patients. The most important organization, especially with regard to the "after-care" of nervous mental patients, is the central society, which has twenty-two branch dispensaries distributed throughout the kingdom. At the head of each of these stations is a psychiatrist assisted by a nurse, who handles the social case work. With regard to feeble-minded children, it is admitted that 2 per cent of the kingdom's school children must be placed in institutions which are termed 'schools of special instruction'. There are thirty-eight such schools located in as many communes. Of this number twenty-seven are designated as nonsectarian, while eleven have sectarian affiliations. The population of these thirty-eight schools is at present 9,024. In addition there are thirteen boarding schools furnishing special instruction for feeble-minded children. Five of these schools are conducted by psychiatric institutes. There are two pedagogic institutes in the kingdom, one connected with the University of Amsterdam (Protestant) and the other with the University of Nimeguen (Roman Catholic).

Prophylactic measures against mental disorders may resolve themselves into such activities as the campaigns against alcoholism and syphilis, but most important of all are those systematic eugenic measures dictated by our knowledge of hereditary mental disease. Among all the patients treated, the

disorder could be traced to alcoholism in 13 per cent of the men and 3 per cent of the women, and to syphilis in 13 per cent of the men and 7 per cent of the women.

## Arsine Intoxication

Mr. Hult and Dr. A. Vos reported in the *Geneeskundig Tijdschrift der Rijksverzekeringbank* all the cases of arsine poisoning that have occurred in the zinc oxide factories of the Netherlands. They cite two groups of cases. In the first, six workmen were taken ill, one fatally, while on duty in a plant where zinc dust stored in special vats was converted into zinc sulfate. This process entailed the generation of hydrogen and of arsenic and the gases emanating from the vats, instead of being carried off by the wooden flues intended for that purpose, leaked out into the premises. In the second instance the workroom had been ordered kept open at all times but through the carelessness of one of the men a leakage took place which permitted the noxious gas to invade the premises. The hospital physician noted that the patients complained of itching on the hands and fingers. Diagnosis can be quickly established by the patients' reddish urine, which contains hemoglobin and methemoglobin. The arsine is transformed to colloidal arsenic by the oxidized hemoglobin. The liver produces a large quantity of obstructive bile, which gives rise to icterus. The cyanogen and jaundice impart a peculiar hue to the epidermis, so that the patient resembles an Indian. Physicians are compelled by law to report all cases of arsine poisoning to some competent authority.

## ITALY

(From Our Regular Correspondent)

April 7, 1936

### Reunion of Gastro-Enterologists

The first reunion of the Società italiana di gastro enterologia took place recently at the University of Rome, under the chairmanship of Prof. Cesare Frugoni of Rome. Professor Baglioni, director of the Scuola di Fisiologia of Rome, spoke on the metabolism of alcohol. Microdeterminations of alcoholemia have proved the presence of a small but determinable quantity of alcohol in the blood of sober persons during fasting (about 0.005 Gm. of alcohol per thousand cubic centimeters of blood). This fact indicates that alcohol is not a heterogeneous substance to the human body. The results of the studies of the curve of alcoholemia proved also that there is more alcohol in the blood following drinking on an empty stomach than following it together or after a meal. Seriani investigated the variations of alcoholemia in several experimental conditions. He found also that, when the functions of the liver are impaired, the curve of alcoholemia which follows drinking during or after a meal is not lower than that which follows drinking in the same person on an empty stomach. An analogous behavior is followed by the alcoholemic curve of patients suffering from diabetes mellitus. Insulin fails also to lower the alcoholemic curve in patients with diabetes although it retains the hypoglycemic action on the blood. Histamine, which produces a lowering of the alcoholemic curve when administered to normal persons, fails to change the curve of patients suffering from gastric achylia. The same is the case with the administration of sodium dehydrocholate (decholin), a stimulative substance for the functions of the liver, when given to patients suffering from grave liver diseases. The results of the studies carried on by Baglioni and his school are showing the possibility of applying this knowledge to the clinical and physiologic fields. A first and important application is that of the comparative study of the curve of alcoholemia during fasting and after a meal (Seriani-Lolli's test for functions of the liver), which has proved to be of value in the interpretation of certain hepatic syndromes.

Professor Alessandrini spoke on diabetic polyneuritis. After reviewing the relations between diabetes and the reserves of vitamins and also between insulin and vitamin B, the speaker discussed the possibility of the development of frustate forms of vitaminosis B in diabetes, as a result both of the limitations of food and of the pathologic conditions of the organs concerned with digestion in the diabetic. It results, from recent investigations of several authors, that the daily need of vitamin B is in direct relation to the individual alimentary habits and that persons who habitually take into their system a certain amount of the vitamin lose the faculty of forming it synthetically. The use of insulin causes an aggravation of beriberi because it leads to a consumption of the vitamins in reserve in the body.

Professor Egidi spoke on surgery in cancer of the rectum. The operation should begin by closing the routes through which metastasis might occur. The larger part of recurrences originate in the periproct connective tissues. Therefore the operation should be wide both vertically and transversally. Preservation of the anal portion is advisable whenever the distance of the tumor to the anal region permits preservation. Egidi prefers a technic by which removal of the tissues is performed from upper to lower segments of the rectum, because this technic gives the opportunity of cutting off the lymphatic routes of possible propagation of metastases at the beginning of the operation and also of ligating the superior hemorrhoidal artery above its anastomosis to the sigmoid artery. The speaker reported in 1928, before the Società di Chirurgia, twelve cases with a mortality of 50 per cent and also sixteen operations, performed from the lower to the upper segments of the rectum, with a mortality of 25 per cent. From that time on he performed the operation from the upper to the lower segments of the rectum in forty-one cases, with a mortality of 19 per cent.

#### Frequency of Tuberculous Meningitis

Dr. Giordano, in a lecture recently delivered to the Società Medica di Catania said that tuberculous meningitis developed in ninety-eight cases out of a group of 806 cases of tuberculosis seen by him during his practice. The infrequency of tuberculous meningitis in adults is rather relative: The disease develops in 7 per cent of the cases in patients above 30 years of age and in 16 per cent of the cases in patients below that age. The forms of tuberculosis which more frequently are complicated by meningitis are, besides miliary and acute pulmonary tuberculosis, pulmonary tuberculosis of the fibrous type and also tuberculosis of the lymph nodes, which may escape diagnosis during the clinical examination of the patient.

#### The Reticulo-Endothelial System

Dr. Santojanni, in a recent lecture before the Accademia delle Scienze Medico-Chirurgica of Naples, reported the results of experiments that were performed with the aim of investigating the behavior of the reticulo-endothelial system in rabbits with provoked hyperlipemia. The frequency of lipidosis in the clinical field and the importance of the problems involved in the genesis of the syndrome give importance also to the study of the behavior of the reticulo-endothelial system, a specific activity of which controls the metabolism of lipids. The experiments were performed in rabbits treated with lithium carmine and by the administration of daily intravenous injections of lecithin lutein. The worker found that the skin acts as a depot for accumulation of lipids when the equilibrium of the blood is disturbed because of the presence of lecithin and lutein in the blood. The functions of lipid accumulation and storage are performed by the cells of the keratopoietic tissues and also by those of the reticulo-endothelial system. The latter acts by a triple mechanism, by which the activity of its cells for seizing the lipids is stimulated, the morphologic character-

istics of its cells are modified and the cells themselves spread as in a net, in a wide surface appearing under the form of hyperplasia of all the connective cells of the skin. The specific and characteristic activities of the reticulo-endothelial system are more intense in the cutaneous areas that have been made hyperemic by repeated massage than in the areas of normal skin, while no modifications are provoked by the stimulation of the skin by weak doses of roentgen irradiations.

#### Plastic Induration of Penis

Dr. Celli recently reported three cases of sclerosis of the cavernous bodies in members of the same family. Plastic induration is characterized by the presence of fibrous and nodular infiltrates beneath the tunica albuginea in one or both cavernous bodies of the penis. As a rule the infiltrates appear separately in the cylindric, round or ovular forms. They are more perceptible during erection. The sexual functions may be either diminished or absent, because of mechanical causes. Two forms, the essential, or primary, and the secondary, can be differentiated. Primary sclerosis is the manifestation of an arthritic diathesis. It originates in local accumulation of salts, such as uric acid and sodium and calcium urates, which may result in the formation of calcified concretions and even in processes of partial ossification. Secondary sclerosis, on the other hand, follows previous processes of inflammation, infection and trauma. Prognosis and treatment depend on the form, either primary or secondary, of the condition. An antiuric-acidemic treatment is indicated in the primary form, in which, however, surgical intervention gives either uncertain or non-sufficient results.

#### Meeting of Dermatologic Society

The second reunion of the Sicilian Section of the Società Italiana di Dermatologia e sifilografia took place recently at the clinica dermosifilopatica of Palermo, under the chairmanship of Professor Tommasi. Dr. Flarer reported a case of atypical primary cutaneous lymphocytoma simulating a patch of psoriasis. The absence of the Auspitz sign, the presence of moderate infiltration and the fact that the cutaneous lesion was the only one which made its appearance failed to support a diagnosis of psoriasis. The examination of tissue removed for biopsy showed a thick infiltrate and foci of small lymphocytes. There was a lymphocytosis (66 per cent), discovered by examination of the blood.

Dr. Monacelli spoke on the diagnosis of cutaneous leishmaniasis. His method consists in producing an intradermal reaction following the administration of a specific vaccine. In many cases with atypical clinical symptoms in which several serologic methods in use had given uncertain results, the speaker's seroreaction gave positive results.

#### Deaths

Dr. Guglielmo Oliaro, the founder and editor of *Lotte Sanitarie*, of *Minerva Medica* and of other journals of specialties recently died in Turin.

## Marriages

ROBERT L. TOLLE, St. Louis, to Miss Mary Virginia Murphy of Mulberry, Fla., in Lakeland, Fla., recently.

ALFRED LESLIE DUNCOMBE to Miss Louise Howard Flagg, both of Brockton, Mass., May 15.

HERMAN G. EICHORN, Peoria, Ill., to Mrs. Mary McMeach Choate of Carthage, March 28.

JOHN A. VIETOR to Miss Ruth Withington, both of New York, March 14.

JOHN A. KNAUF, Chilton, Wis., to Miss Dorothy Dhein, recently.

## Deaths

**Herbert Lee Alkire**, Topeka, Kan.; Jefferson Medical College of Philadelphia, 1887; in 1908 a member of the House of Delegates of the American Medical Association; member of the Kansas Medical Society and the American Academy of Ophthalmology and Oto-Laryngology; formerly professor of anatomy and otology, Kansas Medical College, Medical Department of Washburn College, Topeka, and associate professor of otorhinolaryngology, University of Kansas School of Medicine, Kansas City; on the staff of St. Francis Hospital; aged 73; died, April 27, of arteriosclerosis.

**Arthur Robin Edwards** ♂ Boston; Chicago Medical College, 1891; professor of principles and practice of medicine and clinical medicine, 1897-1917, and later dean, Northwestern University Medical School; member of the Illinois State Medical Society and the Association of American Physicians; was attending physician to the Cook County, Mercy, Michael Reese, Wesley and St. Luke's hospitals, Chicago; author of a textbook, "Principles and Practice of Medicine"; aged 68; died, May 17.

**Jacob Warren Newman** ♂ New Orleans; Hessische Ludwig-Universität Medizinische Fakultät, Giessen, Hesse, Germany, 1898; Tulane University of Louisiana School of Medicine, New Orleans, 1902; professor of obstetrics, emeritus, Tulane University Graduate School of Medicine; fellow of the American College of Surgeons; for many years on the staff of the Touro Infirmary; aged 61; died, May 1.

**Louis Alfred Roller**, Grand Rapids, Mich.; Rush Medical College, Chicago, 1881; member of the Michigan State Medical Society and the American Academy of Ophthalmology and Oto-Laryngology; for many years a member and formerly president of the city board of health; honorary member of the staff of the Butterworth Hospital; aged 81; died, May 4.

**Michael Lawless Ryan**, Syracuse, N. Y.; Syracuse University College of Medicine, 1913; member of the Medical Society of the State of New York; instructor in clinical medicine at his alma mater; aged 44; vice president of the medical staff of St. Joseph Hospital, where he died, March 4, of carcinoma of the colon and liver.

**Nathan Starr** ♂ Charleston, Ill.; Hahnemann Medical College and Hospital, Chicago, 1889; past president of the Coles County Medical Society; for many years member and president of the board of education; on the staff of the M. A. Montgomery Memorial Sanatorium; aged 76; died, March 18, of bronchopneumonia.

**Charles Hodge Wallace Jr.** ♂ St. Joseph, Mo.; University of Pennsylvania School of Medicine, Philadelphia, 1924; fellow of the American College of Surgeons; member of the staffs of the Missouri Methodist and St. Joseph's hospitals; aged 36; died, April 26, in Rochester, Minn., of meningitis following a mastoid operation.

**Nichols Peterson**, Tifton, Ga.; Louisville (Ky.) Medical College, 1890; member of the Medical Association of Georgia; formerly member of the state board of medical examiners, state legislature and school board; aged 68; died, March 13, in the Coastal Plain Hospital, of pneumonia as the result of a fall.

**James Bernard Maguire**, Terre Haute, Ind.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1907; member of the Indiana State Medical Association; formerly deputy coroner; aged 53; died, March 2, in the Union Hospital, of cerebral hemorrhage.

**Clarence Eugene Kjos** ♂ Mount Vernon, Wash.; Rush Medical College, Chicago, 1924; past president of the Skagit County Medical Society; member of the Pacific Coast Oto-Ophthalmological Society; on the staff of the Mount Vernon General Hospital; aged 36; died, March 26, of influenza.

**George William Augustin**, Oneonta, N. Y.; New York Homeopathic Medical College and Hospital, 1899; served during the World War; city health officer; aged 59; on the staff of the Aurelia Osborn Fox Memorial Hospital, where he died, March 28, of cirrhosis of the liver and chronic nephritis.

**Richard F. Marrs**, Macomb, Ill.; Eclectic Medical Institute, Cincinnati, 1889; member of the Illinois State Medical Society; president of McDonough County Medical Society; member of the board of health; aged 74; on the staff of the Marietta Phelps Hospital, where he died, March 18, of heart disease.

**Joseph Bynum Stanley**, Jackson, La.; Memphis (Tenn.) Hospital Medical College, 1904; member of the Louisiana State Medical Society; member of the staff of the East Louisiana State Hospital; aged 54; died, February 23, in Memphis, of cerebral thrombosis and bronchopneumonia.

**Daniel Richard Cornelius**, Florence, Ala.; Atlanta (Ga.) School of Medicine, 1908; member of the Medical Association of the State of Alabama; served during the World War; aged 54; on the staff of the Coffee Memorial Hospital, where he died, March 13, of cerebral hemorrhage.

**John Leverett**, Yonkers, N. Y.; College of Physicians and Surgeons, Medical Department of Columbia College, New York, 1891; member of the Medical Society of the State of New York; aged 69; on the staff of St. John's Riverside Hospital, where he died, March 2, of pneumonia.

**Judson Coleman King**, Sona Bata, Belgian Congo, Africa; University of Michigan Homeopathic Medical School, Ann Arbor, 1913; an associate fellow of the American Medical Association; for many years a medical missionary; aged 56; died, March 27, of pernicious anemia.

**Henry C. Amos** ♂ Denton, Texas; Memphis (Tenn.) Hospital Medical College, 1911; past president of the Denton County Medical Society; formerly county health officer; at one time on the staff of the Denton Hospital and Clinic; aged 51; died, March 26, of lobar pneumonia.

**Gustavus Schlegel**, New York; College of Physicians and Surgeons, Medical Department of Columbia College, New York, 1883; member of the Medical Society of the State of New York; aged 77; died, March 5, in the Lenox Hill Hospital, of erysipelas and arteriosclerosis.

**John Mell Smith**, Starke, Fla.; University of Georgia Medical Department, Augusta, 1912; served during the World War; physician of the Civilians' Conservation Corps; aged 50; died, March 3, in the Veterans Administration Facility, Lake City, Fla., of abscess of the liver.

**Charles Richard Sista**, Trenton, N. J.; Medico-Chirurgical College of Philadelphia, 1915; member of the Medical Society of New Jersey; served during the World War; aged 45; on the staff of St. Francis Hospital, where he died, March 13, of Hodgkin's disease.

**Francis E. Brown** ♂ Catonsville, Md.; University of Maryland School of Medicine, Baltimore, 1893; affiliated with the United States Public Health Service during the World War; on the staff of the Spring Grove State Hospital; aged 69; died, March 9.

**Arthur Henry Perry**, Berea, Ohio; Cleveland Medical College, 1897; Cleveland College of Physicians and Surgeons, Medical Department, Ohio Wesleyan University, 1899; formerly health officer; aged 79; died, February 28, in the Community Hospital.

**Samuel J. Bradbury**, Lynbrook, N. Y.; Bellevue Hospital Medical College, New York, 1880; member of the Medical Society of the State of New York; bank president; formerly health officer of Lynbrook; aged 82; died, March 28, of arteriosclerosis.

**William Douglas Ward** ♂ Rochester, N. Y.; University of Pennsylvania Department of Medicine, Philadelphia, 1899; fellow of the American College of Surgeons; on the staffs of the Park Avenue and Monroe County hospitals; aged 61; died, May 14.

**David Benjamin Beach** ♂ Hamilton, Texas; Memphis (Tenn.) Hospital Medical College, 1907; secretary of the Hamilton County Medical Society; part owner of the Hamilton Sanitarium; aged 52; died, March 18, in a hospital at Waco.

**Henry A. Zimmerman**, Hollsopple, Pa.; Medical College of Ohio, Cincinnati, 1905; member of the Medical Society of the State of Pennsylvania; formerly bank president and county coroner; aged 53; died, March 16, of cerebral hemorrhage.

**Samuel Isaac Conduff**, Roanoke, Va.; Baltimore Medical College, 1898; member of the Medical Society of Virginia; aged 60; died, March 18, in the University of Virginia Hospital, University, of hypertensive arteriosclerotic heart disease.

**Geza Nemet** ♂ New York; Magyar Királyi Pázmány Petrus Tudományegyetem Orvosi Fakultása, Budapest, Hungary, 1919; on the staff of the Montefiore Hospital for Chronic Diseases; aged 40; died, March 1, of bronchopneumonia.

**Henry Lerner** ♂ Brooklyn; University and Bellevue Hospital Medical College, New York, 1910; president of the board of directors and chief of the medical staff of the Crown Heights Hospital; aged 50; died, March 6, of heart disease.

**Lorenzo Walter**, Spokane, Wash.; Northwestern University Medical School, Chicago, 1928; member of the Washington State Medical Association; aged 35; died, March 25, of complications resulting from an infection of the hand.

**David Donald**, Victoria, B. C.; L.R.C.P., Edinburgh, L.R.C.S., Edinburgh, L.F.P. & S., of Glasgow, Scotland, 1892; University of Durham College of Medicine, Newcastle-upon-Tyne, England, 1908; aged 70; died, February 2.

**Walter Edward King** ☉ Detroit; Detroit College of Medicine, 1914; member of the American Society of Clinical Pathologists; laboratory executive of Parke, Davis & Co.; aged 58; died, May 1, of coronary thrombosis.

**Robert Kabus Jr.**, New York; University and Bellevue Hospital Medical College, New York, 1905; member of the Medical Society of the State of New York; consultant to the Midtown Hospital; aged 57; died, March 2.

**Thomas Leland Baxter** ☉ Newark, Ohio; Rush Medical College, Chicago, 1902; past president of the Licking County Medical Society; on the staff of the Newark Hospital; aged 56; died, March 7, of pneumonia and meningitis.

**Francis Gilchrist Jones**, Atlanta, Ga.; Atlanta College of Physicians and Surgeons, 1910; member of the Medical Association of Georgia; aged 49; died, March 2, in a local hospital, of complications following an appendectomy.

**Robert D. Lange**, Cincinnati; Kungl. Universitetet i Uppsala Medicinska Fakulteten, Sweden, 1902; director of the roentgen ray department of the Longview Hospital; aged 54; was killed, February 21, when struck by an automobile.

**Oscar Silas Cox**, McArthur, Ohio; Starling Medical College, Columbus, 1892; member of the Ohio State Medical Association; president and formerly secretary of the Vinton County Medical Society; aged 70; died, March 19.

**Hugh Moran Anderson**, Sanatorium, Miss.; College of Physicians and Surgeons, Baltimore, 1907; veteran of the Spanish-American War; on the staff of the State Tuberculosis Sanatorium; aged 55; died, February 6.

**Charles B. Schoales**, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1886; member of the Medical Society of the State of Pennsylvania; aged 71; died, March 17, of chronic myocarditis.

**John T. Carter**, Triadelphia, W. Va.; Medical College of Ohio, Cincinnati, 1874; member of the West Virginia State Medical Association; aged 85; died in March, of empyema of the gallbladder and chronic nephritis.

**Marcus Earl Wilson** ☉ Phoenix, Ariz.; Medical College of Ohio, Cincinnati, 1907; member of the Associated Anesthetists of the United States and Canada; aged 53; died, March 29, of pulmonary tuberculosis.

**Philip Beekman** ☉ Natchez, Miss.; Bellevue Hospital Medical College, New York, 1888; formerly on the staff of the Natchez Charity Hospital; aged 71; died, February 14, of cerebral thrombosis and arteriosclerosis.

**James Daniel Blevins**, Beaumont, Texas; University of Texas School of Medicine, Galveston, 1915; served during the World War; aged 54; died, March 8, in the William Beaumont Hospital, El Paso, of pneumonia.

**Harry Reginald Williams**, Lincoln, Ill.; Loyola University School of Medicine, Chicago, 1931; member of the Illinois State Medical Society; on the staff of the Lincoln State School and Colony; aged 31; died, March 4.

**Henry Valentine McLaughlin**, Boston; L.R.C.S., Ireland, 1884, and L.R.C.P., Edinburgh, 1884; an Affiliate Fellow of the American Medical Association; aged 79; died, February 15, of coronary thrombosis.

**Emma Jane Davies Pronger**, Denver; University of Nebraska College of Medicine, Homeopathic Department, Lincoln, 1885; Hahnemann Medical College and Hospital, Chicago, 1886; aged 73; died, March 9.

**Robert Lewis Sample**, Summit, Ga.; Bellevue Hospital Medical College, New York, 1892; member of the Medical Association of Georgia; aged 68; died, March 12, of pneumonia following influenza.

**Bartolo Pedro Oliveros**, Charleston, S. C.; University of Maryland School of Medicine, Baltimore, 1883; formerly on the staff of the Savannah (Ga.) Hospital; aged 75; died, March 2, of cerebral hemorrhage.

**Florence Frances Rice**, Boston; Tufts College Medical School, Boston, 1903; member of the Massachusetts Medical Society; aged 80; died, February 4, in the Boston State Hospital, of arteriosclerosis.

**John Plumer Cole**, Wheeling, W. Va.; College of Physicians and Surgeons, Baltimore, 1903; member of the West Virginia State Medical Association; aged 63; died, March 24, of coronary occlusion.

**Willard Edwin Dinsmore**, Claremont, S. D.; Jefferson Medical College of Philadelphia, 1886; member of the South Dakota State Medical Association; aged 77; died, February 14, of arteriosclerosis.

**Albert Franklin Woodward**, Detroit; Trinity Medical College, Toronto, Ont., Canada, 1885; aged 79; died, February 19, in the Highland Park (Mich.) General Hospital, of endocarditis and arteriosclerosis.

**Palmer Augustus Potter**, Summit, N. J.; Columbia University College of Physicians and Surgeons, New York, 1899; served during the World War; aged 62; died, March 16, of coronary occlusion.

**James C. Osborne**, Acworth, Ga.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1897; member of the Medical Association of Georgia; aged 82; died, March 11, of bronchial asthma.

**Samuel Riddle Proudft**, Youngstown, Ohio; Ohio Medical University, Columbus, 1898; member of the Ohio State Medical Association; on the staff of St. Elizabeth's Hospital; aged 69; died, February 18.

**Walter White Burgess**, Roanoke, Va.; Johns Hopkins University School of Medicine, Baltimore, 1934; assistant resident physician at the Jefferson Hospital; aged 28; died, March 16, of pneumonia.

**Frank McMorro**, Syracuse, N. Y.; Bellevue Hospital Medical College, New York, 1893; member of the Medical Society of the State of New York; aged 65; was found dead, February 17.

**William H. Gelsthorpe**, Wellsburg, W. Va.; University of Wooster Medical Department, Cleveland, 1885; at one time mayor of Great Falls, Mont.; aged 78; died, February 7, of myocarditis.

**Herman Fred Koesterling**, Kansas City, Mo.; Kansas City Hahnemann Medical College, 1907; aged 72; died, February 22, in St. Joseph's Hospital, of pyloric obstruction and postoperative pneumonia.

**Joseph A. Cramp**, Philadelphia; Medico-Chirurgical College of Philadelphia, 1891; member of the Medical Society of the State of Pennsylvania; aged 70; died, March 29, of bronchopneumonia.

**Josiah S. Chastain**, Prescott, Ark.; University of Nashville (Tenn.) Medical Department, 1903; member of the Arkansas Medical Society; aged 66; died, March 12, of coronary occlusion.

**Duncan Allison**, Welland, Ont., Canada; University of Toronto Faculty of Medicine, 1908; served with the Canadian Army during the World War; county coroner; aged 58; died, March 15.

**Christian Edward Petersen**, Richmond Hill, N. Y.; Long Island College Hospital, Brooklyn, 1897; for ten years medical inspector for the state department of education; aged 60; died, March 5.

**David Harvey Nichol**, London, Ont., Canada; Queen's University Faculty of Medicine, Kingston, 1919; medical director of the Westminster Hospital; aged 39; died, February 2.

**Edward Michael Merrins**, Whittier, Calif.; University of the City of New York Medical Department, 1890; aged 74; died, February 17, of myocarditis and chronic rheumatoid arthritis.

**Arthur C. Norton**, Middletown Springs, Vt.; New York Homeopathic Medical College, 1882; member of the Vermont State Medical Society; aged 76; died suddenly, February 10.

**Latta Arthur Crandell**, Lewisport, Ky.; University of Louisville Medical Department, 1911; aged 46; died, March 28, in the Owensboro (Ky.) City Hospital, of lobar pneumonia.

**George Sidney Mothersill**, Ottawa, Ont., Canada; McGill University Faculty of Medicine, Montreal, Que., Canada, 1902; aged 56; died, February 18, of carbon monoxide poisoning.

**William Zitron** ☉ Merrick, N. Y.; University and Bellevue Hospital Medical College, New York, 1928; aged 32; died, March 1, in the New York Hospital, of agranulocytosis.

**Harry Dash Johnson** ☉ Daytona Beach, Fla.; Bellevue Hospital Medical College, New York, 1897; member of the state board of health; aged 59; died, February 27.

**Joseph Myers**, Albany, Ore.; College of Physicians and Surgeons, Keokuk, Iowa, 1866; Civil War veteran; for many years city health officer; aged 95; died, February 10.

**Ruth Meitin**, Chicago; Rush Medical College, Chicago, 1935; aged 24; assistant in the radiologic department of Billings Hospital, where she died, March 16, of pneumonia.

Lemon R. Markley, Bellingham, Wash.; Omaha Medical College, 1883; for many years city health officer and member of the board of health; aged 76; died, February 11.

Robert Innis Bromley, Sonora, Calif.; University of California Medical Department, 1882; aged 79; died, February 1, of bronchopneumonia, nephritis and arteriosclerosis.

William Ness, Westmount, Que., Canada; L.R.C.P., Edinburgh, L.R.C.S., Edinburgh and L.F.P.S., Edinburgh, 1903; aged 58; died in February, of pneumonia.

Thomas H. Duckett, Lamar, Mo.; Kansas City Medical College, 1889; formerly member of the state legislature; aged 81; died, February 23, of thrombosis.

Lawrence Joshua Davis, Dixons Mills, Ala.; Medical College of Alabama, Mobile, 1895; aged 62; died, February 11, of disease of the prostate gland.

William H. Wallace, Callery, Pa.; Homeopathic Hospital College, Cleveland, 1884; aged 72; died, February 20, of cerebral hemorrhage and arteriosclerosis.

William N. Bragg @ Reading, Ohio; Medical College of Ohio, Cincinnati, 1897; aged 68; died, February 21, of myocarditis and coronary thrombosis.

William D. Delzell, Springfield, Mo.; St. Louis Medical College, 1877; formerly member of the state legislature; aged 91; died, February 9.

Alfred P. Stoddart, Orangeville, Pa.; Hahnemann Medical College of Philadelphia, 1880; aged 78; died, February 6, of cerebral hemorrhage.

Jacob D. Richer, Warsaw, Ind.; Hahnemann Medical College and Hospital, Chicago, 1896; aged 69; died, February 28, of arteriosclerosis.

John G. Biller, Spadra, Calif.; Detroit Medical College, 1884; aged 76; died, February 24, of diabetes mellitus and arteriosclerosis.

Charles Kelsey Osborne, Dayton, Wash.; Denver College of Medicine, 1899; aged 63; died, February 17, of a self inflicted bullet wound.

John Harvey Carr, Maynardville, Tenn.; University of Tennessee Medical Department, Nashville, 1900; aged 63; died, February 27.

Dugald D. Munro @ Kinde, Mich.; Detroit College of Medicine, 1891; aged 70; died, February 22, of acute dilatation of the heart.

George Robert Waite, Kiowa, Kan.; Illinois Medical College, Chicago, 1901; aged 59; died, February 27, of cerebral hemorrhage.

John W. Taylor, Luthersville, Ga.; Atlanta Medical College, 1875; postmaster; aged 81; died, February 25, of lobar pneumonia.

William H. Green Jr., Newark, N. J.; Long Island College Hospital, Brooklyn, 1912; aged 45; died, February 13, of acute nephritis.

Thomas S. Watson, Bevier, Mo.; Missouri Medical College, St. Louis, 1882; aged 78; died, February 10, of angina pectoris.

Charles W. Carter, Mount Pleasant, Iowa (licensed in Iowa in 1886); aged 83; died, February 2, of gangrene of the foot.

Thomas J. Woods, Evening Shade, Ark.; Kentucky School of Medicine, Louisville, 1876; aged 85; died, February 18.

Aaron Strashun, Cincinnati; Chattanooga (Tenn.) Medical College, 1895; aged 69; died, February 28, of myocarditis.

John A. McCorkle, Ponchatoula, La. (licensed in Louisiana in 1895); aged 77; died, March 8, of cerebral hemorrhage.

Paul Plez Cooper, Alma, Ga.; Hospital Medical College, Atlanta, 1911; aged 46; died, March 10, of heart disease.

William Reid, Wyoming, Ont., Canada; University of Toronto Faculty of Medicine, 1904; died, February 4.

Albert S. Kunin, Detroit; Detroit College of Medicine, 1928; aged 34; died, March 2, of morphine poisoning.

Walter John Graves, Brookline, Mass.; Boston University School of Medicine, 1899; aged 72; died, February 20.

Emma Connor, Belleville, Ont., Canada; University of Toronto Faculty of Medicine, 1902; died, February 16.

Jacob Ernest Gaddis, Beaver, Pa.; Jefferson Medical College of Philadelphia, 1888; aged 75; died, March 14.

William Francis Keppel, Brooklyn; Long Island College Hospital, Brooklyn, 1897; aged 61; died, February 8.

Frederick William Hill, Ottawa, Ont., Canada; Trinity Medical College, Toronto, 1903; died, February 25.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

### THYROTOXICOSIS DURING TREATMENT OF OBESITY

To the Editor:—A woman, aged 22, who has been married about six months, has always been from 10 to 20 pounds (4.5 to 9 Kg.) overweight. Tonsillectomy was done at 8 years of age, appendectomy recently. During the past eight months, she has noticed that she has gained more weight around the hips and thighs, the rest of the body remaining the same. She is 5 feet (152 cm.) tall and weighs 128 pounds (58 Kg.). Eighteen months ago she weighed 138 pounds (63 Kg.), but the excess was well proportioned over the entire body. Under rigorous dietary restriction for ten months she lost 16 pounds (7.3 Kg.). At present, in spite of moderate dietary restriction, she is gaining weight about the hips and thighs. The hands are small. The legs are well shaped and slender, as compared to the thighs. The breasts are fairly large and pendulous. There is no mental retardation, but the patient complains frequently of drowsiness and usually sleeps ten hours out of every twenty-four. She has a good appetite; there is slight constipation. The heart is normal, the pulse rate 90, the blood pressure 105 systolic, 70 diastolic. The patient is often very nervous and easily excited. She cries at the slightest provocation. There is occasional nausea and temporal headache. Menstrual periods occur regularly every twenty-six days with a fairly profuse flow, slight headaches and moderate dysmenorrhea. Menstruation began at 11, and the secondary sex characteristics appeared early. There is no frigidity, and the uterus is of normal size, though retroverted. The basal metabolic rate was minus 24 two and one-half months ago. She was put on desiccated thyroid, 1 grain (0.065 Gm.) three times a day for ten days, then 1 grain twice a day, for ten days, and 1 grain daily since that time. When the patient first began thyroid, the pulse went to 125 and she became more nervous. Thyroid was discontinued for one week and then started again. While she was taking 2 grains (0.13 Gm.) daily, her pulse was 110 and the nervousness continued. She has been taking 1 grain a day for the past six weeks. This causes her to be more nervous than normal; the pulse rate is 96. Her appetite is good, but the constipation continues, and despite a diet of 1,500 calories daily the patient is slowly and constantly gaining weight. Most of the gain in weight is taking place about the hips and thighs. The patient's mother and sister live in another town but are reported to be of the same type, except that the obesity is much more marked, especially around the hips and thighs, and, in the mother, also around the shoulders. Their basal metabolic rates are also low, and thyroid medication has been ineffectual in their cases also. Is this a case of pituitary obesity? Do you think that pituitary lobe preparations should be given? What type would you suggest? Should dietary restrictions and thyroid be discontinued? I assure you that I will appreciate your help in this matter. Kindly omit name and town.

M.D., Texas.

ANSWER.—Although the "girdle obesity" has sometimes been ascribed to ovarian dysfunction, there is nothing in the description of this case from which a diagnosis of "endocrine obesity" can be made. The endocrine balance that determines the physical type or constitution of the individual, like the physiognomy, is an inherited attribute. The description of the mother and the sister makes it seem probable that the patient's difficulties as regards the distribution of fat arise not from her own glands but from those of her ancestors. Unfortunately our present knowledge of endocrinology is as yet inadequate to cope with the problem of the redistribution of local fat depots.

As contrasted with the distribution of adipose tissue, the problem of total overweight is much simpler. The patient is either sensitive to thyroid or she is taking more of it than has been prescribed. At any rate she is suffering from overdosage of this substance. In addition, she is consuming sufficient food to gain weight in spite of her increased metabolic rate. The administration of thyroid should be stopped, and the substitution of any other glandular preparation or medication is not recommended. The basal metabolic rate of minus 24 observed two and one-half months ago does not necessarily indicate a hypothyroidism. It should be remembered that the normal variation in the basal metabolic rate is as low as minus 15. The fact that the method of calculating the basal metabolic rate renders the values for overweight individuals falsely low, by assuming a normal proportion of active to inert tissue, should also be taken into account. It is possible that a recalculation of the metabolic reading on the basis of the ideal rather than the actual weight would result in a value within the normal range.

Regardless of the state of her endocrine glands, the proper reduction of the patient depends on decreasing the caloric intake below the level of the energy output. In such cases as this it is often wise to hospitalize the patient so that the effects of a known and measured caloric intake can be demonstrated for

the benefit of both patient and physician. When it has been demonstrated to the patient that she can reduce on a correct dietary regimen, and after she has been reduced to her proper weight, the permanence of the cure depends on whether the patient has acquired a good "food habit" for her previous bad one.

#### URTICARIA

*To the Editor:*—A white woman, aged 39, has chronic urticaria. This first developed during a vacation in August while the patient was at a Minnesota lake region, and she believes that she may have contracted her hives from swimming. There is no history of previous allergic phenomena. She is married and has a normal child 16 years of age. General physical examination is essentially negative except for urticarial lesions and secondary lesions due to scratch marks. There is apparently no source of the urticarial origin to be found in the sinuses, lungs, gall-bladder or thyroid. Laboratory examinations, including Wassermann, blood, urine and stools, are negative. The numerous patch tests have not been run as yet. Since the original severe attacks following her vacation in August the condition has improved; however, there are some lesions present almost daily, with exacerbations varying at times to a moderate angioneurotic edema. In addition to symptomatic therapy the patient has been on calcium, acid, alkali and quinine therapy. I have also tried typhoid vaccine and autohemotherapy as nonspecific measures. The patient has likewise been on Rowe's eliminative diets, with no improvement. She is using the so-called nonallergic cosmetics. All methods of therapy have been only of transient benefit. Is it possible that she may have acquired this urticaria from swimming? If so, why does the urticaria persist? Have you any further suggestions as to therapy? Should I perform the numerous patch tests? If so, is it probable that these will be of slight benefit in determining the specific allergen? Would the specific allergen be more apt to be found in dust rather than the food groups? Please omit name.

M.D., North Dakota.

*ANSWER:*—It is unlikely that the urticaria in this case is related to swimming. The cause of the condition should be looked for in foods and possibly drugs, since these are the commonest factors in urticaria. Tests should be done, preferably by the intracutaneous method rather than by the scratch method, since the former is more likely to give positive reactions. Patch tests seldom are indicated in urticaria, even if the condition is due to environmental substances. Positive reactions are obtained in about 50 per cent of the cases tested intracutaneously. Even when a test is positive, its clinical significance must be determined both by elimination and by observation of the effect of the material on the patient. If tests are negative, a careful food diary may be of help. The foods eaten within twelve hours preceding the onset of an attack, and especially those of the meal preceding the attack, should be recorded. After a number of meals, eaten before the onset of attacks, have been recorded, an analysis of the foods common to all these meals frequently gives a clue to the cause of the condition.

Regarding additional therapy, nonspecific treatment with stock vaccines has been used, with the report of some success in persistent cases.

#### INJURIOUS EFFECT OF CHLORINE IN PAPER MILL

*To the Editor:*—Please send to me at once any available data that you may have on the effect of the so-called bleach gas, which is produced in the process of manufacture and bleaching paper manufactured in Wisconsin mills, of rag content. I am particularly interested in the effect and its probable relation or cause of bronchial asthma and its likelihood of relation to a first attack after a short exposure.

M.D., Wisconsin.

*ANSWER:*—The bleaching agent in Wisconsin paper mills devoted to rag paper manufacture is likely to be chlorine derived from chlorinated lime. In other Wisconsin mills engaged in the manufacture of paper from wood pulp, sulfur dioxide, a bleaching agent, might be present, but primarily from the sulfite process and not from any direct use as a bleach. As little as 15 parts of chlorine per million of air will produce immediate irritation of the throat. Indefinite exposure should not be permitted when concentrations are in excess of 1 part of chlorine per million. Chlorine is nearly twenty times as toxic as hydrochloric acid, and certainly no doubt can be entertained as to its immediate action in bringing about prompt respiratory inflammation and pulmonary edema. But for a long time dispute has raged over the remote effects of chlorine gassing. Apparently one single severe gassing, such as commonly takes place in warfare, is followed by acute episodes including severe immediate sequelae; but, if recovery from the acute effects is once procured, no permanent damage is expectable. Apparently this is not true for industrial exposures in which day by day the inhalation of relatively low concentrations occurs. Some such exposed workers may develop emphysema, chronic bronchitis or bronchial asthma. The new worker when first exposed may be much more susceptible to the action of the gas than longer exposed workmen. After a

short time the new worker may accommodate himself to the injurious gas, but later in the course of months or years chronic manifestations may arise. It is possible that some workers become sensitized through the action of chlorine, but naturally the sensitization is not to the chlorine itself. The irritating action of the chlorine prepares the respiratory tract for sensitization by bacteria, or perhaps by new protein forms, produced by the chlorine in contact with the tissues of the breathing apparatus. The occurrence of injurious effects from exposure to chlorine in a paper mill is well within the realm of possibility.

#### POSTPARTUM ADYNAMIC ILEUS

*To the Editor:*—Recently I had a case of what appeared to be postpartum adynamic ileus. Do you feel that the condition is apt to recur in a succeeding postpartum period? The patient is a primipara. She presented other evidences of an unstable autonomic nervous system; viz., at the end of the first stage her blood pressure dropped to about 50 systolic and her pulse reached about 140. Her heart and lungs were apparently normal. There was no apparent bleeding and no evidence of concealed hemorrhage. The labor, under pentobarbital-scopalamine analgesia, had been relatively easy and short, and the analgesia had been satisfactory. As soon as it was recognized that the patient was in a condition of shock, the patient was rapidly delivered by low forceps and intravenous administration of 10 per cent dextrose in 1,000 cc. of saline solution instituted. During the intravenous therapy, which lasted about one-half hour, the patient suddenly recovered from the analgesia (and the ether which she had had during delivery) and began to talk in a perfectly oriented, alert manner. Her blood pressure in the meantime returned to 130 systolic. The abdominal distention developed within twelve hours or so and was extremely resistant to all the usual measures to relieve it, until four days later, when it gradually subsided. The distention was apparently chiefly of the small bowel rather than of the stomach or the large bowel. Please omit name.

M.D., Montana.

*ANSWER:*—This case is interesting, but not sufficient data have been provided to make a positive diagnosis possible.

There are two elements, which may or may not be related: The shock during delivery may have been nervous or due to the effect of the drugs administered, or possibly an acute hyperinsulinemia with hypoglycemia. Paralytic distention of the bowel during and after delivery, while of rare occurrence is sufficiently common to require attention. During labor it is explained as some disturbance of the autonomic system. It has followed injury and contusion to the bowel when the bowel is crushed by the manipulations used to express the placenta, and when it occurs in the puerperium a variety of reasons are given: (1) the one just mentioned; (2) the regurgitation of blood from the uterus through the tube into the peritoneal cavity; (3) minute extravasations of blood in the uterine peritoneum as the result of crushing the uterus, or of a mild toxemia analogous to abruptio placentae; (4) mild peritonitis resulting from the stirring up of a latent tubal infection, or (5) simply the lack of counterpressure from flaccid abdominal muscles, there being reduced tone in the intestinal walls, permitting gas to accumulate in the bowel. The combination in this case of shock and abdominal distention makes one suspect something organic rather than functional.

#### THERAPEUTIC ABORTION FOR TUBERCULOSIS

*To the Editor:*—A secundipara, aged 21, with moderately advanced pulmonary tuberculosis, is apparently four and one-half months advanced in pregnancy. Is evacuation desirable medically or possible legally and if so through what formality? What is today considered the most reliable operative (abdominal) procedure to obtain permanent sterility? Under what conditions can such an operation be legally performed in Illinois? Please omit name.

M.D., Illinois.

*ANSWER:*—The legality of inducing abortion is not well established by statute in most states but it is generally accepted that therapeutic abortion is justifiable legally as a life-saving procedure. Usually the supporting opinion and advice of one or more consultants is deemed necessary for the protection of the surgeon who performs the operation and of the institution in which it is done.

There is no way of obtaining legal sanction for the performance of this therapeutic procedure. Medically it may be justifiable from the point of view of treatment, and it appears that the indications are being gradually extended to include not only conditions which are an immediate threat to life but also those diseases which are made worse by pregnancy and tend to shorten life.

As far as tuberculosis is concerned, there are varying opinions relative to the therapeutic value of abortion in arresting the progress of the disease. In general, one has to consider the reaction of the pregnant woman, but, as a rule, the pregnancy would be considered a handicap in managing a case of pul-

monary tuberculosis. Ordinarily if termination of the pregnancy seems desirable it should be done in the first trimester, and this period is one of the more serious so far as the indirect effect of the pregnancy on the tuberculous process is concerned. As a rule, the performance of an abortion for pulmonary tuberculosis after this period is not indicated.

Whether or not sterilization is justified depends on the prognosis for cure of the tuberculosis. Pregnancy is not believed to be desirable unless a cure has been established by a definite arrest of the disease processes. When a cure is not probable, sterilization is indicated; but consent of both husband and wife is necessary.

When therapeutic abortion and sterilization are both indicated, abdominal hysterotomy and tubal resection are desirable methods. Some form of tubal resection is the best form of sterilization. The uterine cornua may be excised with the proximal portion of the tube. The Madlener technic of crushing and tying the tubes is simple and quite efficacious, though some failures have resulted.

There is no mechanism by which legal permission may be obtained for the performance of an operation for sterilization in Illinois. The only protection is the following of justifiable medical indications and the securing of the consent of both husband and wife.

#### TREATMENT DURING MENOPAUSE

To the Editor:—Kindly outline a treatment for menopausal symptoms. What is the value of theelin and theelol (Parke-Davis) medication on these symptoms? Please omit name. M.D., Chicago.

ANSWER.—Theelin and theelol are typical of the group of estrogenic substances which at present are being used in the treatment of "hot flushes," "nervousness," and insomnia associated with the menopause. Their use is based on the observed fact that after the menopause there may be decreased excretion of estrogenic substances. The inference is that menopausal vasomotor instability and similar menopausal symptoms are the result of a lack of estrogenic substance in the body. Many physicians believe that replacement therapy with the estrogenic group of drugs (theelin, theelol, amniotin, progynon, progynon-B) is an effective treatment of these subjective disorders of the menopause.

Seyringhaus finds that the dosage of the products used orally (theelol capsules, amniotin capsules, progynon tablets) must be about five times as large as that dosage of the preparations used for parenteral injection (theelin [aqueous], theelin in oil, amniotin in oil, progynon, progynon-B) to produce the same effect. He discusses the advantages of each type of medication and believes that the current cost of the drugs in equivalent dosage in terms of rat or of international units should be the deciding factor in selecting the product to be used. Treatment may be started with oral dosage of 100 or 200 rat units (or the equivalent in international units) daily and increased or decreased as the response warrants. In severe cases 50 rat units a day may be given parenterally. A mild sedative is a helpful adjuvant.

#### BLOOD PRESSURE CHANGES IN PREGNANCY

To the Editor:—A woman, aged 36, has had a blood pressure of 160 systolic, 90 diastolic, since she was 24 years old and during this time she has had three children, the youngest being 5 years old, and shortly after she has conceived her systolic pressure drops to from 124 to 130, but within a month after delivery it returns to 160. Can you advise me as to what secretion during pregnancy might account for this? Please omit name. M.D., Kansas.

ANSWER.—The phenomenon observed in this case is not infrequently encountered. An accurate explanation of the occurrence is difficult, if not impossible. One of the functions attributed to the pituitary is that of regulating the blood pressure. It is known that the ovary exerts some sort of counter regulatory effect on the pituitary. It is known that the ovarian secretion is altered during pregnancy and it therefore seems probable that such changes in blood pressure are due to some alteration in pituitary control. This statement, however, is not susceptible of proof of any sort and to be accurate one must say that it is impossible to say what secretion causes such blood pressure changes during pregnancy.

#### RETURN OF FUNCTION AFTER NERVE INJURY

To the Editor:—A woman fell from a step-ladder while hanging wallpaper in June 1935, and one leg went through a window. The glass was shattered and it severed the achilles tendon completely, also the posterior tibial artery and nerve, and another laceration severed the gastrocnemius muscle. The lacerations and achilles tendon were sutured. The posterior tibial nerve was also sutured end to end with fine black silk. The wounds healed without infection. However, the sensation has not yet returned to a small area on the plantar surface of the foot and the patient unwittingly burned this with a hot water bottle. The burn healed slowly but now from time to time what I believe are trophic ulcers develop here. What can be done to toughen the skin? Would it be wise to try a pedicle skin graft or might it not take? Any advice would be appreciated. M.D., Michigan.

ANSWER.—It is still too early for complete return of sensory and trophic function in the area of distribution of the divided posterior tibial nerve. We know of nothing that will "toughen" the skin when its nerve supply has been destroyed and would be reluctant to try any type of graft or flap to cover the open wounds. They would be subject to the same handicap as the tissues at the site of the open wound which are temporarily deprived of their nerve supply. A graft or flap can live only if it develops a blood supply at the site at which it is transplanted, and the innervation of the tissues at the site of the open wound is an important factor in vascular function.

The most important considerations in the treatment of the patient's condition at this time are rest, elevation of the limb, patience and, above all, every possible effort to prevent adding additional infection from the outside.

#### GONORRHEAL EPIDIDYMITIS

To the Editor:—Please give me the correct treatment for a case of gonorrheal epididymitis of five months' duration with slight enlargement of the epididymis but rather marked tenderness on palpation, slight enlargement of the inguinal glands, and prostatitis, which has about cleared under weekly massage. A small amount of purulent discharge remains. The seminal vesicles were involved but seem to have recovered under weekly strippings. 1. Would gonococcus filtrate (Corbus-Ferry) be likely to be of benefit in this case? 2. May strenuous exercise be permitted? 3. What is the status of 1:5,000 aqueous solution of metaphen as a urethral injection? 4. Do you recommend intravesical irrigations? If so, with what solution? 5. Is bimonthly intercourse likely to prolong the infection indefinitely? 6. Is there still much likelihood of an arthritis developing? Please omit name and city. M.D., Indiana.

ANSWER.—1. The benefit obtained from a gonococcus filtrate is questionable, but it might be tried.

2. Strenuous exercise should not be permitted in any infection of the genital tract.

3. This solution is of no more value in treatment than any of the other injections, such as the silver salts, which have stood the test of time.

4. Intravesical irrigations could be of little value in the treatment of a case like this.

5. All intercourse should be omitted in all cases of infection of the genital tract until the infection is cleared up.

6. There is always a possibility of arthritis complicating an infection of the genital tract.

#### ADVANTAGES OF HOMOGENIZATION OF INFANT FOODS

To the Editor:—Does homogenization in your opinion add much to digestibility? STANLEY NICHOLS, M.D., Long Branch, N. J.

ANSWER.—Ready prepared homogenized vegetables, fruits and cereals are now being marketed. The process is advocated because it breaks down the cellular envelopes and fibrous material. This allows more rapid and complete exposure to gastric and intestinal secretions, thereby hastening the process of digestion and at the same time facilitating more complete absorption of food elements. The more complete breaking down of fibrous bulk produces less mechanical irritation to the intestinal tract. Such finely divided foods are of primary advantage in the feeding of young infants and certain older children and adults needing a readily assimilated and nonirritating diet.

Prior to 1915, vegetables were a late addition to the infant's diet, usually being added toward the end of the second year or later. Well cooked and finely sieved vegetables have gradually been added at earlier dates, until now it is customary to give them between the fifth and sixth months of the first year. The importance of vegetables from a nutritional standpoint makes this earlier inclusion in the diet desirable. One of the chief difficulties of feeding them at an early age has been the resultant mechanical irritation. Homogenization attempts to overcome this difficulty.

## QUININE SULFATE AND ABORTION

To the Editor—Will you please give me the consensus as to whether quinine sulfate will cause abortion. Dr. De Lee states in his textbook that in conjunction with castor oil it will induce labor in about 30 per cent of cases at term, but he does not mention it as a method of inducing abortion. I have recently attended a case of abortion in which quinine had been used in the treatment of a cold. From all indications the fetus had died prior to the administration of the quinine, though the patient thinks that to be the cause. Please omit name if published.

M D, Kentucky

ANSWER—Opinions are unequally divided regarding the effect of quinine on pregnancy. Most accoucheurs who practice in malarial districts use quinine regularly and freely and report that it does not produce abortion, on the contrary, they think that it prevents abortion in malarious gravidas. At the end of pregnancy, quinine seems to sensitize the uterus, and on rare occasions it may induce labor by itself, also it may strengthen the pains to a pathologic degree, but this is uncommon.

As a method of inducing abortion, even when given in large doses, it has failed, and in all probability some other cause must be sought in the case mentioned.

## USE OF CHOLERETIC IN ABSENCE OF GALLBLADDER

To the Editor—A contradiction in your column of the February 8 issue cannot go unnoticed. In your answer to the inquiry of Dr. R. Barr of Grand Rapids, Mich., the dose of a chologogue was given for use in a patient who did not have a gallbladder. This therapy strikes me as being as efficacious as the administration of a pituitary like product would be in a woman who has had a panhysterectomy. Certainly if the intrahepatic and extrahepatic bile ducts needed treatment in this particular case, the Council accepted Decholin—the true choleretic—would at least have been indicated and certainly clinically beneficial.

ZACHARY BLIER, M D, Chicago

ANSWER—Sodium taurocholate is, like "decholin," "glyco-tauro" and other bile salt preparations, a substance that stimulates the secretory activity of the liver. It is a true choleretic and, as such, can act even when the gallbladder is absent.

## SKIN TEST FOR BRUCELLA ABORTUS INFECTIONS

To the Editor—In connection with an article on "The Prevalence of Mild Brucella Abortus Infections," by W. Beecher Scoville, which appeared in THE JOURNAL, Dec 14, 1935, I should like to know where material for skin testing can be obtained.

JOHN B. BEESON, M D, Wooster, Ohio

ANSWER—Brucella melitensis (abortus) vaccine (N N R) may be used for skin testing. This vaccine is available through the usual trade sources.

## Council on Medical Education and Hospitals

### ADDITIONAL HOSPITALS APPROVED

The Council on Medical Education and Hospitals of the American Medical Association has given its approval to the following hospitals since the publication of the last previous list in THE JOURNAL, March 7, 1936.

#### Hospitals Approved for Intern Training

Brewster Hospital, Jacksonville, Fla.  
St. Vincent's Hospital, Jacksonville, Fla.  
Lutheran Memorial Hospital, Chicago  
Cambridge City Hospital, Cambridge, Mass.  
Dallas Methodist Hospital, Dallas, Texas  
St. Mary's Hospital, Racine, Wis.

#### Hospitals Approved for Residencies in Specialties

Children's Hospital, Birmingham, Ala. Pediatrics  
Mary's Help Hospital, San Francisco. Surgery  
Eloise Hospital for Mental Diseases, Eloise, Mich. Neuropsychiatry  
St. Joseph Hospital, Kansas City, Mo. Pathology  
St. John's Hospital, Brooklyn. Pathology  
Mar. Immaculate Hospital, Jamaica, L. I. N. Y. Pathology  
State Hospital for Crippled Children, Elizabethtown, Pa. Orthopedics  
Hahnemann Hospital, Philadelphia. Anesthesia

#### Hospitals Approved for Additional Residencies

Provident Hospital, Chicago. Pathology  
Methodist Episcopal Hospital, Indianapolis. Anesthesia  
Harlem Hospital, New York City. Pathology  
Metropolitan Hospital, New York City. Orthopedics  
Watts Hospital, Durham, N. C. Medicine  
Geo. F. Geiswiler Memorial Hospital, Danville, Pa. Otolaryngology  
Rhode Island Hospital, Providence, R. I. Anesthesia and cardiology  
John Sealy Hospital, Galveston, Texas. Medicine and neuropsychiatry

## Medical Examinations and Licensure

### COMING EXAMINATIONS

#### STATE AND TERRITORIAL BOARDS

ALABAMA, Montgomery, June 23-25. Sec., Dr. J. N. Baker, 519 Dexter Ave., Montgomery.  
ARIZONA, Basic Science. Tucson, June 16. Sec., Dr. Robert L. Nugent, Science Hall, University of Arizona, Tucson. Medical. Phoenix, July 7-8. Sec., Dr. J. H. Patterson, 826 Security Bldg., Phoenix.  
CALIFORNIA, San Francisco, July 6-9, and Los Angeles, July 20-23. Sec., Dr. Charles B. Pinkham, 420 State Office Bldg., Sacramento.  
COLORADO, Denver, July 7. Sec., Dr. Harvey W. Snyder, 422 State Office Bldg., Denver.  
CONNECTICUT, Basic Science. New Haven, June 13. Prerequisite to license examination. Address State Board of Healing Arts, 1895 Yale Station, New Haven. Medical (Regular). Hartford, July 14-15. Endorsement. Hartford, July 28. Sec., Dr. Thomas P. Murdock, 147 W. Main St., Meriden. Medical (Homeopathic). Derby, July 14. Sec., Dr. Joseph H. Evans, 1488 Chapel St., New Haven.  
DELAWARE, July 14-16. Sec., Medical Council of Delaware, Dr. Joseph S. McDaniel, Dover.  
DISTRICT OF COLUMBIA, Washington, July 13-14. Sec., Commission on Licensure, Dr. George C. Ruhland, 203 District Bldg., Washington.  
FLORIDA, Jacksonville, June 15-16. Sec., Dr. William M. Rowlett, P. O. Box 786, Tampa.  
GEORGIA, Atlanta, June 10-11. Joint Sec., State Examining Boards, Mr. R. C. Coleman, 111 State Capitol Atlanta.  
HAWAII, Honolulu, July 13-16. Sec., Dr. James A. Morgan, 48 Alexander Young Bldg., Honolulu.  
ILLINOIS, Chicago, June 23-26. Superintendent of Registration, Department of Registration and Education, Mr. Homer J. Byrd, Springfield.  
INDIANA, Indianapolis, June 23-25. Sec., Board of Medical Registration and Examination, Dr. William R. Davidson, Room 5 State House Annex, Indianapolis.  
IOWA, Basic Science. Des Moines, July 14. Sec., Prof. Edward A. Benbrook, Iowa State College, Ames.  
KANSAS, Topeka, June 16-17. Sec., Board of Medical Registration and Examination, Dr. C. H. Ewing, 609 Broadway, Larned.

RHODE ISLAND, Providence, July 2-3. Chief, Division of Examiners, Mr. Robert D. Wholey, 366 State Office Bldg., Providence.  
SOUTH CAROLINA, Columbia, June 23. Sec., Dr. A. Earle Boozer, 505 Saluda Ave., Columbia.  
SOUTH DAKOTA, Rapid City, July 21-22. Dir., Division of Medical Licensure, Dr. Park B. Jenkins, Pierre.  
TEXAS, Austin, June 23-25. Sec., Dr. T. J. Crowe, 918-19-20 Mercantile Bldg., Dallas.  
UTAH, Salt Lake City, July 10. Dir., Department of Registration, Mr. S. W. Golding, 326 State Capitol Bldg., Salt Lake City.  
VERMONT, Burlington, June 24. Sec., Board of Medical Registration, Dr. W. Scott Nay, Underhill.  
VIRGINIA, Richmond, June 18-20. Sec., Dr. J. W. Preston, 28½ Franklin Rd., Roanoke.  
WASHINGTON, Basic Science. Seattle, July 9-10. Medical. Seattle, July 13-15. Dir., Department of Licenses, Mr. Harry C. Huse, Olympia.  
WEST VIRGINIA, Bluefield, July 13. State Health Commissioner, Dr. Arthur E. McClure, Charleston.  
WISCONSIN, Milwaukee, June 30-July 3. Sec., Dr. Robert E. Flynn, 401 Main St., La Crosse.  
WYOMING, Cheyenne, June 8. Sec., Dr. G. M. Anderson, Capitol Bldg., Cheyenne.

#### NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS. Parts I and II. June 22-24 and Sept. 14-16. Ex. Sec., Mr. Everett S. Elwood, 225 S. 15th St., Philadelphia.

## SPECIAL BOARDS

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY: Written examination and review of case histories of Group B candidates will be held in various cities in the United States and Canada Nov. 7. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh (6).

AMERICAN BOARD OF OPHTHALMOLOGY: New York, Sept. 26. All applications and case reports must be filed sixty days before date of examination. For information write to Rm. 2021, 58 E. Washington St., Chicago.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY: Cleveland, Jan. 9. Sec., Dr. Fremont A. Chandler, 180 N. Michigan Ave., Chicago.

AMERICAN BOARD OF PEDIATRICS: Albany, N. Y., June 10, Baltimore and Cincinnati in November. Sec., Dr. C. A. Aldrich, 723 Elm St., Winnetka, Ill.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY: New York, Dec. 29-30. Sec., Dr. Walter Freeman, 1028 Connecticut Ave., Washington, D. C.

AMERICAN BOARD OF RADIOLOGY: Cleveland, Sept. 25-27. Sec., Dr. Byrl R. Kirklin, Mayo Clinic, Rochester, Minn.

## North Dakota January Report

Dr. G. M. Williamson, secretary, North Dakota State Board of Medical Examiners, reports the examination held in Grand Forks, Jan. 7-10, 1936. The examination covered 13 subjects and included 100 questions. An average of 75 per cent was required to pass. Six candidates were examined, all of whom passed. Four physicians were licensed by reciprocity and 2 physicians were licensed by endorsement. The following schools were represented:

School	PASSED	Year Grad.	Per Cent
Rush Medical College.....	(1935)		84.9
University of Louisville School of Medicine.....	(1934)		84
University of Michigan Medical School.....	(1934)		89.5
University of Minnesota Medical School.....	(1929)		85.5
University of Manitoba Faculty of Medicine.....	(1934)		85.3
McGill University Faculty of Medicine.....	(1933)		86.1

School	LICENSED BY RECIPROCITY	Year Grad.	Reciprocity with
Chicago Homeopathic Medical College.....	(1889)		Illinois
State University of Iowa College of Medicine.....	(1926)		Iowa
University of Minnesota Medical School.....	(1933)		Michigan
St. Louis University School of Medicine.....	(1933)		Missouri

School	LICENSED BY ENDORSEMENT	Year Grad.	Endorsement of
Northwestern University Medical School.....	(1935)		N. B. M. Ex.
University of Minnesota Medical School.....	(1934)		N. B. M. Ex.

## Book Notices

*Your Child in Health and in Sickness.* By Hugh L. Dwyer, M.D., Associate Professor of Pediatrics, University of Kansas. Cloth. Price, \$2.75. Pp. 333, with 38 illustrations. New York & London: Alfred A. Knopf, 1936.

This popular presentation of the home care and feeding of infants and young children "is an attempt to guide the mother to a correct understanding of present day practice in the prevention of diseases in childhood." The advice is sound but too general to be of real help to mothers. The book abounds in technical terms without a glossary. Many of the expressions are colloquial, "fat goes to produce heat" (p. 131); "vitamin C is better understood" (p. 179); "weighing and measuring campaigns" (p. 187); "the infant does not localize pain well" (p. 290). The statement that "this is the most complete book on the care and feeding of children that has as yet been written" is not borne out by its contents. Among the topics lacking are training in the control of bowel and bladder function; home treatment of bad breath, toothache, hiccup, croup, sunburn, frostbite, cat and dog bites; preparation of poultices; the nature of delayed speech, enlarged thymus; differentiation of body build; the management of obesity; home exercises; desirable vacations. The index is inadequate if intended for mothers "looking for help."

Chapter I fails to stress early antepartum supervision. The expression "well balanced diet" (p. 7) has no meaning to the public without explanation and example. Contrary to the author's contention (p. 7), carbohydrates are favorable for the expectant mother in the management of vomiting in pregnancy. "Slow convalescence after the birth of the baby" (p. 8) is not necessarily due to vitamin deficiency. "The first breath" does not "purify the blood" (p. 17). "Complemental feeding" does not "interfere with the natural establishment of the breast milk supply" (p. 21). "Closing of the anterior fontanel before the end of the first year" is not "indicative of some disturbances in the mental development" (p. 61), for many infants

on antirachitic and base-forming feeding normally show closure before the end of the first year. "The most tangible evidence of progress during the first months of life" is not "the gain in weight" (p. 66), for many other criteria of physical and mental growth are equally significant. There are more important causes of delayed walking than "poor nutrition, weak feet or some recent illness" (p. 70). "Sugars and starches" are not "conductive to the development of poor tooth structure" (p. 76). The criteria of normal physical development (p. 81) are inadequate. "Articles of diet" will change "the breast milk in such a way as to have a deleterious effect on the child" (p. 93) if he is allergic. "Tubercular germs" (p. 120) is a misstatement. "Acid milk is more digestible because cow's milk contains buffering substances which must be buffered in the infant's stomach" (p. 122) is meaningless even to a physician; nor is it correct to state that "buffering can be accomplished by adding lactic acid to the milk before feedings" (p. 122). Contrary to the author (p. 132), minerals are as important in the diet of children as in that of infants. Adolescents, for example, gain markedly in their bony structures. "Dental caries" does not necessarily "occur early in children whose diet is deficient in calcium" (p. 132). On the other hand, dental caries may develop even with the adequate intake of vitamin D. Contrary to the author (p. 133), water given freely with meals interferes with mastication, digestion and the intake of food. The discussion on dehydration is needlessly technical (p. 161). Any pediatrician's practice attests the mother's need of more than a fragmentary statement on the "child who will not eat" (p. 171).

Chapter XIII is wholly inadequate on the emotional development of children. The author is amiss about certain psychologic problems as, for example, truthfulness in children (p. 221). There is less material on forming good habits than on preventing bad habits. The treatment of breath holding spells (p. 227) is ancient. The elaborate vaccination technic (p. 266) is intended for physicians, not mothers. The author feels too hopeless about the management of rheumatic diseases (p. 304). The roentgenogram of a nail in the lung is too terrifying to a frightened mother (p. 324). The author recommends zinc stearate powder in the chapter on infancy and yet at the end of the book (p. 327) states that "because it is so poisonous when drawn into the lung, other powders should be used instead of zinc stearate."

*Medical Mycology: Fungous Diseases of Men and Other Mammals.* By Carroll William Dodge, Ph.D., Mycologist, Missouri Botanical Garden, St. Louis. Cloth. Price, \$10. Pp. 900, with 142 illustrations. St. Louis: C. V. Mosby Company, 1935.

The title of this monograph is misleading. The author is not a physician. His references to the medical aspects of mycoses are incidental and brief. The pathology, diagnosis, prognosis and treatment of the diseases arising from fungous infections are not discussed or at the most only briefly noted. The author is not culpable in this, however, but this condition arises as a result of the undeveloped state of this important field of medical science. As one scans the 160 pages of bibliography which the author has painstakingly perfected the critic finds abundant evidence of the scrappy, inadequate, incomplete and all too often duplicating nature of the professedly original contributions to this field. The real fault lies in the defect in medical education. Bacteriology alone dominates the entire field of infectious and communicable diseases and many, if not all, of those teaching it have never had any training at all, or at the most an inadequate one, in the field of mycology. The situation is even less satisfactory in the training of laboratory technicians.

The inadequacy of current information on the polymorphisms, reproduction, cytology, cultural requirements, pathology and serology of the pathogenic fungi are all too apparent in the contents of this monograph by an expert. There is clearly a lack of concerted attack on any one of the important fungous diseases of man. Possibly this is due to the relative absence of lethal infections, to the superficial sites of the major regions of attack, and to the lack, heretofore, of any comprehensive monograph available for the accurate identification of the major fungous pathogens.

The book here presented attempts to meet this need. It is a systematic handbook of the pathogenic fungi of mammals, with

an all too brief outline of their morphology, life history, physiology, culture, isolation, and the microscopic technic essential to their study. A chapter on botanic nomenclature is inserted to warn off medical multipliers of more synonyms of supposedly more new species of fungi. The long tables of such synonyms appearing after the present names of the better known pathogens bear witness to the difficulties of those who faced the problem with an inadequate knowledge of a confused and often contradictory literature.

There is a systematic classification of the orders, families, genera, species and varieties of fungous pathogens of man and other mammals, largely his domesticated and laboratory stock. Each species or variety has a bibliographic synonymy, brief morphologic description, statement of cultural requirements and results, source or organs infected, and, in a few instances, brief references to the pathologic consequences. Only a few (all too few) are figured. Possibly the author knows how misleading a reliance on a single set of figures may be to the clinician or novice.

In view of the resistance of fungus spores, their extreme viability, their wide distribution and the ease with which they contaminate water, food, the air and everything we touch, it is to be expected that almost any pathologic tissue accessible to these agencies might easily become a culture medium of some contaminating fungus. The culturist of fungi himself must use many precautions in isolating the real cause of a mycosis.

The physician using this monograph must make his own index of infected organs, symptoms and diseases. Mycologists will find this monograph a great boon. All others must become mycologists in order to use it. Thus in time, perhaps a long time, a scientific medical mycology of the skin, hair, nails, ears, gums, tonsils, lungs, intestine, genitals, kidneys and lymphatics may eventually emerge. It can be built on this reliable foundation. This book should be a boon to dermatologists, a great stimulus to new investigation and an indispensable aid in accurate diagnoses, mainly by cultural methods.

**Foundations of Short Wave Therapy: Physics—Technics—Indications.** An Introduction to the Physico-Technical Principles and Medical Applications of Short Electric Waves for Physicians and Biologists. Physics and Technics by Wolfgang Holzer, Dr. Ing., Assistant in the Physiological Institute of the University of Vienna. Medical Applications by Eugen Weissenberg, Dr. Med., Medical Superintendent of the Short Wave Section of the University Clinic for Nervous and Mental Diseases in Vienna. Translated by Justina Wilson, F.R.C.P., D.M.R.E., and Charles M. Dowse, B.Sc., A.M.I.E.E. Cloth. Price, 12s. 6d. Pp. 228, with 53 illustrations. London: Hutchinson's Scientific and Technical Publications, 1935.

This book has been prepared in an attempt at collaboration between physicist and physician on the subject of "short wave therapy." The first 155 pages are devoted to a highly technical dissertation on the physics of short wave diathermy, and the text contains a mass of formulas which, though of probable interest to the highly trained physicist, will prove unintelligible to the average physician.

This first section, written by Holzer, the physicist, deals with the theory of oscillation, the action of electrical oscillations and the technic of short wave measurements and short wave therapy. The author favors the electronic valve generator over the spark gap generator. Holzer presents excellent studies on the electrical fields produced by short radio waves and brings out the significant point with regard to absorption of energy that "wavelengths from 10 meters to 1 meter indicate that the heating output is approximately independent of the specific resistance of the treated material." Holzer claims, therefore, that "the heating effects in all organs will be the same." He further points out that, theoretically, there appears to be little hope of producing a selective effect on different tissues by varying wavelengths. Methods of screening the apparatus to prevent radio interference are discussed. Finally, it is interesting to note that it is recommended that the apparatus for generation of short radio waves to be used by the practitioner "should be capable of providing wavelengths from 3.5 to 15 meters." Practically all the machines used at present by American practitioners produce short radio waves of a single wavelength, and machines capable of varying the wavelength are not available. One may agree with the author that "the output of the apparatus in the patient's circuit should be at least 100 watts, and a higher value, say 250 watts, is desirable."

The second section, written by Weissenberg, the physician, is devoted to medical applications of short wave diathermy. This section compares unfavorably with the first. The author seems unaware of the need for controlled clinical studies of large numbers of cases in any attempt to present the possibilities of a new form of therapy. He repeatedly cites only one or two case reports, with no controls to support his contentions. Weissenberg recommends a new form of low output apparatus with which he gives "weak therapy" treatments. In addition to producing heat energy in the tissues, he attributes to short wave diathermy a direct effect on the nervous tissues.

Despite the authors' conclusion that "short wave treatment—provided that indications and technic are correct—is absolutely without risk or danger" and that "it has proved to be extraordinarily efficient in the treatment of certain diseases," the presentation, particularly from the medical standpoint, does not entirely prove their contentions.

It is recommended that every physician practicing physical therapy attempt to struggle through the first portion of this work, which is devoted to physics; but he should read the second portion with some skepticism. Though it does not seem that the book will be of value to the average medical practitioner, it is an interesting contribution to the growing literature on the subject of short wave diathermy.

**History of The Canadian Medical Association, 1867-1921.** By H. E. MacDermot, M.D., F.R.C.P. Cloth. Price, \$3. Pp. 209, with 9 illustrations. Toronto: Murray Printing Company, Limited, 1935.

The history of any organization is obviously the history of the men who have done most to create it. Dr. MacDermot begins his work with a survey of conditions of medical practice in Canada before 1867. He then discusses early attempts at the formation of the Canadian Association and finally its development at Quebec in 1867. The Quebec Medical Society took the chief initiative in the formation. It is interesting to learn that Dr. William Marsden, who was the active mover, was stimulated by visiting the meeting of the American Medical Association in Cincinnati in May of that year. After discussing the earliest annual meetings, the author summarizes the first twenty-five years and then the next two twenty-year periods. He pays special attention to the work of the association during the war, to the reorganization in 1921 and to the development of medical journals in Canada and of other medical organizations, and he concludes his work with studies of important personalities and the citation of committee reports, legislative regulation and similar matters. The appendix also includes a list of members in 1867 and a list of annual meetings. The book has a useful index.

**Short Wave Therapy and General Electro-Therapy.** By Heinrich F. Wolf, Consultant, Department of Physical Therapy, Mount Sinai Hospital, New York. Cloth. Price, \$2.50. Pp. 96, with 79 illustrations. New York: Modern Medical Press, 1935.

This small volume has been prepared for the purpose of "elucidating electrotherapy methods with the aid of pictures." There is a brief discussion of the technic of diathermy and of short wave diathermy. The author still retains the designation "short wave therapy" and does not use the Council on Physical Therapy's term "short wave diathermy." There are likewise brief discussions of hyperpyrexia by means of diathermy, and of the use of "low voltage and low frequency" currents. This is followed by brief descriptions of electrodiagnosis and the application of static electricity, ultraviolet radiation, minor electrosurgery and electrotherapy in otolaryngology and gynecology. The illustrations show methods of applying diathermy electrodes and short wave diathermy plates or coils. While this book is prepared for the "busy practitioner" who "cannot devote much time to theoretical or technical details," the entire presentation is so sketchy that it would seem that the practitioner might be led into many pitfalls. For instance, the author states that in the treatment of rickets by ultraviolet radiation "the entire body, the back and front alternately, is exposed to the light starting with three minutes at a distance of 3 feet, when using the mercury quartz vapor lamp or the carbon arc lamp." If the practitioner happened to be using one of the more powerful mercury quartz vapor lamps, which produce minimal erythema in thirty seconds at a distance of 3 feet, the dosage recommended by the author would be six times the

minimal erythema dose, and a severe burn might be produced. Again, in the discussion of "short wave therapy" the author states that the physiologic effect of short waves "differs from that of diathermy and radiant heat in that with the former the capillaries are dilated strongly and persistently, more than the arterioles and large veins." He presents no proof of this contention and it can hardly be supported by the present studies on the physiologic effects of short wave diathermy. While this small textbook will be of interest to physicians skilled in the use of physical agents in the treatment of disease, it falls far short of its avowed purpose of providing a simple explanation of the methods of application of various electrotherapeutic measures for quick reference by the general practitioner. Many of the methods of applying electric currents recommended by the author have not been thoroughly tested and accepted by practitioners as a whole. The general composition of this book is poor, there is no list of illustrations, the index is sketchy, and there are a number of misspelled words.

*Traité de physiologie normale et pathologique.* Publié sous la direction de G. H. Roger, professeur honoraire de physiologie à la Faculté de médecine de Paris, et Léon Binet, professeur de physiologie à la Faculté de médecine de Paris. Tome X: Physiologie nerveuse (deuxième partie). Par F. Bremer, et al. Fascicules 1 et 2. Boards. Price, 250 francs, per set. Pp. 981; 983-1,579, with 275 illustrations. Paris: Masson & Cie, 1935.

This large volume in two parts keeps up well the standard set by the previous issues of this ambitious work, although the different chapters are of unequal merit. Curiously enough, this monographic treatment of normal and pathologic physiology of the nervous system leaves out the cerebrum entirely, except as it comes in incidentally in the long detailed chapter on the cranial nerves. There is also considerable overlapping in the treatment of material; for example, there is a seventy page chapter on the physiology of the skin, in addition to a long chapter on the cutaneous senses. There is also considerable repetition in the two chapters on the cranial nerves and those on the special senses and the autonomic nervous system. The chapter (107 pages) on speech is really a monograph by itself, written by Professor Froment of Lyons. There is also more anatomy and histology than is usually included in the normal and pathologic physiology of the nervous system in British and American textbooks.

*A Diabetic Primer for Children.* By Ella M. Coleman, B.S., Assistant Dietitian at Mount Sinai Hospital, N. Y., and Alfred E. Fischer, M.D., Adjunct Pediatrician and Chief of the Children's Diabetic Clinic, Mount Sinai Hospital, N. Y. Paper. Pp. 42. New York: The Authors, [n. d.].

Small concise manuals for the diabetic of all ages are of great value. This booklet, the first of its kind for the juvenile patient, gives instructions concerning the principles of diet, metabolism and growth as well as methods of constructing diet, substitutions of foods, analyses of urine, technic and administration of insulin, and the management of coma and hypoglycemia. It could be used in the training of elderly as well as juvenile diabetic patients. Unfortunately, there is no reference to protamine insulin. The latent results of uncontrolled diabetes in childhood could have been emphasized. The authors wisely place the responsibility of treatment with the child.

*Width-Weight Tables for Boys and Girls from 1 to 16 Years; for Men and Women from 17 to 24 Years.* By Helen B. Pryor, M.D., Assistant Medical Examiner (Women), Stanford University. Paper. Price, 60 cents, single copy; 2 to 4 copies, 50 cents each; 5 to 9 copies, 40 cents each; 10 or more copies, 35 cents each. Pp. 15, with tables. Stanford University, California: Stanford University Press; London: Oxford University Press, 1936.

As the author states, the medical profession has long recognized the nutritional status as a factor in determining the state of health. Also the author points out the uselessness of depending on the height-weight-age tables. Then she substitutes a series of tables of her own. As in most of these tables, one cannot place too much dependence on the theoretical normals arrived at by measuring the length of a bone or the distance between two bones. These tables instead of one figure give seven, any one of which may be taken as the proper normal. This table may work well in the hands of experts such as the author, but in the hands of the practicing physician it is merely substituting a newer and more difficult formula for an older one.

*Pathopsychologie der Gefühle und Triebe: Ein Grundriss.* Von Dr. med. et phil. Kurt Schneider, Honorarprofessor an der Universität München. Paper. Price, 1.20 marks. Pp. 28. Leipzig: Georg Thieme, 1935.

This is an interesting little discussion dealing with the relationship of consciousness and instinct. It consists of a presentation of the author's own point of view, differing little from the psychologic functionalists, and stresses a classification of the various mental characteristics and their interrelationships. The first part deals largely with tabulations of sensory and emotional reactions, while the last half describes synthesis of the various traits in psychopathic and abnormal conditions as well as common characteristic and specific emotional states in them. It is an interesting theoretical contribution which is not particularly important.

*Don't Believe It! Says the Doctor. False Notions, Errors, Misconceptions and Misinformation Pertaining to Health and Hygiene. Major Ailments and Cancer, Minor Ailments and Remedies, Food and Diet, Mind and Senses, Body, Marriage and Death; and Health Fallacies Derived from Superstition and Folk-Lore, Explained and Corrected.* By August A. Thomen, M.D., Lecturer in Medicine, College of Medicine, New York University. With foreword by Harlow Brooks, M.D., Visiting Physician, City Hospital, New York. Cloth. Price, \$2.65. Pp. 348. New York: The Author, 1935.

The author has collected into a personally published volume a great deal of common sense material relative to health, but he offers it according to an exceedingly diffuse plan. In other words, by stating a negative on a well established superstition he gives himself opportunity for an extended discussion in the field of hygiene. The same data are much more easily available in better written form in many other currently published books on the subject of health and hygiene.

*Los fundamentos científicos y la práctica de la educación física.* Por el Dr. D. Rafael Alcalá Santaella, catedrático de la Facultad de medicina de la Universidad de Valencia. Paper. Price, 10 pesetas. Pp. 188, with illustrations. Madrid: Casa editorial Bailly-Bailliere, s. a., 1935.

This monograph emphasizes the importance of physical education in the development of a nation. Santaella asserts that the people of Spain need intensive physical training. His book is written primarily for individuals interested or actively engaged in physical education. There is first a summary of the anatomic structures of the human body. The physiology of respiration, the circulation, the nervous and muscular systems are reviewed. In the concluding section many exercises are described suitable to the proper development of the human body. These are the usual "setting-up exercises" taught in American schools.

*Creative Re-Education.* By Frederick Peterson, M.D., Ph.D., LL.D. Cloth. Price, \$1. Pp. 112. New York: G. P. Putnam's Sons, 1936.

The author of this book is one of the leaders in the field of psychiatry, a man who has contributed from time to time greatly to psychiatric knowledge. His knowledge of the subject and his cultural background are vast but are not indicated in the present volume. This is composed of a number of brief essays dealing largely with the principles of education, what schooling should do for persons, and short discussions on various psychologic traits, such as suggestion and the discovery of talents. It is largely cultural and does not have a very distinct bearing on the problems of medicine, even though written by a medical man. The style is flowing, scholarly, cultured, intelligent, but not very commanding. It should be of more interest to teachers than to physicians, although the latter, particularly mental hygienists, might read it for pleasure. One short essay, on occupational therapy, is significant for the psychiatrist.

*Food and Health.* By Henry C. Sherman, Mitchell Professor of Chemistry, Columbia University. Cloth. Price, \$2.50. Pp. 296. New York: Macmillan Company, 1934.

This is a simply written volume by an eminent authority who feels that the average intelligent person ought to have available correct knowledge relative to basic substances in the human diet. He therefore writes in easy-reading English, telling the facts concerning proteins, carbohydrates, fats, minerals, salts and vitamins. The book is printed in large type and offers in a brief space most of what everybody should know on this subject.

**Outposts of Science: A Journey to the Workshops of Our Leading Men of Research.** By Bernard Jaffe. Cloth. Price, \$3.75. Pp. 547, with 77 illustrations. New York: Simon & Schuster, 1935.

The author of this volume has visited many famous laboratories and talked with many famous investigators with a view to collecting first-hand impressions of current research. Among the medical items are those concerned with heredity in cancer, new work on the vitamins and new work on the glands. Mr. Jaffe approaches this subject as a young man with a frantic admiration for science, and his book is therefore stimulating and inspiring. It will be read with pleasure by every physician.

## Bureau of Legal Medicine and Legislation

### MEDICOLEGAL ABSTRACTS

**Compensation of Physicians: Liability for Medical Services Rendered to Tenants.**—The defendant owned and operated a farm on which resided a number of tenants or share-croppers. A Dr. Gephart had for a number of years prior to his death rendered medical services to the defendant and his tenants. The charges for the treatment rendered the tenants were entered in the card system kept by Dr. Gephart under the general entry "Doss Farm" and thereunder specifically to the tenants to whom the professional services were actually rendered. At various times, on receipt of statements of tenants' accounts from Dr. Gephart, the defendant promptly paid the sum called for therein. At the time of Dr. Gephart's death, there remained due him compensation for treatment rendered tenants of the Doss farm over a period of two years. To recover the unpaid balance, the executrix of Dr. Gephart's estate and a physician who had apparently been associated with the deceased brought suit against the defendant. From a judgment for the plaintiffs, the defendant appealed to the Supreme Court of Arkansas.

There was no testimony, said the Supreme Court, that Dr. Gephart rendered professional services to the tenants at the instance or request of the defendant. The charges made by Dr. Gephart in his bookkeeping system were in effect against the tenants and not against the defendant. The entry "Doss Farm," in the opinion of the court, was not a charge against the defendant but was merely an identification used for the purpose of locating the tenants against whom the charges were actually made. The mere fact that the defendant paid to Dr. Gephart sums due by his tenants would not render the defendant liable for all other sums not due, and neither would such circumstances be sufficient to infer a contract therefrom. The testimony, in the opinion of the Supreme Court, was wholly insufficient to show an original undertaking on the part of the defendant to pay for the professional services rendered to his tenants. There was, therefore, no substantial testimony to support the judgment for the plaintiffs, which was consequently reversed and the case dismissed. *Doss v. Gephart (Ark.)*, 88 S. W. (2d) 62.

**Malpractice: Death Under Anesthesia Attributed to Negligent Preoperative Examination.**—Two of the defendants, one the county health director and the other a specialist in diseases of the ear, eye, nose and throat, undertook to remove the tonsils of the plaintiff's 9 year old boy at a clinic conducted by them. During the administration of anesthesia by the third defendant, a lay employee of the specialist, the patient developed what the court referred to as "alarming symptoms" and, despite effort to revive him, died shortly thereafter. The plaintiff, as administrator of the estate of his deceased son, sued the three defendants. The trial court directed a verdict for the defendants, and the plaintiff appealed to the Court of Appeals of Kentucky.

The evidence tended to show that the plaintiff informed the defendants that his son had only recently recovered from influenza, and that he had "rheumatic fever" and "a rheumatic heart." Although the defendant physicians were in possession

of this information, it was contended, they proceeded with the operation without subjecting the boy to a thorough examination to determine his fitness to undergo it. The defendant physicians contended, on the other hand, that what they did was in accordance with the duties imposed by law on them and that the methods employed to ascertain the patient's condition were sufficient for the purpose. A duty devolved on the defendant physicians, said the court, to ascertain whether or not the patient's physical condition was such as to enable him to undergo or withstand any required action as a necessary part of the treatment proposed to be administered. A physician continued the court, who administers or procures the administration of an anesthesia preparatory to a surgical operation is required to possess the same degree of skill and has imposed on him the same obligations as were set forth in *Stevenson v. Yates*, 183 Ky. 196, 208 S. W. 820, as follows:

The law is well settled . . . that a physician or surgeon is answerable for an injury to his patient resulting from want of the requisite knowledge and skill, or from the omission to use reasonable care and diligence in the treatment of the patient or to exercise such care and diligence to discover the patient's malady. [Citations omitted.] Concerning the standard of knowledge and skill and the required care which the physician should possess and exercise under this rule, it is quite generally agreed that he is bound to bestow such reasonable and ordinary care, skill, and diligence as physicians and surgeons in similar neighborhood and surroundings engaged in the same general line of practice ordinarily have and exercise in like cases.

In the present case, said the court, more than one witness testified to facts which, if true, tended to show that the defendant physicians either did not possess the requisite skill to discharge the task they assumed to perform or that they negligently and carelessly exercised their skill. The sufficiency of the evidence to support a verdict either way on a general submission of the case to the jury was not before the court for determination. The sole question was whether the trial court correctly directed the verdict for the defendants. Before a court is authorized to direct a verdict, it should be prepared to say that, admitting as true all the testimony on behalf of the party against whom the verdict is directed; and every fair and reasonable inference that might be deducible from it, he has failed to make out his case. Applying that rule to the evidence in the present case, the Court of Appeals felt impelled to conclude that the trial court erred in directing the jury to return a verdict for the defendant physicians but correctly directed a verdict for the defendant lay anesthetist, since there was no proof that she was not competent to perform the task she undertook, or that she administered an excessive amount of the anesthesia. The judgment was affirmed as to the anesthetist but reversed with respect to the defendant physicians.—*Van Sant's Adm'r v. Overstreet (Ky.)*, 86 S. W. (2d) 1008.

### COMING MEETINGS

- American Association for the Study of Goiter, Chicago, June 8-10. Dr. W. Blair Mosser, 133 Biddle St., Kane, Pa., Corresponding Secretary.
- American Association for the Study of Neoplastic Diseases, Baltimore, June 11-13. Dr. Eugene R. Whitmore, 2139 Wyoming Ave. N.W., Washington, D. C., Secretary.
- American Pediatric Society, Bolton Landing, N. Y., June 11-13. Dr. Hugh McCulloch, 325 North Euclid Ave., St. Louis, Secretary.
- American Physiotherapy Association, Los Angeles, June 28-July 2. Miss Jefferson I. Brown, Tichenor Hospital School, Long Beach, Calif., Secretary.
- Conference of State and Provincial Health Authorities of North America, Vancouver, B. C., June 22-24. Dr. A. J. Chesley, State Department of Health, St. Paul, Minn., Secretary.
- Maine Medical Association, Rangeley, June 21-23. Miss Rebekah Gardner, 22 Arsenal St., Portland, Secretary.
- Massachusetts Medical Society, Springfield, June 8-10. Dr. Alexander S. Begg, 8 The Fenway, Boston, Secretary.
- Medical Library Association, St. Paul, June 22-24. Miss Janet Doe, 2 E. 103d St., New York, Secretary.
- Montana Medical Association of Billings, July 8-9. Dr. E. G. Balsam, 208½ North Broadway, Billings, Secretary.
- North Pacific Pediatric Society, Victoria, B. C., June 24-25. Dr. M. L. Bridgeman, 1020 S. W. Taylor St., Portland, Ore., Secretary.
- Pacific Northwest Medical Association, Portland, Ore., July 8-11. Dr. C. W. Countryman, 407 Riverside Avenue, Spokane, Wash., Executive Secretary.
- West Virginia State Medical Association, Fairmont, June 8-10. Mr. Joe W. Savage, Public Library Bldg., Charleston, Executive Secretary.

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to Fellows of the Association and to individual subscribers to *THE JOURNAL* in continental United States and Canada for a period of three days. Periodicals are available from 1926 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 12 cents if two periodicals are requested). Periodicals published by the American Medical Association are not available for lending but may be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

**Physiology of the Small Intestine in Presence of Calcified Mesenteric Lymph Nodes.**—Golden observed disturbances in the physiology of the small intestine in seven cases which appeared to have been directly associated with calcified mesenteric lymph nodes. The patients suffered from abdominal pain. They all had calcified mesenteric lymph nodes. Spasm in the loop or loops of the small intestine adjacent to the nodes was noted roentgenologically in four cases, and at operation in another case. Delay in the passage of barium at the site of the calcified nodes was found in four cases. A nine hour ileal residue was present in two cases, and a twenty-four hour ileal residue in another two cases. Delay in the ileum was frequently associated with hypermotility of the proximal part of the small intestine. Active reversed peristalsis in the ileum—not a "pendulum" movement—was seen in one case. Delay in the emptying of the stomach, apparently of reflex origin, was found in four cases. The fact that two conditions occur together does not necessarily mean that one causes the other. However, these disturbances in the physiology of the small intestine seemed to take place in loops of intestine directly adjacent to calcified nodes. The puckering and contraction of the mesentery about them and the distortion of the blood vessels make it seem very likely that the nerve fibers are involved in the process. A mechanism for a disturbance in intestinal physiology would seem to be present. One manifestation of abnormal intestinal physiology observed in these cases is spasm, and spasm of the intestine offers at least one possible explanation for pain. Occasionally a patient says that pressure on the calcified node reproduces the pain for which relief is sought.

**Roentgen Treatment of Malignancy.**—From their experience with protracted fractional irradiation with hard radiation (0.21 angstrom maximal wavelength, 5 mm. copper equivalent filter), Merritt and Rathbone believe that there is a differential effect on skin or epidermoid structures as a group in contrast to connective tissue or the supporting body structures as the other group. When 0.5 mm. of copper filtration is used there

is a moderate difference in the lethal dose between skin and the underlying subcutaneous tissues. As the filter is decreased, with a corresponding softening of the beam, the lethal doses for skin and for the underlying connective tissue approach each other, but never meet. Conversely, as the filtration is increased to 5 mm. of copper, there is a marked widening of the lethal doses for skin and for subcutaneous tissue. Thus the authors feel that increasing the filtration is the best method at one's disposal for protecting the underlying subcutaneous tissues when giving a lethal skin dose. In their treatment of superficial malignant disorders they are impressed with the necessity of producing complete destruction of the skin, as they have yet to permanently destroy a squamous cell carcinoma with less than a blistering dose equivalent to a first degree burn. In the production of these reactions for large areas (15 by 5 cm. and over) heavy filtration is a necessity to insure healing. Heavy filtration is neither necessary nor advocated in giving blistering doses to very small areas, unless cartilage is eroded or involved. They base their conclusions on their daily observations in the treatment of skin carcinoma in which they can readily observe the immediate and late effect on both the tumor and the bed of the tumor. A tin filter qualitatively equivalent to 5 mm. of copper is described. Greater use of filtration equivalent to 5 mm. of copper at 220 kilovolts (peak) is advocated. With such filtration inoperable intra-abdominal malignant conditions are now brought into the field of radiotherapy. Four cases are presented which serve to illustrate the possible uses of increased filtration.

**Relation of Libman-Sacks Syndrome to Dermatology.**—Belote and Ratner cite a case believed to present the Libman-Sacks syndrome. They are impressed with the succession of infections. Otitis media, pyelitis, bronchopneumonia and again otitis media associated with joint symptoms, renal changes and an almost continuously septic type of temperature certainly seem to point to a sepsis, and yet to them one of the striking features of this group of cases, and of their case in particular, is the fact that repeated blood cultures have been negative.

They believe that this group should be classified as a subgroup of the cases presented by Osler. The question as to whether or not this eruption is actually disseminated lupus erythematosus is of extreme importance, for on its correct answer rests the identity of this condition and erythema multiforme. At the present time one cannot say that they are not grades of the same condition. From the clinical standpoint there is not the slightest doubt that the eruption in this condition resembles closely acute or subacute lupus erythematosus disseminatus. From the standpoint of microscopic changes in the skin in this case the authors are faced with a problem. If the views of Goeckerman and Montgomery are accepted the condition almost certainly is in the erythema multiforme group, not in that of acute lupus erythematosus disseminatus. If, however, the view of Satenstein that microscopically there is nothing in acute lupus erythematosus to distinguish it from erythema multiforme is accepted, it could be either. Kidney changes in acute lupus erythematosus disseminatus apparently are more severe and different in type from those shown in their case or those described for the Libman-Sacks syndrome. From the necropsy material the most important fact is the infrequency of endocarditis in cases in which lupus erythematosus disseminatus was diagnosed before death. When it is realized that, regardless of the changing concept, the original cases of the Libman-Sacks syndrome were predicated on the observation of an unusual verrucous endocarditis at necropsy, it lends color to the belief that this eruption probably is not lupus erythematosus disseminatus. The authors draw the following conclusions, which may be amenable to correction: 1. The so-called Libman-Sacks syndrome is a subvariety of the Osler erythema group. 2. The lupus erythematosus-like eruption of the Libman-Sacks syndrome is erythema multiforme, representing a bacteria-free phase of a previous sepsis.

**Aleukemic Myelosis with Cutaneous Nodules.**—Zimmerman and Curtis encountered a case of aleukemic myelosis with cutaneous nodules in which the white blood cell count was reduced from 300,000 to 3,000 by irradiation; it remained at that level for several weeks and then slowly rose to 178,000. During this remission no immature cells were noted in the blood smears, and the patient's physical condition improved remarkably. The case was characterized by a sudden onset of hemorrhagic purpura, resulting in rapidly developing and fatal anemia. The absence of palpable glandular hyperplasia and the presence of the most immature type of white blood cells were noteworthy clinical observations. In a case of the diffuse form of an aleukemic process, diagnosis of the type may be difficult because of the immaturity of the cells. The stem cells containing no granules give a negative reaction for oxidase. This was the authors' experience in their case. After a transfusion of blood, some of the immature cells higher in the stage of development, such as myelocytes, stained characteristically, while the blast forms remained unstained. Schultze's modification of the indophenol blue synthesis, which causes a positive reaction in a case of myeloid leukemia and a negative reaction in a case of lymphatic leukemia, is of diagnostic aid. The life expectancy in the most favorable case is less than six months. Roentgen therapy is contraindicated, and transfusions of blood accord only a temporary arrest of the fatal termination in most cases. In a negligible few the chronic form is induced.

**Lymphedema Occurring with Varicose Veins.**—Biegeleisen purposes to trace the chronic disorder of lymphedema back to its source and to present a new mode of therapy for its relief. The name lymphedema describes only the first stage of the disorder. The end stage is fibrosis, and therefore the whole picture would be more aptly termed fibrolymphedema. The intimate relationship of the venous and lymphatic vessels in the lower extremity was amply brought out by Cruikshank. Phlebitis may cause lymphatic infection, with resulting lymph stasis. This lymphatic block is responsible for the alteration of the tissue known as lymphedema. The lymphatic system may be disturbed by other causes (cutaneous infection by an organism, trauma, filariasis and congenital lymphatic disorders). Whatever its origin, the end result is always the same. Obvious painful phlebitis may precede the hardened discolored lesion or the lesion may supervene on a latent phlebitis to cause an apparently idiopathic lesion. Varicose ulcers may

also be the starting point of lymphedema. In this type of involvement the cutaneous infection travels directly into the lymphatics. Once an ulcer is established in an area of lymphedema, healing is obstinate and rare. The lymphedematous process tends to advance. With widespread lymphedema of the entire leg, a condition of elephantiasis may be said to be present. In a case of elephantiasis accompanying varicose veins one does not encounter those acute crises of pain and fever that are noted in cases of other types of the disease. The author's technic, which he has used more than 500 times, attacks the seat of the disturbance in a direct fashion: The principle of the treatment is to open the strangulated lymphatic and capillary circulation. This is done by the injection of Locke's modification of sodium chloride solution through a 13 gage needle with a large bore, directly into the lymphedematous area. Injections are given as often as possible, since they do not inconvenience the patient. A reaction does not occur; the latent infection which is residual in the lymphedematous area is never aroused. In cases of both lymphedema and elephantiasis, subjective improvement is marked after the first few treatments. The pain in a case of lymphedema disappears, and the leg feels lighter and more natural. In every case in which the treatment has been persistently applied, the tissues have first become softer. With the softening of the tissues, the pigmentation becomes lighter and sometimes disappears completely. Lymphatic ulcers clear up definitely. The parts treated become less tender, and the patient loses the leathery sensation that existed before the treatment. The spread of the lymphedematous process stops. The end results obtained depend on the amount of healthy fibrous tissue present in the area, the size of the lesion and the persistence of treatment. The mode of action of this form of therapy is not clear. The results obtained have been so uniformly gratifying that the author presents this report to encourage further study.

**Prevention of Dermatitis Venenata.**—Molitch and Poliakoff tested the efficacy of poison ivy extract for purposes of immunization. The product used was an alcoholic extract (1:50) of the poison ivy plant made according to the method of Spain and Cooke. Patch tests were done on 292 boys with poison ivy extract in a dilution of 1:100, with an incidence of 22.9 per cent positive reactions. A majority of the boys with positive reactions also gave a history of previous attacks. Forty boys with positive reactions to the patch tests were given injections of poison ivy extract during the entire season, and not one had dermatitis venenata during the course of treatment. Fifty-three children who were not treated contracted ivy poisoning. It is recommended that all children with a history of previous attacks of ivy poisoning be given injections of poison ivy extract during the period of exposure to the plant.

**Gastro-Intestinal Allergy in Childhood.**—Ott is convinced that a great many of the cases of colic in infancy are merely manifestations of food allergy. This is true even in the breast fed infant, as the offending proteins may be excreted in the breast milk. When the gastro-intestinal disturbance is associated with eczema, even in the mildest degree, this probability is greatly increased. Allergic disturbances due to foods may simulate practically any disorder of the gastro-intestinal tract and allergy must be ruled out in any individual who is known to be allergic. During recent years migraine has been

added to the list of disorders that may be allergic. While no one contends that all migraines are allergic, evidence is accumulating that many of them are. The symptomatology in childhood often varies from that in adults in that the headache may be very slight and entirely overlooked. These children often complain of "dizziness" rather than a headache, but as they grow older the dizziness is replaced by the typical headache. Furthermore in migraine in children there is a picture of periodic gastro-intestinal upsets associated with all the symptoms of migraine which may be overlooked, because the headache is not a predominating symptom. The fact that the child has any headache whatever may be elicited with difficulty and only after careful questioning. Children who have or have had cyclic vomiting commonly develop migraine in later years. The symptomatology of cyclic vomiting and migraine are identical except for the symptom of headache. The author agrees with Balyeat when he states that "symptoms diagnosed as cyclic vomiting in a child with other allergic diseases or whose family tree is saturated with allergy mean migraine." Three cases of migraine are presented in which almost complete relief was obtained by the elimination of certain foods from the diet.

**The Chronic Effects of Trichlorethylene.**—Taylor investigated the chronic effects of trichlorethylene. Preliminary experiments showed that concentrations in air of 0.5 and 0.4 per cent trichlorethylene vapor produced deep anesthesia in rats, while 0.2 per cent gave only slight narcosis. As a result of these experiments the chronic effects of trichlorethylene were investigated at concentrations of 0.3, 0.2, 0.1 and 0.05 per cent, respectively, with rats as the experimental animals. Two dogs were also exposed to 0.2 per cent trichlorethylene. The experiments were continued for six months, the exposure lasting six hours each day, five days a week. A concentration of 0.3 per cent proved too high and only two of the original six rats survived six months. All the animals in the other concentrations survived with the exception of one accidentally killed in the 0.05 per cent concentration. There was no significant difference between growth curves and similar ones for litter mate controls. Histologic examinations of the livers,

kidneys, lungs, tracheas, hearts, spleens, brains and femurs of the experimental rats gave no signs of degeneration in any of the organs. The only abnormal feature observed was a slightly greater tendency to alveolar collapse in the experimental rats as compared with the controls. There was no consolidation or edema. This collapse is generally observed in laboratory rats, and it appears that there is no evidence that the collapse was due to trichlorethylene.

**Antirachitic Value of Crystalline Vitamin D.**—To determine the prophylactic dosage of crystalline vitamin D, as well as the influence of the menstruum on the effectiveness of this antirachitic substance, Lewis gave 441 young infants, at the beginning of the winter, 145, 290 or 1,450 U. S. P. X (revised 1934) units of crystalline vitamin D incorporated in 28 ounces (840 cc.) of milk, in 7 drops (0.5 cc.) of corn oil or propylene glycol. At the end of the winter the results demonstrated that rickets developed less frequently in infants receiving crystalline vitamin D in the daily ration of milk than in those receiving a comparable number of units of this antirachitic agent in 7 drops of corn oil or of propylene glycol. It was found that 1,450 units of crystalline vitamin D in oil daily protected forty-one of forty-two infants against rickets. The addition of 332 U. S. P. units of crystalline vitamin D to the quart of milk provided a highly satisfactory antirachitic, milk since only one of fifty-one infants receiving milk of this unitage developed rickets.

Use of Roentgen Ray in Diagnosis of Ileus. H. H. Schneider, Kansas City.—p. 148.

**Idiopathic Hypochromic Anemia.**—Snyder suggests that in the majority of patients with idiopathic hypochromic anemia there is no history of dietary deficiency and there are many points suggesting that the condition is due to some difficulty in the absorption or utilization of iron by the body. Achlorhydria is almost a constant observation in this condition as it is in pernicious anemia and, as has been pointed out by many, the achlorhydria may be indicative of some defect in the stomach resulting in the diminution of a substance in the gastric secretion that is necessary in the digestion of iron containing foods. Absence or reduction of this element could, by creating a state of iron deficiency in the body, produce anemia

of varying degrees just as absence of the X factor in the gastric secretions will cause pernicious anemia. Whether there is a direct relationship of achlorhydria to this type of anemia is a moot question. It is agreed that anemia is much more common among patients with achlorhydria than among those with normal gastric acidity. That the achlorhydria is merely an indicator of some missing substance in the stomach necessary for normal blood formation appears to be a more likely conception. While the symptomatology of the two diseases is somewhat alike, the blood shows almost directly opposite changes. The two diseases should offer little diagnostic confusion except in an atypical or borderline case. Hypochromic anemia with achlorhydria due to loss of blood, infections or toxemias should not be classified with the idiopathic group but should be called secondary hypochromic anemia or symptomatic achlorhydric anemia. The disease responds in a striking manner to adequate iron therapy. A case is reported that required unusually large doses of iron permanently.

**Pulmonary Tuberculosis in Puerto Rico.**—Rodríguez Pastor and Ruiz Cestero interpreted the roentgenograms of the chests of 1,000 Puerto Rican patients suffering from pulmonary tuberculosis. One or both apexes were involved in 82 per cent of the cases, the right apex being affected nearly twice as often as the left. In 18 per cent the apexes were clear. The lesions were limited to the upper third of one or both lungs in 46 per cent, to the middle third in 9 per cent and to the lower third in 1.5 per cent. Involvement of the upper two thirds of one or both lungs occurred fourteen times more frequently than involvement of the lower two thirds. In 8 per cent both lungs were involved. The preponderant form of tuberculosis was the fibrocaceous. In 48 per cent, exudative infiltration predominated, while in 52 per cent fibrous infiltration was equal in extent or predominated over the destructive processes. Although patches of caseous pneumonic infiltration were frequent, massive tuberculous pneumonias were distinctly rare. No significant differences could be made out between the forms of tuberculosis occurring in white patients as distinguished from that in Negro patients. Cavities were found in 56 per cent and occurred in 48 per cent more frequently in the right lung than in the left. The frequent location of cavities was the upper thirds of the lungs; next, the middle thirds. Peaking of the diaphragm, marked blurring of the cardiophrenic angle and similar diaphragmatic irregularities interpreted as adhesions were evident in 59 per cent. They were visible six times more frequently in the right than in the left side. Marked deformities due to fibrous tissue, such as displacement of the heart and trachea, were found in 8 per cent of the cases. Total atelectasis of one lung was present in forty cases. Pleural effusions were encountered in only eight cases.

**Von Gierke's Disease Associated with Amylorrhea.**—Naish and Gumpert describe a case of von Gierke's (glycogen accumulation) disease in which the presence of amylorrhea, a new manifestation, was observed. They suggest that there are in this condition an inability on the part of the liver to convert animal starch (glycogen) into dextrose and an impaired digestion of vegetable starch in the intestine. Possible mechanisms are discussed, and it is suggested that there is either (1) a disturbance of the  $pH$  in the immediate neighborhood of the glycogen in the liver cells and in the immediate neighborhood of the starch grains in the intestine or (2) an endocrine disturbance, quite distinct from the more familiar ones in that the balance which normally exists between the carbohydrate metabolism hormone of the anterior lobe of the pituitary and insulin is upset. Experimental and clinical observations give strong support to the endocrine theory of origin of this condition. They suggest that the normal balance which obtains between the pituitary body and insulin is disturbed. To account for the amylorrhea is more difficult. So far as the authors know, neither the pituitary body nor its satellites (the adrenal and the thyroid) are concerned with the intestinal digestion of starch, but it has been shown recently by Dodds and his co-workers that the posterior lobe of the pituitary body contains a substance capable of inducing a severe lesion of the acid-bearing area of the stomach—sometimes hemorrhagic and sometimes of the nature of a chronic ulcer. Furthermore, the stomach of an animal that has received an injection of this pituitary extract will not yield hydrochloric acid even after the injection of histamine. It is therefore not inconceivable that the pituitary may have some relation to the interaction of amylase and starch in the small intestine, if only from the point of view of hydrogen ion concentration.

**Water Intake and Reduced Cooling Powers.**—Gregory and Lee describe experiments in which unacclimatized male subjects were exposed to an atmosphere of 95 F. "effective temperature" for six hours and given 100 or 150 cc. of water to drink at intervals of fifteen minutes. It was found that: 1. Maintenance of bodily hydration markedly increases the stability of the thermal equilibrium and reduces the degree of shift of the equilibrium point. 2. The rate of sweating is somewhat increased in the water fed as compared with the subject deprived of water; this may be sufficient to account for the differences in thermal behavior. 3. The circulatory functions are rendered more efficient by hydration, as shown by the increased stability of cardiac rate, its lowered deviation

from normal and the reduction of symptoms referable to inefficient circulation. 4. There is a definite reduction of urinary chloride excretion during exposure to heat, no matter what the urinary volume. 5. Apart from the concentration of blood consequent on dehydration, there tends to be a decrease during exposure to heat of the ratio between water and protein in the serum. 6. Reduction of urine output below the normal "basal" level found in temperate atmospheres will not occur before a certain level of body dehydration is achieved. 7. Certain disturbances in the acid-base equilibrium of venous blood reduction of carbon dioxide combining power and carbon dioxide content tend to occur during exposure to moderate heat.

**Scarlet Fever and the Clinician.**—Hobson quotes clinical cases which he believes prove that: 1. An erythema is inconstant in infections due to a hemolytic streptococcus. 2. It may be a feature of those due to a nonhemolytic streptococcus. 3. Though it is more frequent in infections due to hemolytic streptococci, it is a poor guide to the course, prognosis or infectivity of the disease in a given patient. 4. Infections due to hemolytic streptococci with or without an erythema are generally highly toxic and highly infectious and have a striking association with sequels of all kinds. The appearance of an erythema is probably a favorable sign. 5. An infection due to a nonhemolytic streptococcus may have sequels in no way distinguishable from those due to a hemolytic strain, whether there is an erythema or not. If the foregoing statements and conclusions are sound, the author believes that it is pertinent to consider what alterations or modifications of clinical practice and teaching should be introduced. 1. The executive and primary object of notification is to segregate those liable to spread an epidemic disease. It is admitted by every medical officer of health that strict hospitalization in cases of streptococcal fever in which a rash develops has completely failed to control epidemics, and this is supported by clinical evidence. The notification of "scarlet fever" as at present practiced serves no useful purpose. It confines valuable hospital accommodation to a selected group. The accommodation could be better employed for cases of streptococcal infections selected on clinical grounds or for domestic reasons rather than by an erythema. A much higher standard of isolation is essential because the inmates are not all suffering from the same disease. 2. The public is still prone to regard tonsillitis as a trivial complaint and is still uninformed of the disasters that may follow the neglect of simple precautions; the profession has in this respect neglected its educational function. Isolation of the patient in the home, the use of separate feeding utensils and masking or gargling by the attendants are generally neglected and should be enforced. To confine patients to bed for a minimum of from seven to ten days and to examine the urine in the third week are two measures of obvious clinical value. 3. The use of a swab as a public health measure could, with value to the clinician, be employed not only to identify the Klebs-Löffler bacillus but also the hemolytic or nonhemolytic streptococcus. 4. An increasing number of experienced clinicians believe that it is of proved value to give so-called antiscarlatinal serum in the early therapy of infections due to hemolytic streptococci to relieve symptoms and to prevent complications. The public health service should therefore provide the serum for use in hemolytic infections on the same basis as it provides serum for the treatment of diphtheria.

\*Artificially Produced Hyperchloridemia. R. S. Mach and F. Sciclounoff.—p. 431.

**Diagnosis of Pancreatic Disorders.**—Chiray and Bolgert discuss the imperfections and the physiologic tests of the pancreatic function. They propose a new technic for studying the pancreatic secretion. It involves the intravenous injection of two ampules of secretion with the subsequent withdrawal of bile from the duodenum. The lipase and trypsin are estimated by the usual method, but, instead of expressing the results as a curve for each diastase, the arithmetical mean is estimated and recorded. Thus the lowest lipase and the lowest trypsin activities are determined. The authors conclude from their studies that, if the lowest diastatic activity is normal with a normal volume or above normal volume, no correction is necessary. If the diastatic activity is lower with a normal or low volume, still no correction is necessary. On the other hand, if the volume is higher, the coefficient has to be divided by 0.7 in order to obtain an approximate value for a volume of 100 cc. If the diastatic activity is normal with a volume below 70 cc., the coefficient is divided by 1.4 for a volume between 70 and 35 cc. and by 2 for a volume around 25 cc. Whatever the value of the lowest diastatic activity, if the volume is above 200 cc., the correction must be made by following a given arithmetical formula.

**Artificially Produced Hyperchloridemia.**—Mach and Sciclounoff attempted to find a method of replacing the isolated measurement of the blood chloride by a functional test which employs the rapidity of absorption of the injection of these salts. They studied in normal persons and in patients in a state of hypochloridemia the blood chloride level after the intravenous injection of 8 Gm. of sodium chloride. They concluded from their observations that sodium chloride injected in the veins of a normal subject disappears from the blood in a few minutes and is fixed in the tissues. Sodium chloride injected in the veins of a subject in a state of hypochloridemia produces an ephemeral elevation of the blood chloride which in one hour practically returns to its original level. The level of the blood chloride in the rechloridated subject does not depend on the value of the dose injected but on the affinity of the tissues for the sodium chloride and their state of saturation. In the course of a treatment of rechloridation by daily injection of sodium chloride the blood chloride is raised slowly and according to the degree to which the tissues are saturated.

**Heterotopic Osteogenesis from Epithelium of Urinary Tract.**—Lucinisco and Cavalli report the results of experiments in dogs and rabbits for the production of heterotopic ossification obtained by the following procedures: (1) transplantation of epithelium of the urinary tract (mucosa of the bladder, the ureter and the renal pelvis) into young connective tissues, (2) transplantation of fascia lata into vesical defects and (3) interruption of renal blood circulation by ligation of the renal vessels. The authors conclude that the epithelium of the urinary tract has the property of producing heterotopic ossification of young connective tissues. The property seems to be due to a substance secreted or liberated by the urinary epithelium, which causes precipitation of calcium salts on the collagen fibers. Heterotopic ossification obtained by ligation of the renal vessels is identical to that obtained by transplantation of fascia into vesical defects or urinary epithelium into connective tissues. In all cases the bone metaplasia is due to the presence of urinary epithelium and it takes place in the connective tissues in the vicinity of the epithelium, either trans-

planted (transplantation of urinary epithelium) or naturally present in the structure (transplantation of fascia into vesical defects and ligation of renal vessels), but in both cases without the presence of preexisting bone cells. Osteoblasts from fibroblasts make their appearance when precipitation and fixation of calcium first take place. The classic epithelial disposition of osteoblasts around the connective tissues in process of ossification is seen only in rare cases. Periosteum is a differentiated element of the connective tissues which surrounds the bone formation late in the process of ossification, in which it seems to play no osteogenic part. In the process of ossification bone trabeculae surround the ossifying zones, in the center of which a thin net of histiocytes and cells of bone marrow with the typical characteristics of young bone tissue appear.

**Treatment of Gonorrhea by Basic Fuchsin.**—Araya reports satisfactory results from the use of a combined treatment of basic fuchsin (parafuchsin methylhydrochlorate or parafuchsin acetate) and aniline in urogenital gonorrhea in women. The solution is prepared with chemically pure basic fuchsin 1 Gm., pure aniline 2.5 Gm., glycerin 10 Gm. and enough distilled water to make 100 cc. The treatment consists in the use of two daily vaginal douches made up of 2 liters of boiled water containing a teaspoonful of the solution and, if possible, a short irrigation with part of this solution in the urethra when infected, and every other day an intra-urethral injection of 2 cc. of the solution and introduction of a strip of gauze, soaked in the solution, in the cervical canal, where it should be retained for a few hours. If Skene's and the periurethral glands are infected they should be treated with the solution. The treatment may also consist in the use of intravaginal ovules prepared with pure basic fuchsin 1 Gm., gelatin 10 Gm., distilled water 30 cc. and glycerin 60 Gm., the patient taking one each night for nine consecutive nights. If the body of the uterus is infected an intra-uterine injection of 1 cc. of the solution is given, except in cases of uterine retroflexion, in which it is contraindicated because of the possibility of complete absorption of the dye by the uterus. Basic fuchsin penetrates deeply the mucous membranes of the urogenital tract, as proved by histologic studies made by the author. It has a selective bactericidal action on the gonococcus. Its power of penetration into the mucous membranes of the urogenital tract is increased by the power of absorption of the membranes. Its bactericidal properties are increased by its association with aniline to such an extent that even a 1:20,000 solution inhibits the cultural development of the gonococcus in peptone bouillon or ascitic agar left for three days in the incubator.

 Nonspecific Therapy of Infectious Diseases. H. Lotze.—p. 479.  
 \*Question of Male Climacteric and Its Treatment. W. von Noorden.—p. 484.

**Influence of Bile on Resorption of Vitamin C.**—According to Klodt, experimentation with cevitamic acid is difficult because of the extremely unstable character of its solutions. Cevitamic acid is readily absorbed in the organism, and it may be assumed that the human and animal organisms have substances that stabilize the cevitamic acid so that it reaches the small intestine unchanged. The resorption takes place chiefly in the upper part of the small intestine. The author made a study of the close relationship to bile that could be detected in investigations on the fate of cevitamic acid in the digestive tract. 1. He found that the bile of man, cattle and sheep considerably retards the oxidation of dilute solutions of cevitamic acid and thus facilitates their resorption in the small intestine.

2. Human and animal bile contain reducing substances that are not identical with cevitamic acid. 3. Bile does not reduce dehydrocevitamic acid. 4. The decomposition of the cevitamic acid in plant juices is likewise considerably retarded by bile.

**Question of Male Climacteric.**—Von Noorden emphasizes that there is no physiologic threshold beyond which in men, as in women, another physiologic phase begins and that there is no justification to speak of a male climacteric and place it in the years after 50. Such a term as male climacteric does not belong in the textbooks of physiology and pathology. To apply the term to psychic and physical defects that appear with greater frequency at the transition from the second to the third period of life may be permissible but is not advisable, since a physiologic significance may be applied to it. The author concedes that external circumstances may cause changes in a man, but they have no physiologic cause and a comparison with the life threshold which a woman has to pass at the time of the climacteric is inadmissible for physiologic and biologic reasons. The changes that develop in men in the corresponding age originate in all sorts of disturbances and in various conditions of the milieu and of civilized life and, as far as the latter are concerned, are practically unknown to primitive men. *Physical and psychic disorders are not restricted to a certain time but rather lead toward old age.* Regarding the treatment, the author says that sane attitudes and a natural mode of life are most important. Gonadal therapy is important, even if its action is perhaps only suggestive.

**Sedimentation Reaction in Coronary Thrombosis.**—Christensen finds that the sedimentation reaction is of great diagnostic and prognostic value in coronary thrombosis and myocardial infarct. The sedimentation reaction always rises after some days of the disturbance; a normal sedimentation reaction in a patient with cardiac pain for some time or for a longer time thus makes the diagnosis of coronary thrombosis improbable. A sedimentation reaction constantly increasing to high values is an unfavorable prognostic sign, while a slow and gradual decrease is a favorable indication.
